The time was when Potatoes were in many instances spread out in the sun, in order to dry them before storing in the earth. No practice could be worse, for the reasons above stated; and, moreover, the object in view, that of rendering them ultimately drier and better in quality, was not attained. On the contrary, although deprived of a portion of their moisture in the first instance, yet this only left room for the absorption of moisture contaminated with gases generated in the cave. Such gases will be generated in greater quantity if straw, or other vegetable substances, apt to decay, are employed as a covering next the Potatoes. Fine white-fleshed Kidney Potatoes have been known to be tinged yellow throughout in consequence of having been covered with straw. The straw was no doubt dry when used, but it soon acquired damp, and the conditions of decay, from the layer of earth resting upon it. Potatoes so tainted are said to taste of straw, or, in other words, to possess that well-known musty flavour which decaying straw communicates. The bad quality imparted being so easily traced to this material, it is surprising that straw should continue to be so much employed in contact with Potatoes.

Some persons may perhaps grant that the least possible exposure to light should take place between taking up and storing, and yet may consider it necessary that Potatoes taken up in a very wet state should be dried previously to being stored, in order to avoid a greater evil than that resulting from exposure, namely, their rotting. It has, however, been found, that although Potatoes were taken up and immediately stored in the earth, in moderate quantities, with the mud so wet as to be dripping through the baskets, yet those Potatoes presented as dry an appearance when uncovered in spring as others that were stored in a dry condition. In the former case it may be presumed that part of the excess of moisture would descend to the bottom of the pit and there drain off; moreover, that when the covering of earth became colder than the Potatoes and the water on their surfaces, the latter would be gradually condensed on the particles of surrounding soil, the process continuing so long as the tubers maintained a higher degree of temperature.

As the season for taking up the crop is approaching, the preceding observations may be turned to account by secluding the tubers from light as expeditiously as possible. To do this will require little or no additional expense; while great superiority in the quality of the crop will be insured.

Having thus pointed out one of the sources of deterioration, it may be as well to name a means of improvement. Always dry the tubers before cooking them—still, however, in the dark. If a Potato is weighed when fresh taken up, then laid in a dry warm place for some time, and again weighed, it will be found to have become lighter in consequence of the evaporation of a portion of its water, and it will then in boiling be more flowery. In Ireland, with this in view, Potatoes, when watery, are often taken out of the caves and kept in a dry place for a few weeks, and a great improvement is the consequence. The French are aware of the same fact. A writer in the *Revue Horticole* says—"In unfavourable seasons, Potatoes are often found to be watery and without flavour, although cooked with the greatest care. In this case the mode of effecting an amelioration is easy; it consists in placing them near a stove or oven for about a week previously to their being used. At the end of that time they will be found mealy and of good flavour." Objects of vast importance are sometimes attained by very simple means; and we regard that to which the foregoing remarks apply as one by no means undeserving consideration.—*R.*

REMARKS ON MR. HOARE'S NEW BOOK ON THE VINE.

I HAVE just met, for the first time, with this book; and, with all due deference to Mr. Hoare, I would wish to make a few remarks on certain passages. Before venturing, however, on such a liberty I must observe, that so far from denying any of the first principles in the cultivation of this valuable fruit, on which Mr. H. takes his stand, I would wish to add my testimony to their immense importance. No writer has, in my opinion, ever thrown so much light on the habits of the Vine before, and his work will, I make no doubt, silently effect as great a change in the culture of Vines (confined as it has been to mere rules), as Mr. Hamilton's book is likely to do in the culture of the Pine-apple, when his system shall be thoroughly appreciated. New systems, however, frequently push things to inconvenient extremes; and it is this that I wish to notice.

Constant and uniform action of root in the growing season is, no doubt, as Mr. H. justly observes, the great desideratum; the greatest obstacle to this in our climate is undoubtedly those dashing rains which occur in most summers, and by which the ground is saturated and choked for sometimes a week or a fortnight together; in which case those borders must be well drained and constituted indeed, in which the rootlets do not become discoloured and lose part of their lively action. Thorough drainage, shallow borders of not more than a foot, a due attention to the mechanical texture of the soil, with a judicious application of top-dressings of rich rotten manure in times of drought, will be found, I imagine, the surest recipe in our cool and damp climate.

I should recommend those inexperienced in Vine-border making, to compromise Mr. H.'s plan, by using abundance of his materials at the bottom of the compost over the drainage, and uniting the well-known permanency of chopped turf from very old pastures, with the porosity of the other materials, for one foot on the surface. In this case it would be advisable to use Mr. H.'s rough materials in larger lumps.

At page 21 of Mr. Hoare's work he makes some excellent remarks on what takes place in the great majority of cases with early-forced Vines, the roots of which are outside. But here I conceive that in adhering too tenaciously to his own doctrines, he has, with that ardour peculiar to those who make new discoveries, somewhat overcharged the consequences of the old and erroneous method. Erroneous! Yet, strange to say, excellent Grapes have been obtained by it, and that in a host of cases. Not that I would by any means advocate it, but all facts bearing on so important a subject should be freely stated.

Now, Mr. H. seems to consider that it is what he terms "the maturative power" alone that is drawn upon in this case, and that the vegetative power has no part or lot in the affair. Now, the Scotch folk have a saying, I think, that will nearly describe the position such Vines are placed in, viz., "all going out of the meal tub, and none putting in, soon gets to the bottom."

I have seen an old Willow truncheon as thick as any ordinary-sized tree, lie in a humid situation after being felled, and there vegetate for several years. However, had this Willow carried annually many pounds weight of fruit in such a situation, it would, I have no doubt, received its *quietus* betimes.

If, therefore, the following quotations be correct, a Vine truncheon would force as well as an established plant with roots. Thus, Mr. H. on this subject says:—"Unless, therefore, artificial means be used to make the roots move before their natural time, an early-forced Vine will present the very singular anomaly of having produced a vast mass of foliage and a matured crop of Grapes, before the roots can have contributed anything towards their support."

I have been thus prolix merely to exhibit the case fairly, and to say in conclusion, that in my opinion the reciprocal action between root and branches is much greater than Mr. H. supposes; or Vines that have come "within our ken" could never have existed as they have done, and yet carry crops. The vital energies of plants are amazing, or how could they contend with the various difficulties with which they are beset?

Mr. H., at this section of his book, speaks of short-jointed wood, the well known criterion of fruitfulness in most trees. In allusion to a bundle of Vine cuttings received from Spain, he most judiciously describes, and proves the influence of heat (day?), and more especially light, in producing such wood. This is all excellent; and I could only lament one thing, viz., his omission of the injurious effects of overhigh night temperature, about which he has said nothing. Now, the matters of heat and light being entirely relative, are not to be handled in an abstract and cursory way. However, we have been so long hedged about with mere rules, that we dare not boldly descend to the night temperature which Nature herself prescribes; and why? If we should fail, all the world would laugh, while our employers would frown. Now, having less solar light in the day than in tropical climates, there exists a greater occasion for even less night heat than nature points to, in those climes where the Vine in indigenous.

At page 15, Mr. H. says:—"In no part of the world can a Vine be made to produce a single Grape more than it otherwise would do, by the exclusive agency of anything added to the soil, in the shape of a stimulant, except under the circumstances hereafter mentioned." Admitted: but stimulants may, in this case, yea, and do increase the size of the berry, and consequently the ultimate produce; and fine swelled berries are, and perhaps ever will be, highly esteemed.

I have much doubt about the utility of Mr. H.'s cylinders, or columns, of which he treats at page 64. This mode, by its simplicity, may recommend itself in some of the southern counties, but can never spread very far. Absorption of heat during sunshine, and the consequent radiation after, enhancing the value of the atmosphere in the immediate neighbourhood of the absorption, is of such value to tender fruits, that no plan by which the solar heat may be dispersed as fast as it accumulates, can be expected to answer; and this objection I imagine the column would be liable to. Blow from what quarter it choosed, the wind would eddy round the column.

I feel assured that shanking, shrivelling, want of colour, and a host of other evils, are produced by irregular and imperfect action of the root in the growing season, chiefly through glutting rains causing for a while utter stagnation in soils of bad mechanical construction, almost impervious to the atmosphere, and of course averse to the passage of moisture. I care little in comparison about the imagined evils of inside temperature, only do not burn the leaves for want of air, or keep too high a night temperature, and the rest I would regard as secondary considerations.—*Robert Errington, Oulton.* [We are glad to find an experienced gardener like Mr. E. entertain opinions so similar to our own, which were printed before the above observations reached us.]

PRUNING FOREST-TREES, AS PRACTISED BY DR. THACKERAY IN HIS PLANTATIONS AT NERQUIS, IN FLINTSHIRE.

A GREAT deal having lately been written in praise of these plantations, and about the mode of pruning them

and conceiving from what had been reported of them that Dr. T.'s system of pruning was nearly similar to mine, which I have proved to be good, and have practised when opportunities offered, I was induced lately to go and see them, in order that I might judge for myself. I must say, however, that I was a little disappointed; but I, nevertheless, saw much to admire and praise.

The system of pruning pursued by Dr. T. is *à la Pontey* in the extreme, only in a different guise. The periods, seasons, and manner in which the operation is performed do not alter the nature of the system; and the same notion seems to be entertained as that of Pontey, viz., that the divesting a tree of its side branches increases the weight or bulk of timber in the trunk.

Dr. Thackeray and his panegyrists appear to think that the increase of timber in the trunk arises from the consolidation of what is termed the true sap or cambium in its descent, after it has been elaborated by the leaves; and that the sap is acquired chiefly by the roots from the soil. Now I am of a very different opinion; and have demonstrated by experiments—the results of which I have published in tables in a book entitled "Facts, Hints, &c.," about 20 years ago—that the increase of the girth, or circumference of the trunk of trees, depends entirely on the number and healthiness of the branches and leaves. I have there also shown, beyond a doubt, that Larches with numerous healthy branches and leaves increase in girth upwards of two inches annually, and that those having diseased leaves and only a few branches increase very little, if anything, in a season in girth. The same fact holds good with other trees. I could get up a tree in an exposed open situation as tall and slender as in a crowded plantation, merely by divesting it of its side branches as they are produced. As the increase of the timber in the trunk and branches is formed by the descending filaments or woody tissue from the annually-produced leaf-buds and shoots, and as every leaf-bud is a new member, and every branch a family, and the whole together a nation, as it were; therefore, to make it a large and strong tree, increase by all possible means the number and healthiness of the branches and leaves. Lopping off branches as they are produced, or too soon afterwards, makes trees tall, weak, puny things; in fact, you may get trees to grow as tall and slender, and that in a very short period, merely by divesting them prematurely of their side branches, as when they are growing in a crowded plantation without having been timely thinned out.

Dr. Thackeray's system of pruning is tolerably correct, but it is unmercifully overdone. I perceived that some parts of the plantations had been too long neglected before they had been thinned and pruned. Near the rides or roads there are certainly some fine Oak and Ash-trees; and the greater part of the Larches are good, but they are not what they might have been, and undoubtedly would have been, under a better system. With the exception of the specimens already mentioned, the greater part of the Oaks and Ash are not fine trees, and evidently show signs of having been injured by the Larches not having been sooner thinned out from among them, and also from having been pruned to excess; one object is, however, gained, viz. tall, straight, slender trees without side-branches, to a certain height, and which are only fit for ladders, rails, poles, or such like purposes.

Now, let any one who disputes what I have advanced concerning the increase of timber in the trunk, cut down a tree having numerous branches on one side and only a few on the other, and they will then see that the concentric annual rings are much wider on the side having the greater number of branches than on the other. I would also refer those who are sceptical to the indisputable demonstrations of the rapid growth of timber in trees having numerous branches, published last year in a pamphlet, by J. Hamerton, Esq.

The late writers who praise Dr. T.'s mode of pruning, all advocate the same thing, namely, that the increase of timber in the trunk is obtained from the sap derived from the soil, and that branches prevent the increase of timber in the trunk: they say that branches draw the sap from the trunk. This opinion I was accused of entertaining 24 years ago, when I began to foreshorten branches of the Larch where they had made vigorous and numerous shoots; and this was what induced me to make the experiments which I have published. Now I am fully convinced of the fact that the increase of timber in the trunk and branches is made by the descending filaments or woody tissue, from the annual leaf-buds and shoots. From the conflicting opinions about the pruning of forest-trees lately, I have avoided using the term pruning as much as possible, and substituted training of forest-trees in its stead. My system is to increase the number of branches when necessary, and to keep them of proper dimensions, and within a moderate compass, so as to insure a proper thickness and elongation of the stem, according to the kinds of trees and future purposes for which they may be required; but I never, by pruning off the side branches, deprive trees of the very means of increasing the trunk till that object is attained, and other branches produced to supply their places, when some of them might be taken off, or suffered to decay of themselves according to circumstances and the nature of the trees.

Dr. T. and the advocates of his mode of pruning, imagine that because he prunes his trees every year, and at all seasons of the year, and not at certain seasons or stated periods, that his method must be different from Pontey's and his copiers, but the result is the same in both cases; by cutting off the branches he deprives the tree of the means of increasing the timber in the trunk. I would not have noticed this subject again, had I not been convinced that the system is apt to establish a very erroneous mode of pruning, wholly opposed to the true means of increasing useful and valuable timber.

To contrast Dr. T.'s plantations with others very much neglected that are near them, and that were planted at the same time—as Mr. Scott Russell and some others have done—is not the way to form a correct opinion of their merits.

Notwithstanding the reported superiority of the treatment of the trees at Nerquis, compare them with some others I shall mention, on which no particular care or skill has been bestowed, but which have been left to struggle on as they could in crowded plantations, and see what the results are. The trees at Nerquis have been planted about 28 or 30 years. I took the circumference of two trees at four feet from the ground—a Larch and an Oak. They were considered to be among the best specimens; the Larch was 3 feet 2 inches in girth, and the Oak was 1 foot 7 inches in girth. There were some Ash trees about the same dimensions as those of the Oaks. The finest Larches would probably average from 2 feet to 3 feet in girth, and some of the Oaks from 1 foot to 1 foot 6 or 7 inches in girth. Now in a plantation—the property of Sir W. W. Wynne, in this neighbourhood on the side of a hill of a considerable elevation, and exposed to cold boisterous breezes from the Welsh mountains—I have lately measured trees, planted about 30 years ago, which have received no pruning, but have been occasionally thinned, the girth of which, at four feet from the ground, is as follows:—

Larches from	. .	3 ft. 3 in. to 4 ft. 7 in.
Oaks	,, ,,	2 ft. 6 in. to 2 ft. 7 in.
Ash	,, ,,	2 ft. 3 in. to 2 ft. 11 in.
And Elms were about		2 ft. 7 in. in girth.

These trees are as tall or taller than Dr. Thackeray's; in proportion to the branches on them the girth is invariably increased or diminished.

Larches are on an average from		3 ft. to 4 ft. 6 in. in girth.
Oaks are from	. . .	2 ft. to 2 ft. 7 in. ,,
And Ash are from	. .	2 ft. to 2 ft. 10 in. ,,

In another plantation at Llanforda, belonging to Sir H. Wynne, which is, however, certainly in a more favourable situation, and has a better aspect, there are trees planted about 28 years ago, on which no pruning has been performed, but which have been occasionally moderately thinned; the measurement of which, at 4 feet from the ground, is as follows:—viz.: Larches, 3 ft. 4 in., 4 ft., and 4 ft. 3 in., with numerous branches down nearly to the bottom; an Elm was 3 ft. 1 in. in girth; a Turkey Oak, 2 ft. 9 in.; common Oaks, 2 ft. 6 in., 2 ft. 8 in., and 2 ft. 10 in.; and a Spanish Chesnut, 2 ft. 6 in. At the same place a Silver Fir, planted in a shrubbery about 22 years ago, measures in girth 4 ft. 1 in.; all its branches annually increase in girth about 2 in. and 2-eighths; two Turkey Oaks, planted 22 years ago, are 3 ft. 7 in., and 3 ft. 8 in. in girth; all the branches annually increase in thickness about 2 inches. In a third plantation, the property of W. O. Gore, Esq., M.P. (an extensive planter), there is a noble Larch that was planted about 40 years ago. It measures in girth, at 4 ft. from the ground, 5 ft. 1 in., and contains fully 40 ft. of cubic timber. This shows what might be done under proper management. This tree, by mere chance, had never been over-crowded, and it was never pruned. In the same plantation, and under the same circumstances, is a Spruce Fir, which girths 5 ft. 3 in.; it is furnished with nearly all its branches. The staple and permanent trees here are chiefly Oaks, a very few of which measure from 2 ft. 6 in. to 3 ft. 3 in. in girth. The average girth is from 1 ft. 6 in. to 2 ft. 6 in. The trees are tall, and are drawn up weakly, with but few side-branches and not much top; all this results from the want of timely thinning and training. The slow growth in trunks of the Oak-trees is occasioned solely by neglect and want of skill; they ought to have averaged from 3 ft. to 4 ft. in girth during that time. The same result, to some extent, happens in Dr. T.'s plantations, on account of his mode of pruning.

Only imagine having a plantation of Larch at 40 years' growth, with from 140 to 200 trees on an acre, each containing 40 ft. of cubic timber; and I have no doubt but that an acre would produce and bring to maturity that number of Larches, as the trees would only be from 15 to 18 ft. apart, allowing the branches to extend each way from 2½ to 3 yards from the bole. And look again at another plantation, consisting chiefly of Larches, belonging to the same gentleman, on a high and very exposed situation, that have been planted about 24 years, and that are nearly all greatly injured for want of timely thinning—the very largest trees of which, and of those only a very few, measure 2 ft. 1 in., 2 ft. 7 in., and 2 ft. 9 in. in girth, at 4 feet from the ground. Again, at the Hayes, near Oswestry, in a very favourable situation as to soil, climate, and aspect, there is a plantation of Larches which have been planted 35 years; the ground on which they grow was previously an Oak wood. These Larches have been pruned much more severely than Dr. T.'s; they measure, at 4 feet from the ground, only 1 ft. 10 in., 2 ft. 1 in., and 2 ft. 9 in. in girth: reflect on this fact; Pontey is here exceeded. At the same place, and very near these Larches, is a Cedar of Lebanon; whose age, counting from the time seed was sown in a bed to the present time, is about 88 years; it measures 12 ft. in circumference, at 4 ft. from the ground. This, taking into consideration the slow growth in its infancy, is not much less than 2 inches of increase in girth annually. There are also here a Scotch Fir, 9 ft. in girth; a Larch, 9 ft. 1 in. in girth; and an evergreen Oak, 5 ft. 6 in. in girth. These are supposed to have been planted at the same time as the Cedar. They are growing singly, and have numerous branches. The length of the bole, from the ground to the first branch on each, is between 11 and 12 ft. That which has been spent in forming large branches might by art have been made to form valuable timber in an elongated trunk. I have mentioned these instances to show what a rapid growing tree the Cedar of Lebanon is, under favourable circumstances; and to contrast the difference between the preventive system of pruning, and pruning every year, and at all seasons of the year. This mode of pruning is generally understood to reduce the number of branches, instead of increasing and modifying them; and in that lies the error.

The following is a statement of the girth and height of some of the trees in the Royal Forests. They were planted about the same time as the Nerquis plantations, as will be seen by the dates. The measurement in girth was taken at 4 feet from the ground. Chopwell woods were planted in the years 1813-14-15. The size of trees in them, measured September, 1844, was—

	Girth. ft.	Girth. in.	Height. ft.
Larches	3	6	30
Elm	3	0	29
Oaks	2	4	28
Ash	2	3	28

Chopwell lies east of Carlisle, and is as cold, late, and bleak as North Wales. Nerquis lies west from Cheshire, and is bleak and cold. Dean Forest is situated in the southern part of South Wales; the situation is hilly and bleak. The following is the girth and height of trees in Dean Forest:—

		Girth. ft.	Girth. in.	hgt. ft.
1. Stapledge Hill, planted 1814.				
Oaks	1	2	5	32
	2	2	2	34
	3	2	7	37
2. Haywood Hill, 1810-11.				
Oaks	1	2	6	30
	2	2	3	30
	3	2	1	31
Larch	1	2	9	35
	2	2	8	31
	3	2	9	31
3. Blakeney Hill, 1813.				
Oaks	1	2	5	34
	2	2	6	35
	3	2	4	33
Spanish Chesnut	1	2	11	37
	*2	3	9	36
	*3	4	1	39
Ash	1	1	10	39
	2	1	8	33
	3	2	0	33

		Girth ft.	Girth in.	hgt ft.
3. Barnhill, 1810.				
Oaks	1	2	9	35
	2	2	11	34
	3	3	3	34
Spanish Chesnut	*1	3	2	34*
	2	3	4	35
	*3	4	5	42
Spruce Fir	*1	4	6	41
	2	4	0	42
	*3	4	5	43
4. Bromley Hill, 1813.				
Oaks	1	3	2	39
	2	2	10	35
	3	2	3	27
Spanish Chesnut	*1	3	7	40
	2	3	6	35
	*3	3	11½	38
Spruce Fir	1	3	2	35
	2	3	3	32
	3	2	9	39

Compare these trees with those at Nerquis—with the Larches at the Hayes—or with Oaks of 40 years' growth in Mr. Gore's plantations. Look at Barnhill, where a Chesnut only 34 years old measures in girth 3 feet 2 inches, and is nearly 40 feet in height, making an annual increase in girth of about 2½ inches; a Spruce Fir 4 feet 6 inches in girth, and 41 feet in height; and Oaks 3 feet 3 inches in girth, and 34 feet in height. At Bromley-hill, Oaks of 32 years' growth are 3 feet 2 inches in girth, and measure nearly 40 feet in height; in Chopwell woods, at 30 years old, they are 2 feet 4 inches in girth. It should be mentioned that the Oaks when planted in the Forest of Dean were much injured and destroyed by mice. I have little doubt but that I could have found Oaks, both in Dean Forest and in Chopwell woods, of larger dimensions; but it was my wish that the measurement should be taken from trees growing in the most exposed places, and at about the same altitude as those at Nerquis. Nearly all the Larches in these woods have been cut down, and no doubt the best were selected from among them. The trees in the Nerquis plantations have been divested of their side branches, from 15 feet to 20 feet in height on an average.

In conclusion, I protest against the "non-pruning advocates;" the adhering too closely to that doctrine is productive in most cases of as much injury to the real bulk and value of timber as over-pruning is. It is best to pursue a middle line between the two extremes, which is the preventive system of pruning. It is clear that we may regulate by skill and art the increase of the girth and elongation of the trunks to almost any proportions we please. —*W. Billington, Underhill, Oswestry, Salop.*

WEATHER-WISDOM.

THE vicissitudes of the seasons having such a powerful influence on the fortunes of the husbandman and the gardener, and modifying so much all the other employments and amusements of life, we cannot wonder that the universal propensity of human nature to pry into futurity should be exercised in the species of divination which has been rather quaintly, and with an air of sarcasm, called Weather-wisdom. It is curious to study the gradations of this folly, from the lofty delusions of Imlac's mad philosopher, who could "restrain the rage of the Dog-star, and mitigate the fervours of the Crab," and of the "Great Medicine," who brings rain on the prairies, down to the humble speculations of him who "thinks that it will rain because it looks black," or that "it will be fine to-morrow because the sun goes down red." But is it not surprising that notwithstanding the frequent failures of the most observant and best judging of this class of prophets, and the general conviction of well-informed persons of the utter futility of the predictions of meteorology, except as regard the broadest features of the year, from day to day we hear a repetition of the same absurdities?—not such as are idly and hastily broached in the greetings of casual rencontres, but gravely stated and put into print with all the solemnity of truth and

sound philosophy. Here is a specimen which I find in the "Spectator" of Sept. 7, copied from the "Nottingham Review," and which, if a paper of the "Spectator's" character thought worthy of notice at all, ought not to have allowed to go to its readers without denouncing as nonsense, all, at least, but the fact:—

"On Sunday last a large flock of wild geese passed over Chesterfield, on their way, it is supposed, to the fens of Lincolnshire. Such a circumstance at this early period of the season was hardly ever known, and it is considered to forebode an early and severe winter."

Not an autumn passes but we hear of such prognostics of a forthcoming hard winter, in spite of our experience of the fact, that five times out of six such prognostics fail; for it is only about once in as many years that we do have a severe winter. The temptation to this affectation of superior knowledge is so strong, that men even who are apparently engaged in the right road of investigation, and conversant with the means by which the exact results of meteorological observation are obtained, are led astray by it.

Articles appear from time to time in the *Times*, under the head of "London Weather," and are advanced by that useful paper with a show of a faithful record of facts, and reasonable deductions therefrom, on known philosophical principles. The author of these papers often betrays a disposition to foretell the chances of a few days prospectively. About a week ago we were told that certain electrical conditions of the atmosphere existed, and that a gale was probably at hand. Now I would challenge the writer to show what are the express electrical phenomena indicative of an approaching gale, which do not frequently exist without any such result—for no great atmospheric changes take place without manifestations of electric agency. The prediction was a tolerably safe one; for who does not know that the equinox is come, and that the month of September seldom goes out without a little foretaste of the agitations of the declining year?

If we are ever to have anything better than an empirical knowledge of the course of our seasons, it would be better to refrain from such pretensions till they can be warranted by well-grounded deductions from a long series of recorded facts and observations, collected simultaneously (as they must be, to be of any use) at many and widely-extended points. One of the most remarkable instances of the danger of venturing on this species of vaticination I remember to have happened about the years 1814 or 1815. Two or three succeeding summers had been excessively wet and cold, and an article appeared in the "Quarterly Review," in which conjectures were advanced respecting the concomitant existence of a greater than usual extension of the ice of the Northern Atlantic, and with a confident prediction that, as icebergs were still floating in very low latitudes, we must expect to suffer a continuance of the evil for one more season at least. This article had hardly reached the public when there commenced one of the warmest and finest summers ever known, (I think the summer of 1816). It begun in May, of which the first part was wet and warm; it cleared up about the middle of the month, and it continued almost uninterrupted sunshine till after harvest: the Pomegranate was ripened in the south of England, and Melons were raised with no other artificial help than the protection of a handglass. The succeeding autumn was beautiful, and the winter mild.

In concluding these cursory observations on so important a subject in all the relations of rural life as meteorology, permit me to express a hope that you will, ere long, indulge us with a Paper, or series of Papers, on the actual condition of our knowledge of this branch of natural history, and of the best means of advancing it—"how to observe in meteorology." We shall then better know our ignorance, and learn to avoid the gross absurdities of prediction—to assign the simple facts of the flight of birds, when assisted by favouring currents of wind, to their true cause, the everlasting search for food; and the accidental profusion of Hips and Haws, and other comeatables, to the immediate and obvious effects of well-ripened wood, and a good blooming time. I will do the gardeners of my acquaintance, and many of the farmers too, the justice to say, that the affectation we are speaking of is not very prevalent amongst them; they act, for the most part, on the spur of the occasion, and are watchful of immediate indications of change: they know that "there shall be seed-time and harvest," and they learn to "trust in God;" and, in a better sense than the maxim was once used in, "keep their powder dry." "Don't talk to me of the moons, and of the signs of the weather," says a shrewd old farmer of my acquaintance; "what you call a sign of rain one day, I will prove to you, by the event, is a sign of fine weather another;" adding, what from its complexion I suspect not to be an original joke,—"I am only twelve hours behind the Almanac-maker; he tells you in the morning what I can tell you, perhaps, more accurately at night."—*P. P.*

Home Correspondence.

ERRATUM.—In last week's No., p. 637, col. b, article "Dog Rose," for "χαγχρος" read "χαιχινος," from χαιχρος (rough).

Horticultural Society of London.—In the *Chronicle* of last week there is a letter from an exhibitor of fruit respecting the prizes offered by this Society for next year. It appears that so long as fruit-growers are quiet, no additional rewards will be offered, while the plant-growers obtain all they ask. Although, at the last June Exhibition, there was only one large collection of stove and greenhouse plants shown, and one in the class of fifteen, which was not thought worthy of the Gold Medal offered, in the class of six there was not a competitor, thus leaving in the classes of stove and greenhouse plants eight medals not awarded. In the classes of Heaths, two of the first prizes were withheld. Notwithstanding all this, considerable additional rewards are offered for next year. The Editor of the *Gardeners' Chronicle*, in 1842, told fruit-growers, in order to induce them to exhibit, that the prizes offered for fruit were equal to those offered for plants. There has been a great alteration on the one side since that period; take, for example, Orchidaceæ, the prizes offered for collections of which, at each Show in that year, amounted to 10*l.*; for collections of fruit, 18*l.* 15*s.* The prizes offered for collections of the former in 1845, at each Show, amounts to 70*l.* 15*s.*; while the fruit remains without alteration, although the fruit tent created intense interest—I think I am justified in saying, even more than those of plants. As far as I saw, there was not a plant of any merit, which had been properly entered, unrewarded, while the fruit-table literally groaned under the weight of meritorious productions, which could not obtain a prize at all. It is well known that one house will produce a collection of Orchidaceæ for each of the Exhibitions, while the fruit-grower must at least have three houses from which to obtain one collection, each of which requires as much skill and attention as the one house of the former. I think—and I imagine that most of my brother gardeners will agree with me—that the additional prizes have been placed where they were least wanted; I have no doubt the reason why fruit-growers do not complain is, that comparatively speaking few of them attend personally, and therefore cannot judge of what is going on. Prizes are offered for the best named plants, while the threat of disqualification is held out to fruit-growers in case their productions are not properly named. In conclusion I may add, that as the Society profess to encourage good gardening only, it is absurd to allow fruiterers to exhibit: there can be no merit in showing other people's productions. Here again the plant-shower is to be protected by a new regulation.—*M. Henderson, Coleorton Gardens.*

[Our correspondent forgets the difference between the expense of bringing a box of fruit and half-a-dozen van-loads of plants. If he compares the cost of carriage with the value of medals to be gained, he will find the balance very much in favour of the fruit-growers.]

Polmaise Heating.—I sent two bunches of Black Hamburgh Grapes to the Horticultural Show in Edinburgh, on the 20th instant, grown in the hothouse at Polmaise, which is heated by means of a circulation of hot air, without either pipes or flues; each bunch weighed upwards of five pounds, and obtained the prize against eight competitors. The Grapes were much admired, both for size and flavour; thereby clearly proving that the system I had adopted was completely successful, and will, I have no doubt, be adopted in future in preference to the old system of flues and pipes—being cheaper and easier managed, requiring less fuel, and incurring no risk of injury to the fruit when blossoming, either from cold air or steaming, when flues are watered in too heated a state. Several of the bunches now on the Vines are about the same size as those sent to the Show.—*Wm. Murray.*

The Polmaise Heating.—I have heard of many strange things in my lifetime; such as a person setting up a man of straw that he might have the pleasure of knocking it down, and of Don Quixote attacking a windmill, and of Hudibras comparing himself with Cæsar; but none of these things are equal to the hallucination that appears to exist in the mental region of the craniums of persons of the present day, respecting the Polmaise System of Heating. In the name of wonder, where has Mr. Glendinning got the idea that "dirty smoke-flues," or "any modification of them," are used in the Vinery at Polmaise? Surely not from anything that has appeared in the *Chronicle*; and he may rest satisfied that there are neither hot-water pipes nor any modification of smoke-flues employed in heating that Vinery. If he has any misgivings on the subject, he might step on board one of the London and Leith steamers, and from that to one of the steamers that sail between Granton and Stirling; and when among the beautiful windings of the Forth, he might be landed within a few yards of the Vinery; any remaining wrong notions will then be quickly dispelled. Mr. G. says, "It is no defence of a system to invoke the crest-fallen appearance of some who considered themselves the best Grape-growers in Scotland." Perhaps not; but what would he say of the gardener who thought he did well when he grew Pine-apples with six pips in height, and then, when a method was shown him of increasing them to twelve pips, instead of adopting the plan, condemns it before he understands it, and with a mind case-hardened with prejudice prefers his own, which is only some remains of the olden time? Surely there is more hope of a progressive being, even though he should be crest-fallen for a time, who can appreciate the invention of his neighbour, than the instinctive being who has only one way of doing his work.—*Peter Mackenzie.*

Destroying Wasps' Nests.—In dry seasons, at the place where I was apprenticed, we generally had a great many wasps' nests in the park and immediate neighbourhood. We were paid sixpence by the gardener for the destruction of each nest. At first we followed the old method of taking them with gunpowder; but wishing to make as much money by them as possible, we discarded gunpowder altogether, and pursued the following plan, which never failed:—Our armoury consisted in a pair of old double-actioned fumigating bellows, fitted with the box and tube; a basket containing some old dry bast-mat, or brown paper; and a small bag with a portion of sulphur; together with a spare basket for the combs, and a spade, lantern, and candle. Thus equipped, when darkness approached we besieged the enemy in the camp. We took off the box from the bellows, and put in the bottom of it a little dry bast-mat, or brown paper, on which we dredged a small quantity of sulphur; we then filled and dredged as before, until we thought we had sufficient material for destroying one nest; we then lighted it with the candle, fitted on the box, and proceeded cautiously to work, the person having the light pointing out the hole, to which we applied the tube of the bellows, and puffed away, taking care not to allow the two sentries to escape that were stationed at the entrance. From the exclusion of the air and the effects of the sulphur, in about three minutes the work of destruction was effected; the combs were then dug out, the suffocated wasps swept back into the hole, which was well trod in the bottom, and then filled up again; after which a wasp was rarely seen again near the place. In about ten minutes we could destroy the strongest nest; so that by this cheap and simple method three young men might destroy an incredible number of nests in one evening after it was dark.—*James Roberts, Hampsthwaite, near Harrowgate.*——*Quercus* says—"Wherever the nest is in a cavity without any other hole or fissure, but the one of ingress and egress, about a wine-glassful of spirits of turpentine will effectually settle them. Pour so much in and stop the hole. Where the ground is such as to crack with drought, connected with a drain, or by any means having other openings or air-conductors to the nest, the spirits are rendered ineffective, and the squib of powder and brimstone must then be resorted to."——*Mr. Wighton* adds, "I have lately tried, with success, destroying wasps' nests with spirits of turpentine. In the evening I pour about a common wine-glassful of the spirit into the holes from a long-necked bottle, and close them immediately with a 'bit of turf, beating it firm with the heel.' I dig out the nests on the following morning. With regard to the quantity of spirit required, much depends on how the nests are situated; if in loose dry soil, and their entrances ascend, or if they are horizontal, more is required. In such cases a small squirt, as suggested by Professor Henslow, must be of great use. It must, however, be the smell that is the cause of death; for if the entrance is not closed immediately after the turpentine is poured in, many of the inmates will survive, especially if the nest is situated as already noticed. But though the spirit causes death, and at times even in the larvæ, still those in the pupa state, being defended by their cocoons, may dig their way out; consequently the nests ought to be dug out and destroyed, for the brood reared in autumn are drones and queens, males and females, to insure a future race. There need be little fear of an attack from such of the wasps as are shut out, and which remain about the closed entrance, for they soon lose their courage, and are easily smashed with a spade. I once gave some wasps' nests a dose during the day, and left the entrances open for a while; I found all was silent within, and few or none would enter; in short, many of them dropped down when within range of the holes. I turned out the nests and the paralysed wasps, without being attacked; my only defence was having previously rubbed my hands and face with turpentine. I may observe that there seems to be truth in Mr. Knight's remarks, viz.:—'That if a nest of wasps is approached without alarming the inhabitants, and all communication suddenly cut off between those out of the nest and those within it, no provocation will induce the former to defend it and themselves. But if one escapes from within, it comes with a very different temper.'"——I cannot understand how "H. P." has failed in destroying his wasps' nest with the turpentine-bottle; I have destroyed more than seventy nests by it since I read of the method. The way in which it was used was to rince each bottle (at the time of using) with spirits of turpentine, and insert the neck of the bottle into the mouth of the nest, covering round the hole with any kind of earth. In two or three days afterwards I have proved them to be all dead. Last week one of my men brought me a nest, the combs of which, I am sure, would fill a bushel, and not one wasp or young one alive in it.—*J. H.*

The Thrip.—The following is a simple and effectual mode of destroying this troublesome pest:—I fill the house, pit, or frame, that contains the plants infested, with steam and Tobacco smoke. By this means I give the plants, pots, and stands, and every part of the house a regular dressing of Tobacco water, which completely destroys these insects, and does not in the least injure the plants, not even the most delicate of them. My mode of using it is this:—For a house 43 feet long and 11 feet wide, I take 1 lb. of Tobacco, and having an old wire basket, containing a few hot cinders, I put the Tobacco on them and hang the basket up in the house; I then blow it with bellows until it is well lighted, when I turn on the steam from a small apparatus that I have for the purpose of steaming the plants. The Tobacco will keep burning until it is all consumed. The steam is kept on for about an hour, in which time the plants are covered with dew, which is well mixed with Tobacco smoke. This I repeat on the following day, using only half a pound of Tobacco; and since then I have not seen one thrip in the house. Those who have not got the means of steaming the house from a boiler, will find a trough, with small holes pierced in the bottom, fixed over the hot-water pipes or flues, a very good substitute. Enough of steam will be generated in this way in one hour to cause a fine dew on the plants; if the house or frame can be covered during the operation, so much the better, as it will prevent the steam from condensing on the glass, and also keep the Tobacco smoke from escaping through the laps in the roof.—*R. G.*

Onions.—Does not "W. E." make some mistake in the statement, p. 621, respecting the crop of Onions grown by Mr. Everitt? It would be most desirable to be informed of the method by which so very unusual a crop, after the rate of 1410 bushels of 80 lbs. each, or 504¼ tons per acre was produced; 2 lbs. 9 4/10 ozs. per square foot could only be the result of some very superior management. Perhaps "W. E." will oblige the readers of the *Chronicle* with particulars.—*Lusor.*—— Another writer, signing himself "C. W.," states that he is an amateur grower of Onions, and has carried the cultivation of them to great success. The largest of his Onions, English sorts, have this year weighed 14 oz. each. After being dried and trimmed, they were sown in the third week in March. He would be obliged if "W. E." would give the size and weight of the 12 largest, and also the ordinary size of the Onions, the number which fill a bushel heaped up, and such other particulars as he may be pleased to afford.

Hybridising Fuchsias.—Our hopes of improvement in Fuchsias lie in mingling the species that now exist: one flower has one desirable quality, another has another—we wish both these to meet in one. This can be obtained by hybridising, or fertilising the seed-vessel of one flower with the pollen of another. To do this regularly and systematically I proceed thus:—I get a small box about 2 inches deep and a foot square, and I divide it into 24 compartments; into each of these I cut a small quantity of worsted thread into pieces about 2 inches long each. The worsted of each compartment is of a different colour, and each colour I use to represent a Fuchsia; for instance, white represents Venus Victrix; orange, fulgens; blue, Formosa elegans; black, Exoniensis; and so forth. Having my worsted ready, I take my box into the greenhouse, and proceed thus with my operation:—I choose a Fuchsia for a female to bear the seed. I examine the plant till I find a perfect flower, newly opened, before the anthers have burst and discharged any of their pollen. I carefully cut off the anthers, and I then select the plant by which it is to be fertilised. I find on it a flower which has its anthers covered with pollen; I pull this, and with it I dust the stigma of the prepared flower, around whose flower-stalk I tie a piece of worsted of the colour that designates the male employed. When I gather the seed, I know by the colour of the worsted at once how it has been fertilised, and I place the seed-vessels in paper boxes to dry, carefully marking on each the names of the male and female parents. In spring I sow the seeds in separate pots, with labels stating particulars; and by this means I hope clearly to ascertain the true result of my experiments, which never could be done if I were to sow my hybridised seed at random. In such case I might obtain a beautiful specimen—I might get excellence of foliage or habit, or size of flower, but here I stop: I could learn nothing further from my success; I could obtain no insight into the means by which I had already succeeded, or was likely to succeed hereafter. In my experiments I have certain objects in view: I want, for instance, to unite the colours of Venus Victrix with the size of Exoniensis. I wish to have Eppsii with a deep-blue corolla, and fulgens with a pale pink or white tube. I cross these with varieties having the qualities I desire; for instance, I cross Venus Victrix with Exoniensis, Eppsii, and Toddiana. Each plant is used alternately as male and female. My object is to retain the colour of Venus Victrix, but to increase the size of the flower. I do not expect to succeed in one year. I find, perhaps, in one plant the tendencies I wish; I pursue my advantage, hybridise this again, and have no doubt of ultimate success. All my experiments I carefully note down in a register, for I have no doubt I shall meet with results I by no means expect; and by knowing how they came, I shall be able to use them to advantage.—*Cavanensis.*

Parrots.—With regard to the management of these, allow me to state how one (an Amazon), which I have had for several years is treated. His food is hemp-seed in one tin, water in another, and nothing else. As soon as the cold weather of spring is over his cage-door is set open, and he lives in the garden and plantation attached to my house in perfect liberty, returning to his cage for food whenever he likes; he helps himself to Gooseberries in their season, and sometimes treats himself to some Apples. He is always in perfect health, and thoroughly enjoys his existence; and adds much to the interest of the garden, by the display of his bright plumage when on the wing; and by his chattering from the trees or house-top.—*P.*—— *T. O'Reilly* adds—"I have known the plumage of the lemon-crested cockatoo restored by cutting a nick in the lower beak. In this case the bird had so feathered himself, that he looked like a young hawk, being covered with scarcely anything but down. A large orange-crested cockatoo acquired a habit of biting its breast, making a frightful sore. I consulted various persons, and accordingly tried Epsom salts and Cayenne pepper-pods, but without effect. I then had a breast-plate made for it, which it was continually trying to pull off. I did not like to have the end of its beak cut off; and at last it became so ill that I had it killed. I attributed this disease to the fact of the servants having given it eggs, butter, and meat. I have now an orange-crested cockatoo, a gray parrot, and a parroquet; they all live on soaked bread with hempseed mixed with it, and have latterly been eating fruit occasionally. They do not have water given to them, but the cockatoo is occasionally indulged with some tea. This mode of treatment seems to suit them."

The Deadly Night-shade.—A few days ago two females from Lancaster were observed in the neighbourhood of Hest Bank gathering and eating the fruit of this plant. This induced two men passing at the time to eat also; one of the men by chance took a few along with him to an inn, and showed them to the landlord, who pronounced them to be poisonous, and recommended a dose of medicine to be immediately taken, which had the desired effect of removing the deadly poison from his body. The other man was not seen until the following day; he was in a state of insensibility, with his eyes closed, and his body was swollen to an extraordinary size; every means were used to save him but without effect, and after lingering three days death terminated his sufferings. The two females, on their return on the same day to Lancaster, were taken alarmingly ill, and a surgeon was instantly called in, who being made acquainted with the fact of their having eaten the berries, immediately applied the usual remedies. For some time there appeared no hopes of recovery; they were in great pain and were quite delirious, and continued so for several hours; but, happily, they both recovered. The Deadly Night-shade is one of the most dangerous of vegetable productions; the berry is, from its fine colour, inviting, and the apparent richness of its juicy pulp, resembling wholesome and more grateful fruit, induces those ignorant of its deadly qualities to taste. It cloys not until the fatal principle is imbibed; its deleterious action is not experienced for many hours; afterwards the victim is overwhelmed with dryness in the mouth, burning pain in the throat and stomach, giddiness, stupor, and is soon unable to account for the calamity which has befallen him. It is to be hoped that this will be a caution to persons gathering and eating wild fruit from the hedge-rows.—*M. Saul.*

Fecundity of the Canary.—There is a person living near Cowley Hall, in the parish of Hillingdon, that has a pair of canaries which have had no less than six nests between the 2d of April and the 4th of this month (September), hatching sixteen canaries, two nightingales, and one green-finch, making in all the large number of nineteen. The whole, with the exception of the nightingales, which by some accident got smothered in the nest, have turned out strong, healthy, birds. The total number of eggs laid by this pair during the season was twenty-four.—*W. M., Hillingdon.*

Societies.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Sept. 20th—This was the Anniversary Dinner, and as it had been arranged to make the first public exhibition of the bust of Dr. Neill on this occasion, previous to its being placed in the Society's Hall, a numerous and most respectable company assembled. The chair was occupied by Professor Dunbar, who, after having opened the meeting in the usual manner, said—"As Dr. Duncan was the parent and founder of the Society, so does it owe much of its success and prosperity to the exertions and talents of our excellent Secretary, Dr. Neill. The duties of the Secretary are not confined to the mere routine business of the Society. Dr. Neill has had external duties to discharge of a most important kind, and these he has performed to the satisfaction of all parties. He has ever been ready to aid with his advice the efforts of industry and merit, while on the other hand he has soothed disappointed expectations by inspiring the hope of better success on a future occasion. As secretary he has had to conduct a most extensive correspondence with the horticulturists of other countries. He has thus made our Society known in every quarter of the globe, and contributed greatly to bring it to its present prosperous condition. Laborious as these duties and exertions have been for a long series of years, Dr. Neill has most ably and zealously discharged them without fee or reward, though trenching on time most valuable to him in his private affairs; he has done his work *con amore.* Practical gardeners and amateurs owe a debt of gratitude to him for his excellent book on horticulture, which is now one of the standard works on the branch of science of which it treats. I need not say how much the respect we owe the Doctor has been enhanced by his amiable character and unobtrusive manners. He is equally valued as a friend, and respected as a man. In consideration of his valuable services to this Society, several members have desired to have a bust of the Doctor, with the view of its being placed in the hall at the gardens, as a permanent memorial of their gratitude to him." The learned gentleman, after making some observations on the bust, then proposed the health of Dr. Neill, who, much affected, rose and said—"Mr. Chairman, I thank you sincerely for the kind and too flattering way in which you have expressed your opinion of me. I say most truly that I would most willingly have escaped from my present position. I feel totally unable to utter what I feel, I am so overpowered with gratitude. It is little more than a year since I had the honour to receive, in presence of a large number of friends, a splendid piece of plate, the gift of 500 gardeners. To see again assembled so numerous a company for the purpose of bringing forward this bust is perfectly overwhelming, and leaves me almost without words. The chairman rightly observed that I had been secretary for many years, but instead of meriting the testimonials I have received, I have been vastly overpaid in the pleasure I derived from holding the situation. I am deeply grateful for this testimony of respect, which was proposed by Lord Murray, Mr. P. Graham, and other gentlemen." Some further remarks were offered by Dr. Neill, who concluded amid great applause; and after some other business the meeting closed.

COUNTRY SHOWS.

Devon and Cornwall Horticultural Society, Sept. 12.—This was the Autumnal Exhibition: the weather was in every respect favonrable, but the attendance was not numerous. The Dahlias were exceedingly good, and attracted much attention. The fruit and vegetables were also very fine, but not so abundant as on former years. FRUIT.—*Pine Apple*: 1, highest flavoured and best grown Queen, 1*l.* 10*s.*, R. Robertson, Esq.; 2, do., 1*l.*, Mr. J. Griffin, gr. to Mrs. Wells. *Melons*, 1, highest flavoured, Green-fleshed, 10*s.*, W. Radcliffe, Esq.; 2, do., 7*s.* 6*d.*, W. P. H. Carew, Esq.; 3, do., 5*s.*, Mr. J. Taylor. *Cherries*: the best dish of Morello, 5*s.*, Mr. J. Taylor. PLANTS.—The best *Specimen Plant* in flower, not having before obtained a prize (Echites splendens), 10*s.*, Mr. J. Griffin. Amongst *Stove Plants* from Mr. Rendle's nursery, we noticed some well-grown specimens of Achimenes pedunculata, Gesnera zebrina, Franciscea Hopeana, Russelia juncea, Vinca oculata, Rivina humilis, Amaryllis Braziliensis, Gardenia radicans, Pentas carnea, Euphorbia splendens, &c. Among *Fuchsias* were Exoniensis, Defiance, Kentish Bride, Kentish Hero, Prince of Wales, Conservative, Gigantea, Neptune, Florence, Nobilissima, Duke of Wellington, Formosa elegans, Venus Victrix, Pawley's Queen, Paragon, Champion, Magnet, Coronet, Eppsii, Robusta, Britannia, Toddiana, Transparens, Tricolor, Fulgens, Princeps, Vesta, Invincible, &c. Besides these, Mr. Rendle also exhibited some seedlings. From the same collection were the following *Dahlias*, viz.—Standard of Perfection, Duranta, Emma Noke, Lady Antrobus, Lady St. Maur, Orange Superb, Sir J. S. Richardson, Royal Sovereign, Grand Monarch, Sir R. Sale, Cook's Confidence, Prince of Wales, Great Western, Antagonist, Hero of Stonehenge, Admiral Stopford, Thompson's Vivid, Queen of Trumps, Beauty of Sussex, Essex Triumph, King of Lilacs, Prince of Waterloo, Swindon Rival, Orange Superb, Oakley Surprise, Mountjoy's Virgil, Princess Royal, Mrs. Shelly, and Rouge et Noir. Of *Verbenas* he exhibited Atro-sanguinea, Beauty, Boule de Feu, Zeuxis, Fanny Elsler, Blue Queen, Striata coccinea, Prince of Wales, and some seedlings.—*Devonport Telegraph.*

Edale Horticultural Society, Sept. 21.—This was the fifth Exhibition during this year, for Dahlias, Carnations, Pansies, Kidney Beans, Celery, Savoys, Broccoli, Red Cabbage, Carrots, Onions, and the best dishes of Apples, Pears, and Plums. The specimens shown were very creditable to the exhibitors, especially when we consider the geographical situation of the place. It is not to be expected but that an elevation of 600 feet above the level of the sea will have a deteriorating influence on the successful cultivation both of flowers and vegetables. The following prizes were awarded:—*Dahlias*: Mr. G. Taylor. *Carnations, Picotees*, and *Pansies*: Rev. G. H. M'Gill. *Kidney Beans*: 1, Rev. G. H. M'Gill; 2, Mr. Wigley; 3, Mr. Bardsley. *Celery*: 1, Rev. G. H. M'Gill; 2, D. Christie, Esq. *Broccoli*: 1, Mr. T. Carrington; 2, Rev. G. H. M'Gill; 3, D. Christie, Esq. *Red Cabbages*: 1, Mr. Wigley; 2, Mr. Cooper. *Carrots*: 1, D. Christie, Esq.; 2, Mr. Eyre; 3. Mr. Bardsley. *Onions*: 1, Mr G. Eyre; 2, Mr. Wigley; 3, Mr. Carrington. *Apples*: 1, Mr. Wigley; 2, Mr. Eyre; 3, Mr. T. Carrington. *Pears*: Mr. Taylor. *Plums*: 1, Mr. Taylor; 2, Mr. Carrington. For Nosegays, three prizes were given: 1, Mrs. J. Christie; 2, Miss Bray; and 3, Miss Taylor.

Sandbach Floral and Horticultural Society, Sept. 6.—This was the Second Meeting for this year. Among plants we noticed some fine specimens of Orchidaceæ, &c., from Crewe Hall; likewise a beautiful specimen of Fuchsia exoniensis, above 7 feet high, and covered with flowers from the top to the graceful branches hanging round the pot, from the garden of Miss Twemlow. The following is a list of the Prizes awarded:—*Stove Plants*: 1, Miss Twemlow, for Achimenes grandiflora, A. longiflora, and Gloxinia maxima; 2, Mr. T. Stringer, for Vinca alba, V. rosea, and Thunbergia aurantiaca. *Greenhouse Plants*: 1, J. Skerrat, Esq., for Pimelea hispida, Crowea saligna, and Myoporum album; 2, Mr. T. Stringer, for Petunia Enchantress, and some others. *Roses in Pots*: 1, Miss Twemlow, for Mrs. Bosanquet, Devoniensis, and Fulgens; 2, Mr. W. Allcock, for Napoleon, Miss Glegg, and Bourbon Queen. *Erica*: J. Skerratt, Esq., for Lamberti, cubica, and Cliffortiana. *Pelargoniums*: 1, Mr. C. Taylor, for Joan of Arc, Comte de Paris, Archduke, Nymph, Clarissa, and Princess Royal; 2, Mr. S. Allcock, for Flash, Nymph, Sultan, Selina, Lord Mayor, and Wizard. *Do.* 3: 1, Miss Twemlow, for Lady Sheppard, Queen of Fairies, and Prince Albert: 2, Miss Twemlow, for Gaines's King, Coronation, and Witch. *Calceolarias*: 1, Miss Tremlow, for Coronation, a Seedling, and Speciosissima; 2, Mr. S. Allcock, for Modesty, and 2 Seedlings. *Fuchsias*: 1, Miss Twemlow, for Exoniensis, Brockmanii, and Majestica; 2, Mr. C. Taylor, for Exoniensis, Defiance, and Lanei. *Miscellaneous*: Mr. W. Allcock, for Lilium lancifolium album. *Coxcomb*: Mr. G. Bayley. Besides the above there were numerous Prizes awarded for Flowers, Fruits, and Vegetables, the growth of cottagers, whose productions are much improved since this Society has existed. The Prize for the best managed cottager's garden was awarded to Mr. T. Steele.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

CALANTHE MASUCA. Lilac Calanthe. (*Stove Epiphyte.*)—Orchidaceæ. Gynandria Monandria.—This charming plant flowered with Messrs. Rollisson, of Tooting, in June 1843. It is a native of Nepal, and may be regarded as the gayest of the terrestrial species of that rich country, being conspicuous both for the large size of their flowers and their rich colour. From the other purple species allied to it, this is readily known by the leaves as well as by the flowers. C. versicolor has leaves smooth on both sides; C. purpurea downy on both sides, especially beneath, while this has down only on the under side. C. versicolor has white sepals and petals; C. purpurea and this, purple ones. While, however, C. purpurea agrees in the colour of its flowers, its lip is altogether different, being very narrow, with the lateral lobes quite round. C. masuca shou'd be potted in turfy heath mould, mixed with a few pieces of potsherds. In summer it should receive an ample supply of water at its roots; and where it can be avoided, little should be allowed to fall on its leaves, otherwise the young shoots will damp off. It enjoys a humid atmosphere and a high temperature; but as the leaves are very delicate, they will soon become scorched if shading is not carefully attended to. In winter little water will be required; still, it is necessary to keep the soil damp enough to preserve the bulbs from shrivelling. This is one of the most difficult of Orchidaceous plants to grow well.—*Botanical Register.*

GASTROLOBIUM SPINOSUM. Spinous-leaved Gastrolobium. (*Evergreen Shrub.*) Leguminosæ. Decandria Monogynia.—Of all the plants of this tribe that we are acquainted with, few admit of being more easily reduced to handsome proportions, or have a habit and foliage so neat and unique as this. With a degree of strength and robustness unusual amongst the leguminous plants now abounding in such plentiful variety in our greenhouses, it combines broad and conspicuous leaves, so markedly different in their outline to every other of the same class within the sphere of our knowledge, that whilst they attract notice by their novelty, neatness, and amplitude, they at the same time furnish a distinction so prominently perceptible, that the most cursory observer can never be at a loss to distinguish the plant from those that most nearly resemble it. Till the development of flowers in the spring of the present year afforded the chance of referring it with certainty to its proper station, it was cultivated and generally known as Chorozema oppositifolia, a mistake which most probably arose from the analogy displayed in its general features to those of the stronger-growing and larger-foliaged species of that genus. However this may be, there can now no longer be a doubt of its incorrectness, and the consequent necessity of abrogating it. Seeds were imported from the Swan River Colony and distributed by Capt. Mangles a few years since, and Mr. Young, of the Epsom Nursery, was fortunate enough to raise a number of specimens which have since been multiplied by cuttings, and distributed amongst the principal metropolitan establishments. The original

plant flowered profusely with Mr. Young for the first time last March. Although flowers have never been disclosed before the present year, the prodigality of their production, in every case we have witnessed, justify us in considering it as a free flowering and highly ornamental species. At Ealing Park, Mr. Robertson had a number of small plants just raised from cuttings, completely laden with blossoms. These had been kept in a warm house; and we have no doubt that the flowering, and indeed the health and vigorous growth of most New Holland plants, will always be vastly improved by the application of a little additional warmth in the early spring months when the shoots are tender. The name of the genus is a combination of two Greek words, *gaster*, the belly, and *lobos*, a pod, alluding to the distension of the legume. The marginal spines of the leaf have suggested the specific term.—*Paxton's Magazine of Botany.*

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—The Orchidaceous-house here is undergoing repair, and at the same time considerable alteration. In addition to the hot-water pipes, which run round the house under the front and back shelves, by which it has hitherto been warmed, the bed under the plants in the centre is about to be heated by hot water in open iron tanks, constructed by Burbidge and Healy. This is to be effected by means of a flow and return, inclosed in a hollow chamber covered in with slates, on which the plants are to be placed. These tanks are to be set on brick supports, about two feet from the bottom of the chamber, which is 3½ feet deep, and are to be heated by one of Burbidge and Healy's new boilers. The hot water will be conducted from the boiler to the tanks by means of one-inch pipes passing under the pathway into the bed. In order that the house may be steamed occasionally, small openings will be made in the sides of the chamber and furnished with sliding lids, to be opened or shut as required. All the rain which falls upon the roof will be collected in a large slate cistern, placed at one end of the bed which occupies the centre of the house. It measures 5 feet 9 inches in length, 3½ feet in width, and the same in depth. The curvilinear stove was gay with the several species of Achimenes, among which was the new one, A. picta, which, independently of its beautiful blossoms, is richly clothed with a finely variegated foliage, which the other sorts do not possess. In this house was also in flower the yellow variety of Gloriosa superba, an old and well-known plant, but one which is seldom seen in bloom; Lælia superbiens is growing here on a large block in great luxuriance, and is again throwing up several flower-stems. The specimen of Aristolochia gigas trained along the roof has produced its singularly large concave blossoms in great abundance through the whole summer months, and is still in fine bloom. It does not succeed well when grown in a pot; but, when planted out in the border of a stove, it thrives and flowers profusely with little care, speedily spreading over a large space. In the house, which was formerly a Pine-stove, but which has lately been much altered, the plants are looking well, the Orchidaceæ, on charred blocks, indicating by the healthy green of their foliage that they like the situation. On the front shelf was a plant of Clerodendron fallax, producing a head of flowers of brilliant scarlet. The plants in the large conservatory are looking well; it is in spring, however, that this house presents the gayest appearance, when the Acacias and other leguminous plants are in bloom. The front shelves are at present decorated with several of the new varieties of Fuchsia, which were displaying an abundance of showy blossoms. Trained up the south side of the house was a plant of Centrosema splendens in flower—an exceedingly handsome scarlet climber: it is better known in gardens under the name of Kennedya splendens. The sweet-scented Mandevilla suaveolens was also twining here in "Nature's careless grace," and expanding numerous clusters of snow-white blossoms. Along with these was Bignonia jasminoides, which is one of our prettiest autumn-flowering climbers; and in the same collection, turned out into the bed, was a large specimen of Cestrum aurantiacum, producing fine panicles of showy orange flowers. This valuable addition to the conservatory was contributed by Mr. Skinner, who sent it from Guatemala, a year or two ago; and, finally, a specimen of Hedychium Gardnerianum, planted out in the bed, was also bearing a spike of rich yellow flowers with prominent scarlet stamens. The late warm summer has brought many of the autumn Pears into use earlier than usual, and a large quantity of fine fruit is already in the fruit-room. The samples of Beurré Diel, both from the wall and from dwarfs, are exceedingly handsome. Those from standards are not so large, owing to the late dry summer. Specimens of Beurré Rance from the wall are unusually large and fine. We measured one which was 6 inches in length without the stalk, and fully 10½ inches in circumference. The floor of the fruit-room, which was made of concrete in the first instance, although it perfectly answered the purpose as regards dryness, had become very uneven. It has now been overlaid with Portland cement mixed with three or four parts of sharp sand. This has been done a week; and the cement was becoming exceedingly hard on the surface, and of the colour of Portland stone, although it sets much slower than the other cements.

Royal Botanic Garden, Kew, Sept. 25.—The two Fourcroyas, mentioned previously, p. 540, are now in blossom—at least that part of them which is within the stove. Several feet of the panicle, which have been allowed a passage through the roof, are still only in bud. There is only 13 inches difference in the height of the two (and they have not yet done growing); the tallest is 35 ft. 6 in. from the ground to the top of the panicle.

Miscellaneous.

China.—Advices have reached the Horticultural Society from Mr. Fortune, dated May 10. He was at that time residing in a Chinese temple, called Tein Tung, in the Ningpo district, in the midst of the Green Tea cultivation. Hundreds of Chinese were busy gathering the leaves of the shrub, which covers the sides of the hills. This part of the country has proved by far the richest place for plants and scenery which Mr. Fortune had yet visited, many of the plants which had been previously only seen in gardens, being there wild in the woods and hedges. He had succeeded in reaching Shanghae, in the Moutan season, and found hundreds of gardens there filled with this beautiful flower. Some capital Azaleas had also fallen in his way.

Destruction of the Gooseberry Caterpillar by Salt.—To destroy the green worm, as also the small orange-coloured aphides, which often injure the bushes and destroy the fruit, we sprinkle the plants with salt and water early in the spring, before the leaves are developed; the mixture may then be made so strong as to whiten the branches, without affecting the future crop. Should the leaves or buds be in part expanded, the brine should be greatly reduced, say one quart of salt to about eight gallons of soft water, applied over the bushes from the rose of a watering-pot.—*Hovey's Magazine of Horticulture.*

Monstrous Grape.—There has been lately produced at Stover, in Devonshire, one of the seats of the Duke of Somerset, a berry of a Black Hamburgh Grape, which measured 5 inches in circumference. It was much flattened, and even depressed, at the stalk and opposite end, and, being furrowed, presented somewhat the appearance of a Tomato. It contained 10 seeds apparently perfect.

New Variety of Grapes.—M. Lenoir, a recent French writer on Vines says, that "a seedling Vine raised by M. Van Mons, at Brussels, produces fruit as large as a Green-gage Plum, which, at the latest, ripens in the first fortnight of August, and never fails. Its qualities are no less remarkable, as it is both solid and sweet."—*Journal of Science and Art*, vol. xxvii. p. 229.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

It may be useful for many to know that one of the finest winter stove plants, Gesnera zebrina, has yielded to a greenhouse treatment all the year round. It was allowed, for want of better convenience, to start of its own accord, which it did early in summer. The cold this time last year put a stop to its growth, and it lived in the greenhouse through last winter along with Pelargoniums, Fuchsias, &c., without any injury to its foliage; it began to grow again in spring, and flowered for a long time last summer. As this plant is a general favourite in drawing-rooms, &c., for which its tubers and succulent foliage make a provision for hard usage, a few of them might be thus treated in every place where such plants are in demand; and not only so, but the experiment opens a field which may extend farther than many of us are aware of. There is no variation in the treatment of the stove worth noticing this week.

Conservatory.—The general treatment of this house also will be uniform for some time to come. There are two varieties of Bignonia jasminoides in cultivation, one of which is a very shy bloomer and ought to be discarded; the other is the finest of our hardy greenhouse climbers—a peerless beauty as Deronian calls it. Cuttings of the latter, struck any time before the end of October—and they root as free as willows—will blossom all through next summer in very small pots. At the risk of being thought tiresome I shall once more notice the lovely Mandevilla suaveolens: it has been in flower here all this autumn against a wall in the open air, and looks more healthy than plants of it in-doors; this climber is one of the best to train as a specimen over a wire trellis; and as it requires to be pruned closely every year, after flowering, it may be kept in a dry shed along with Fuchsias, Myrtles, &c., through the winter, and either forced in spring, or allowed to break of its own accord in May; long shoots of it, two or three years old, will root as freely as a Grape Vine, without tongueing, and thus a large specimen may be got from an old plant in one season. If the shoots will allow put two or three coils in the pot, as Mr. Mearns would do with a Vine shoot, and you will have more roots to sustain the specimen.

Pits, Frames, &c.—It is now time to put young Gardenias, Neriums, and Orange trees into their winter quarters. A cold pit, from which the frost can be excluded, is the best place for them: as they are always kept in the smallest pots into which their roots can be got, and force best when thus under-potted, it often happens that their roots perish during winter; to prevent this, it is a good plan to turn them out of the pots now, and plunge the balls in a thin layer of light earth during their rest; but as Gardenias will flourish in peat only, they should be plunged in it. Besides these, there are scores of half-hardy delicate plants, which will keep better in the same way through the winter than in pots, as their roots are thus in a uniform state; and if damp appears at any time, a little dry compost scattered over the surface will prevent it. A slight hotbed of half-spent dung is a good place to begin to force China and Perpetual Roses about the beginning of October; the lights may be left off all day at first, unless it rains.—*D.B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

Those who have tender greenhouse shrubs, such as Heaths, Leschenaultias, &c., planted out in beds, must now begin to think of getting them housed for the winter. It is surprising how fast plants grow when planted out, but it requires great care and attention in their management after they are taken up, or they are very liable to damp off during the dark months of winter. Some plants of Leschenaultia planted out in June last, at which time they were very small, are now strong plants which will require number 12 sized pots when they are taken up. In removing them, the ball of earth must be so much reduced in size as to admit of an inch or two of turfy soil being placed all round it when potted. This is essentially necessary, and a secret upon which their future success in a great measure depends; for the plants being provided with fresh and healthy soil to work into, they sustain little or no check after the removal. After they are potted, place them in a close frame on a north aspect; sprinkle the plants lightly every morning, and keep the frame close during the middle of the day, but they may have plenty of air during the night. When they have recovered the check, place them in a sunny situation, to harden the tissue of the plant, but do not permit them to flag, or the foliage will become brown and rushy.

Bulbs.—Many of the early kinds of Tulips and Narcissus are now beginning to grow; and therefore, to keep them out of the ground any longer will injure them. As, however, it is impossible to plant them permanently until the autumn plants are removed from the beds, it will be found a good plan to place them upon an inch or two of finely-sifted leaf-mould and sand, and to cover them several inches deep with old tan or leaf-mould. In this situation they will make root, and may be removed to their proper situations with the soil adhering to their roots as soon as the beds are ready for their reception. The same observations apply to all kinds of bulbs or tuberous-rooted plants that are desired for early spring decoration, as, for instance, Anemones, Crocuses, Snowdrops, Hyacinths, Jonquils, Crown Imperials, &c. &c.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Continue, every favourable opportunity, to pot off Carnation layers: let the grass or leaves be dry, for when wet with either rain or dew, the soil, which will sometimes get in the axils of the leaves however carefully they may be handled is difficult to be removed, and if not, will prove detrimental to the plant during winter. The layers must be put in a close frame for a few days till they have again struck root. *Tulips.*—Seedling bulbs when very small are best in the ground, and small offsets of choice sorts had also better be planted. *Auriculas.*—Any offsets which may not have been ready earlier in the season must now be removed, planting carefully round the side of a quart pot; water to settle the soil to the roots, and place in a situation free from drip or heavy rain. *Pansies.*—Continue to make the beds for next year's blooming, and propagate by slips all that it is desirable to increase. *Polyanthuses.*—Seedlings may still be pricked out to get established before winter. Compost heaps should be turned, and all insects carefully picked; a small quantity of quick-lime will prove beneficial to the decayed turf intended for Tulips.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—Ripening fruit should be kept in a dry, warm atmosphere, to give it flavour. The swelling fruit should have a warm, moist atmosphere; when water is required it should be given more sparingly, since evaporation goes on much slower at this season, and the soil, receiving more water than the plant can take up, becomes soured, causing the fruit to ripen without flavour. It is proper after this season to let crowns and suckers, after being trimmed, lay upon the kerb of one of the pits to dry, for a day or two before planting. Endeavour to keep the linings where in use dry, as rain causes the heat to decline suddenly, and consequently causes much labour in turning and renewing.

Vinery.—The Grapes for winter use demand constant attention, to prevent their being injured by damp. As early in the morning as convenient, let a slight fire be made; and as soon as it begins to tell upon the thermometer, open the top ventilators, to let the damp pass off. Towards evening the heat in the flues or pipes will have declined, and the house may be closed, to keep out the damp night air. If the Grapes are covered with paper bags, the bags should be removed occasionally, to examine the berries, as, if one berry begins to decay, it will soon infect the whole bunch, if not removed. Where means have not been taken to protect the outside borders from wet, no time should now be lost, particularly with the borders of those houses intended to be forced. Dry Fern is an excellent material for keeping borders dry and warm. It must be laid on thickly, in layers, beginning at the front of the border. The whole should be covered with a thin layer of good straw, and fastened down with ropes and pins, as a thatcher would fasten the thatch of his stacks.

Peach house.—If the directions already given for the early house have been followed, nothing more will be required than to keep the trees as cool as possible. The second house will soon be ready to be put in the same state of order as the first, and from the time that all preparations are completed in these houses, they may be made exceedingly useful for keeping plants of various kinds in, till the forcing commences. Care should, however, be taken not to bring into them any plant that is not perfectly free from insects.

Figs.—The trees that are still bearing should have slight waterings, to assist them to perfect their fruit; but trees having no fruit likely to come to perfection, and whose leaves are fading, should be kept dry and cool, to induce a state of early rest. Plants in pots should not be kept growing longer, or they will not be in a fit state for forcing early.

Melons.—Give scarcely any water after this. Continue to maintain a warm, dry atmosphere, to give flavour to the fruit.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Cucumbers.—To prolong the season of fine crisp Cucumbers the plants must be kept clean and healthy by giving them plenty of top and bottom heat. This can be easily effected in frames, if the bed has been perforated with pipes; but the disadvantage of frames, when contrasted with good close pits, is, that in the one case great care must be taken to prevent any rank steam from the dung entering from the lining, while in the other there can be no danger in using the fermenting material as fresh as you can get it. The chief difficulty is the securing abundance of it. If that can be obtained, and you have some nice strong plants in pots, a fresh bed might now be made, to produce in the earlier months of winter; but without abundance of fermenting material it would be folly to attempt it. Those who grow them in hot-water pits will now have their winter plants in good order. *Manure.*—Take every opportunity of converting all refuse vegetable substances, clearings of roads, cleanings of sheds, &c., into rich dressing for the garden, by watering with the liquid that distils from Melon-grounds, dung-hills, &c. I have tried a number of the new manures upon a small scale, and though useful as auxiliaries, I find that there is nothing preferable to old hot-bed dung, and the decomposing heap of those substances that can be collected in a garden, for the production of good, medium-sized, high-flavoured vegetables. Weak solutions of guano, superphosphate of lime, &c., frequently repeated, were found very serviceable to strong growing plants in pots, Cucumbers in boxes, &c., but the same apparent benefit was not the consequence of their application to crops in the open garden: though it is right to state that Cauliflower was considerably improved, especially by guano, and that Celery was rendered of a deeper green colour by the application of nitrate of soda; but, in size and flavour was not anything superior to that grown in the usual manner. However concentrated the strength of these new manures, it must be evident that whatever their chemical influence, they can affect the mechanical texture of the soil but little, and hence, so far as rendering loose soils more retentive, and stiff soils more open, the old (now attempted to be discarded) system of manuring must ever maintain a great superiority. It is true, a similar mechanical effect might be produced by a proper application of lime, chalk, marl, or in extreme cases, of clay or sand; but these operations cost both trouble and expense. It is a pleasant thing for a gardener to get rid of all his dung-pits and rubbishy-looking linings, but he will act wisely if he makes the most of an old assistant before he is well supplied with a new one, as, however anxious he may be to follow in the wake of new improvements, he may find that when he has rendered himself deficient in muck, there may be no striking desire manifested for spending good gold on guano, &c., nor yet in furnishing him with the means of producing early vegetables without the assistance of fermenting matter. *Routine.*—Tie up Lettuces and Endive, earth up Celery, and gather fruit in fine weather. Encourage the ripening of the wood of Peach-trees, &c., by exposure and shortening the shoots. Remove everything offensive in the way of decaying Bean-stalks, Pea-haulm, run Lettuces and Endive, and weeds, wherever they appear. Give everything a fresh and neat appearance, by frequently stirring the soil, and by sweeping and rolling the walks.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Now is the time to fix upon what trees should be taken out, and what sorts should be planted to improve the scenery and enhance the value of Old Woods.

Coppice.—Attend to the directions given in last week's Calendar. Prepare ground for planting, and fill up vacant spaces; taking care to select the most profitable kinds of trees, shrubs, &c. for the purpose.

Young Plantations.—Where new ones are about to be made, I would strongly recommend planting a sufficient number and variety of plants for permanent undergrowth, at the first planting, where shelter or blinds are desirable, as they will have a better chance to establish themselves than when planted at a future time; take care, however, to head them off at different heights, in order to keep them low and bushy, and to prevent them from injuring the permanent trees; this method is equal to thinning in their first stages of growth. The beneficial effects of it may be seen in Dr. Thackeray's plantations at Nerquis, where some Beeches have been headed off, and Spruce Firs broken off. In addition to the kinds specified in last Calendar as suitable for this purpose, I would plant plenty of Hollies, some Yews, and various other choice evergreen and deciduous shrubs, especially near the sides of rides and walks.

Hedge-rows, &c.—Refer to late Calendars.—*W. B.*

VII.—COTTAGERS' GARDENS.

As we may expect cold weather soon, any plants turned out into the border that are worth preserving, and that are likely to be injured by frost, had better be lifted and potted without delay. As soon as scarlet Pelargoniums become unsightly they may be taken up, the soil shaken from their roots, the stems shortened back a little, and then put into small pots, in which they can remain through the winter. Place them in a dry situation, cool, but secure from frost, and give them little or no water. I have known them to be successfully preserved over winter hung up by the roots in a dry cellar. Plants in pots in the window should be sparingly watered, and after this time it should be given in the morning. This autumn has been very favourable for all gardening operations. Advantage should be taken of fine weather like the present for digging up the Potatoes where they are ready for lifting. After they are raised let all weeds, haulm, &c., be cleared away to the manure heap, for upon its accumulations the crops for next year greatly depend. Lettuces sown in August will now be in good condition for transplanting. This should be done in rows about nine inches apart, and let the plants stand about six inches apart in the row; they like a rich, light, and, for winter, rather dry soil; the situation should be a warm border if possible. When these, and late Cauliflower plants are put in, little more will be needed in the planting way for some time. Keep a few Endive plants blanched, by inverting a flower-pot over them, closing up the hole in the bottom of the pot, in order to prevent wet and light from entering. Continue to gather fruit as it becomes ripe, taking particular care to prevent its being bruised or injured in any way; the slightest bruise upon the fruit, even although not visible on the outside at the time, will ultimately occasion premature decay. Grapes ripening on walls should be protected, if frosty nights are likely to occur.—*J. McH.*

State of the Weather near London for the week ending Sept. 26, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

To Correspondents.—*Lover of Accuracy.*—We have never received either of the inquiries to which you refer. Rely upon it no question is ever unanswered more than a week, and this only happens when inquiries do not reach us before Friday, or require a great deal of consideration.

Apple-tree.—*A Lady.*—Your trees, 6 yrs. old when transplanted two years ago into poor soil, and which are now weak and moss-grown, will be improved by a good dressing of farm-yard manure dug in before spring. The trees should be moderately pruned back as soon as the leaves have fallen; and if they are occasionally powdered over with lime, or washed with lime-water, it will tend to prevent the growth of Moss.‖

Asparagus.—*E. G. L.*—Potter's Guano may be applied at the rate of half-a-pound per square yard to Asparagus-beds. It should be well diluted in water, and applied in portions weekly during the early part of summer, commencing immediately the cutting is over. Salt, at the rate of 1 lb. per square yard, may be applied at once in spring. Other manures may be employed along with it.|

Bees.—*A Young Apiarian.*—Your bees might survive the winter by feeding, but for the want of brood-bread, an essential thing seldom thought of, they must be weak as the spring advances; therefore the best way is to unite them to those in the common hive thus:—In the evening fumigate both parties; take the queen from the weakest hive and destroy her; mix the bees, and let them ascend into the straw-hive, impressing them next day to cement their friendship.—*J. Wighton.*

Books.—*H.*—Mackintosh's "Practical Gardener," Roberts "On the Vine," Mills "On the Cucumber," Lindley's "Theory of Horticulture," Knight's "Physiological Papers."‡

Carnations.—*W. O.*—Your scarlet bizarre more resembles Twitchett's Don John than any variety with which we are acquainted.*

Exportations.—*J. C.*—If you pack your cuttings very tightly in a box of sphagnum, and nail them down so that they cannot be opened, they will travel pretty well. The best way, however, is to plant them in Ward's cases, if you do not regard the expense and can find a good conveyance.——*G. L. C. F.*—We presume the best way to take Apples and Pears to India—by the overland route, of course—would be in a box of dry sand. We can hardly anticipate the possibility of sending them round by sea. We have indeed seen such fruits arrive from China in tin cases, and still green; but they were quite spoiled, and worthless.

Flower-Gardens.—*A. W. G. B.*—We fear that there is no possibility of making a garden gay in autumn, without pot-culture; for where is a substitute to be found for scarlet and other Pelargoniums, Verbenas, Petunias, &c.? If you rely upon Annuals you will be disappointed; if upon herbaceous plants, few are handsome enough for the purpose. Possibly some of your beds may be filled with the following:—Campanula grandis, Coreopsis lanceolata, Double Pinks, Delphinium grandiflorum (double), Statice tatarica, S. gmelini, and Pseudo-Armeria, Double Poppy Anemone, Potentilla Russeliana, Œnothera speciosa and macrocarpa, Heartsease, Gladiolus psittacinus, Double Rockets, Lathyrus grandiflorus, Double Scarlet Lychnis, Rudbeckia serotina and hirta, Phlox Brownii and procumbens, Monarda didyma, Stenactis speciosa, Aquilegia glandulosa, and Gentianas of sorts.¶

Heating.—*A. M.*—A small boiler, troughs, and some 3-inch pipe will enable you to heat your pit better than with dung.——*A. B.*—You may keep frost out of such a house as you describe by means of a *good* Arnott stove placed in the middle; it should be a third-size above the small ones, and furnished with a hopper. But it would be far better to heat it with hot water. We never give you prices—for that you must consult the dealers. If you use an Arnott stove you must recollect that it requires *very careful management.*——*A Subscriber.*—Do not employ steam for heating. It is very expensive and inconvenient. If you do, you will be glad to pull your apparatus down again. Why not adapt hot-water pipes to your still; or rather, why not sell your copper still, and lay the money out in heating the house with hot water.——*Amateur.*—You may certainly grow plants in the manner you propose; but you must have some means of shutting off the hot water when you do not want it, or you will have too much in summer. Three inch pipes will do very well. Melons may be grown in such a place, provided you can warm the soil a little without drying it.

Hollyhocks.—*D. O.*—The Hollyhock is little more than a biennial, and frequently dies suddenly, if sown too early in the first season, or if allowed to remain long in the seed-bed before transplanting; therefore the best way to keep them in health is not to sow them before June, and, when large enough, to transplant them singly where they are to remain and flower in the following season; afterwards cut them down as soon as they have done flowering, and remove them to a fresh situation, where the ground has been well manured, before winter. By continuing this treatment you may keep the same variety for years ¶

Insects.—Our correspondents inquiring about insects will oblige us by addressing their letters hereafter to John Curtis, Esq., Olive-cottage, Hayes, near Uxbridge, Middlesex.——*Cotton Blight.*—You will find an article upon the cotton or American blight, at page 116, of the *Chronicle* for this year. *R.*——*A Lady Subscriber.*—The gardener is right; the wasps are females, and will live through the winter. *R.*——*North Esk.*—The insects transmitted with the Melon-leaf are a species of thrips, and we are unable to suggest any remedy at present beyond those already published. *R.*

Larches.—*A. B.*—There are two very dwarf kinds of Larch, one a variety of the common Larch (Larix europea), which seldom grows more than two or three feet in height; the other is Larix leptolepis, a Japan species, of about the same stature.¶

Lawns.—*A Subscriber.*—If your Grass is quite killed, you had better procure some fresh cow-dung and strong loam mixed in equal proportions, and put a good covering of it over the old turf (without moving it), and relay it with fresh turf; it should have been well watered two or three times during the very dry weather; this would have prevented it from being killed, and is much the cheapest way in the end.¶

Manures.—*J. N. C.*—The mud from your water-course must be very strong. We should water it with a solution of sulphate of iron to destroy the smell. It might then be applied advantageously to your borders, which, if they are light and sandy, would be much benefited by it. In order to ascertain whether it is too strong, sow a little Mustard-seed on a small quantity of it. If the plants come up quickly, and are of a deep green colour, it is fit for anything, and need not be feared.——*Southton.*—Sea-kale will be benefited by being dressed with salt like Asparagus. It should be applied just when the plants begin to grow in spring.‡

Names of Fruits.—*Worcester.*—6, Flat Nonpareil; 10, King of the Pippins; 17, Sops of Wine; 26, Ribston Pippin, 27, Minchall Crab; 30, Ribston Pippin. Pears: 11, Seckle; 12, Ambrosia; 18, Glout Morceau; 19, appears to be Williams's Bon Chrétien; 20, Passe Colmar.‖——*J. P. M.*—The disputed Pear is the Brown Beurré.‖——*H. M. H.*—Your Apples ascertained in their present immature state are,—No. 3, Lamb Abbey Pearmain; 5, Keswick Codlin; 9, Blenheim Pippin; 10, Yorkshire Greening; 13, Court of Wick.‖——*W. B. H.*—No. 1, Blenheim Pippin; 2, Nonsuch; 3, Norfolk Beaufin; 4, Chaumontel; 5, Seckel.|——*Phœbe.*—Supreme Crab.|——*J. H. L.*—2, Blenheim Pippin; 3, Kerry Pippin; 4, Hollandbury; 7, Keswick Codlin; 8, Northern Greening; 9, Margil.|——*Worcester.*—6, Flat Nonpareil; 12, King of the Pippins; 11, Seckle.|

Names of Plants.—*Hortus Siccus.*—No. 1, Coronopus didyma; 2, Peltaria alliacea; 3, Helosciadum inundatum; 4, Spergula nodosa; 5, Bartsia Odontites; 6, Ranunculus aquatiles, 7, Ranunculus hederaceus. §——*H. C.*—Tussilago nutans, now called Leria nutans, is neither a Portuguese plant nor a succulent, but a native of Mexico. It has no English name. It is a purple-flowered plant of no beauty—not worth growing for ornament.——*Z. Long.*—Elæagnus hortensis.——*L.*—Your Fern seems to be a seedling of Asplenium rhizophorum.——*A. C.*—A Cuscuta, probably brought in with the soil.——*A Regular Subscriber.*—The productions which you have forwarded on the roots of a species of Zichya are not, as you suppose, Fungi, but of the same nature as the bodies which are so common on the roots of leguminous plants. The nature of these bodies is not at present well understood, but M. Desmazières has prepared a Memoir on the subject, illustrated by beautiful drawings, the publication of which has unfortunately been delayed from an attack of the eyes, which has prevented the completion of his observations. These bodies are produced very shortly after the germination of the seeds; and if the gradual development be traced, as it has been by ourselves, it will be found that they arise from the cellular tissue, though generally having one or more branches from the vascular bundles at their base. The contents of the cells at a certain stage of growth become blue from iodine. At a later stage, the cells are filled with short straight, or forked bodies, first observed by M. Desmazières. In your Zichya, the excrescences are very large; but, as far as can be judged from dry specimens, they are of the same nature. It is not known what the function of these bodies is, but it is probable that, in very dry weather, they may be reservoirs of nutriment. The contents of the bodies soon become pulpy, and the bodies themselves eventually burst. Your plant has perished probably from some other cause; and, if we may judge from the disgusting smell of the specimen, the cause of death has been the application of too strong manure. *M. J. B.*

Peaches.—*B. O. D.*—In this dry season, Peaches have been apt to drop prematurely, especially late sorts. The late Admirable has not attained the perfection it usually does in moist summers. That which you have for the Noblesse is perhaps the late Admirable.

Pelargonium.—*Ireland.*—A list of the best Pelargoniums for forcing appeared in last year's vol., p. 25.*

Pine-apples.—*A Subscriber.*—All we know of Mr. Mills's pits has been stated. One plant grew under the middle of each light. Upon looking again at the account of his operations, given at p. 619, we find that the pits are said to be *three* feet wide; this is, of course, a misprint, and should be *five* feet. A common 3 light box measures about 11 feet by 5.

Planting.—*J. M. T.*—Transplant your evergreens in the very beginning of November; they like moderately light loamy soil, and require no manure. If you grow them too fast they will not ripen their wood, and then the winter will kill them back.——*S. N.*—Fell Yews early in the winter. If your Roses are tender, as many of the Bourbons and Tea-scented kinds are, you had better not plant them out before spring. All the varieties of R. sempervirens are tolerably hardy, we are unacquainted with the Triomphe de Bollwyller. Verbascum pœniceum is quite hardy.

Strawberries.—*Delta.*—Runners do no good to the parents from which they spring, but the contrary, and are better stopped. Never cut off leaves from Strawberry-beds after fruiting, it is a very bad practice. People reason—no, not reason, but say—that as they have good crops in spite of cutting off the leaves, the operation must be a good one. They do not inquire how much better the crop would have been if they had left the leaves alone. We should think that Pears would grow very well against your walls, if they are hardy sorts, such as the Beurré Rance, Passe Colmar, Easter Beurré, Marie Louise, Napoleon, Glout Morceau, Diel, &c. Why not try the experiment with one tree first? If they will grow one year they will 20. The great baking Pear called Uvedale's St. Germain, would be almost sure to succeed, and so would Monsieur le Curé. What is a horse-shoe espalier? Cold, damp walls will do no harm to Apples and Pears, but they certainly will injure Plums and such tender trees.

Tobacco.—*W. T. B.*—It is unlawful to plant Tobacco except in any physic garden of either University, or in any other private garden, for physic or chirurgery only; and in those places the quantity so planted must not exceed half a pole. Heavy penalties are also incurred by manufacturing Tobacco without attending to the Excise Regulations on the subject.—*W.*

Transformations.—*A. W.*—We are far from saying that Potentillas will not change into Strawberries. The only difference between them is, that one has a dry and the other a succulent receptacle. In fact, what Linnæus called Fragaria sterilis is now called Potentilla fragaria. What you have sent is P. nepalensis. We hope we are not doing wrong in giving the public the benefit, now and then, of your clever letters.——*A. M. S.*—It is not impossible that a warted Gourd should produce something like a Vegetable Marrow; but it is rather improbable. We should fear there has been some mistake. We could find no Rose-leaves in the letter.

Vines.—*S. S.*—The fruit being cut, it will be proper to give all possible air, with moderate heat, but gradually diminishing the latter till the leaves drop. The Vines may then be pruned and turned out. Provided the wood is sufficiently matured they will not suffer from cold, and may remain out till February, if you only commence forcing in March.‖

Miscellaneous.—*G.'s* note is sent to Mr. Paxton.——*Mickleswell.*—Let your Iris chinensis remain as it is. Brachystelma is an ugly plant, allied to Stapelia. Keep it dry and warm in the winter. Gladiolus fragrans is very sweet, and violet-coloured. Ixia maculata has dark spots at the base of the petals. It is evident that your Cape bulbs are wrong named.——*An Old Subscriber.*—We never heard of an objection to a purchaser picking such bulbs as he prefers. If any "old gentleman" refuses to allow it, his customers should go to the next shop.——*William.*—Your house is so very narrow, that slight rafters will do; and we think 5 by 3 inches quite strong enough. By all means hinge your front lights if you wish it. Sliding sashes are, however, most convenient, and least liable to get out of order.——*Z.* is answered in the "Calendar of Operations" for this week. ‡——*H.*—Bougainvillea spectabilis is a charming thing, with heads of Lilac flowers resembling Hops. It is now in flower in the great Conservatory at Chatsworth; but we never saw it in that state before, it being apparently difficult to flower. Any nurseryman may procure it of his London correspondents, if he will give himself a little trouble in inquiring. It may be struck from cuttings without difficulty. If you plant it out give it plenty of light and warmth in the summer, and keep it cool in winter.——*C. C.* must give his name and address. We cannot insert statements of facts without their being confidentially authenticated by the writer's name and address.——*T. O. R.*—It is said that Indigo is a cure for wasps' stings ‡——*W. H. F. C.*—The cause of your Mignionette withering in small patches and dying down, probably arises from damp at the root, keeping the plants thin and open will possibly remedy the evil.‡——*H. H.*—The dry season is no doubt the cause of your Raspberries not having made young wood this year. You had better cut out the old wood at the usual time.‡——*W. C.*—Ipomœa ficifolia is not one of the best conservatory climbers, but it is a very handsome species. We do not expect that Stephanotus floribundus will succeed in a house where the temperature is only 50° ‡—*N. T. B.*—You may commence to force your Vines about the end of November, but you must take care that the outside border is kept warm in winter.‡——*Octavia.*—A cellar is a good place to store up Carrots and Beet-root, if it is dry. It is yet rather early to introduce plants into heat for winter flowering. If you watch our Weekly Calendar of Operations you will obtain full information on all such points.‡

SEEDLING FLOWERS.

Dahlias.—*M. J.*—Neither of your seedlings are equal to similar sorts in cultivation. No. 1 is too small and undecided in colour; in No. 2 the centre opens irregularly, and the flower wants depth.*——*Sunbeam.*—Nothing was left but the centre of your flower when it reached us; from the quantity of loose petals in the box, we imagine it to be rather flat, and the centre shows too many flat, pointed, and unbloomed petals.*——*D. D.*—Your seedling is decidedly worth cultivating; the tip is fine, and distinct in colour; the petals in the centre are rather too upright.*

Fuchsias.—*J. L. V.*—Your seedling with a light tube and sepals tinged with green, having a pale rosy-purple corolla, with deep-green foliage, is the largest flower of the light class we have seen; but the colours appear to be rather too faint.*——*C. B.*—There is nothing remarkable in your seedling; the peculiarity you point out is not a desirable one.*——*W. J. E.*—Your seedling, having a very light tube and sepals, with green terminations, and the crimson corolla having a purple tinge, is a distinct and handsome flower, of a medium size.*——*T. F.*—The lighter seedling of the two sent is not worth keeping; the other variety is large, bright, and rich in colour, and though somewhat like others in cultivation, is equal to any of its class.*——*Y. and Co.*—Your seedling named Alicia is a plant of handsome growth, and the flowers, which are produced in great abundance, agree with the following description:—Tube and sepals delicate flesh-colour, the latter having green points; corolla stout, of a deep blood-colour; flowers of a medium size.*

Petunias.—*T. J.*—It should be stated with regard to this flower, whether the plants have been grown in pots, subjected to greenhouse cultivation, or grown in the open border, from the extreme delicacy of your specimens the former appears to have been their mode of growth; they differ from all others we have seen in their extreme delicacy of texture, and the fineness of the pencilling in and around the throat. No. 4, named Elegans, combines fine form with great neatness; 2 and 5 are very pretty, having Violet pencillings on a white ground; 1 is large and wants flatness, it is also too much indented on the outline; 6 is not uncommon.*——*R. S. G.*—Your pencilled seedling No. 1 is a very pretty flower of good form, and firm in texture. No 2 is rather small, brilliant in colour, but not improved by being mottled; that quality wants decision.*

Thunbergias.—*Joseph Fryer.*—We do not perceive any difference in your blooms from those of T. aurantiaca and alata. With regard to the plants not being subject to red spider, we doubt the fact, judging from the specimens which we have received.§

GUANO for SALE, in Bags of 1 cwt. each, just landed, with a succession of cargoes to arrive.—Successive years' experience has unquestionably proved that Genuine Guano is the simplest, cheapest, and best Manure within the reach of the Agriculturist. The only reasonable anxiety which now remains is to procure the Guano unadulterated, and to obtain such practical directions for using the Manure as shall fully develop its productive powers. To secure to buyers these indispensable requisites, with each purchase will be given a warranted chemical analysis of quality, and also a copy of the recently-published Pamphlet, "Practical Instructions for using Guano as a Manure, illustrated by Practical Results."

Large parcels will be delivered direct from the ship or waterside premises; smaller quantities may be had at the warehouses, 24 and 25, Billiter-street, or delivered within any reasonable distance at a trifling additional cost. Apply to JAMES CLARK, 24, Billiter-street.

WHEAT-SOWING.

FREDERICK BRAIN begs to call the attention of the Agricultural world to his GUANO MANURE, prepared expressly for Wheat crops: it abounds in all the ingredients that are necessary for a good grain crop. He particularly solicits persons who found the Foreign Guano a failure last season to give his a trial, it being much more powerful, and free from adulteration, so justly complained of in the Foreign by Agriculturists, as well as by all the leading Agricultural Journals.

Testimonial to Brain's Guano Manure.—"5 A, Hawley Road, Kentish Town, London, Aug. 15, 1844.—This is to certify that we have subjected Brain's Guano to a most patient and rigorous analysis, and find it contains all the necessary constituents of a good manure, and is well calculated to give fertility to a soil which is either naturally barren, or has been exhausted by over-cropping, by supplying the land with those substances which are absolutely requisite to a healthy vegetation: (it is not adulterated, and can always be depended on, being of uniform composition.)—(Signed) JOHN MITCHELL and FREDERICK FIELD, Analytical Chemists, of the Royal Polytechnic Institution, London."

Also, BRAIN'S highly-concentrated LIQUID GUANO, for Grass Lands, Gardens, Shrubberies, Hothouses, and Conservatories, price 1*s.* 9*d.* per quart bottle, with full directions for use, (enough for 80 gallons of Liquid Manure), to be had of most respectable Florists, Seedsmen, and Chemists in town and country.

Works, Thomas-st., Duke-st., Stamford-st., Blackfriars-road.

THURSDAY, Oct. 10—Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

Sept. 30—Chepstow. | Oct. 5—Collumpton.
Oct. 2—Harleston. | Oct. 8—Abergavenny.
Oct. 9—Monmouth.

WE have read with an interest, which has doubtless been shared by the great majority of our subscribers, the accounts of the agricultural improvements effected by Mr. Mechi, the spirited proprietor of Tiptree Farm, and we heartily hope they may fully answer the expectations of their liberal and enlightened promoter*. Some THEORETICAL VIEWS ON DRAINAGE are proposed by Mr. Mechi in our Number for August 17, avowedly for the purpose of inviting discussion; and therefore we have no scruple in submitting our doubts as to the correctness of some of them. The point particularly alluded to is the statement at p. 562, in the middle column. Mr. Mechi's proposition is as follows:—"The surface of the drains should nearly equal the surface to be drained; so that if the surface to be drained were nine square feet, the sides and top of the drain should present an area of nine superficial feet."

This proposition appears to be stated in much too general a manner, for we do not perceive that any necessary connection can exist between the area to be drained, and the dimensions of the drain by which such area shall be effectually freed from the stagnation of surface-water; on the contrary, it appears to be very evident that the proper extent of porous surface, as well as of the internal dimensions of a drain, necessary to dry a certain space of ground, must vary according to the climate of the locality for which the drain is intended, and not according to the area to be drained. To render this more evident, we have extracted from the Meteorological Journals, published monthly in the "Annals of Natural History," the following Table, showing the monthly quantities of rain which fell in 1843 at Chiswick and Orkney respectively. The Table is as follows:—

Months.	Rain at Chiswick.	Rain at Orkney.
	inches.	inches.
January	4.47	3.88
February	0.76	4.44
March	1.38	6.25
April	2.35	1.32
May	0.47	2.46
June	1.62	4.05
July	5.26	2.31
August	1.62	1 04
September	1.67	2.92
October	3.28	1.84
November	0.98	2.
December	4.19	6.38
Total in the year	28.05	38.89

From this it will be seen that the total quantity of rain last year was one fourth more at Orkney than at Chiswick; and by Dr. Dalton's Tables, compiled from the Transactions of the Royal Society and other sources, we find that the annual mean quantities of rain in different parts of the country vary from 67 inches, amongst the mountains of Cumberland, to 20 inches, in Essex; the mean of all England and Wales being 31 inches. No uniform rule as to the area of porosity or the internal dimensions of drains can therefore be given, without reference to the locality and climate for which the drains are to be calculated.

* We by no means wish to be understood as approving in all their details the measures which Mr. Mechi has lately taken at Tiptree; but that does not hinder us from honouring his patriotism, and heartily wishing him success in what, at considerable risk of private loss, it has induced him to undertake.

The next objectionable proposition of Mr. Mechi is the assumption that the superfluous surface-water should run off through the drains within the same space of time in which it fell from the clouds. Now if we attend to the actual state of things, as it occurs in nature, we shall find that though water falls during rain, in equal quantities over the whole surface of a field, yet, as the drains by which it is to be carried off are placed at certain intervals in the field, the water must run into them unequally, some part of it having to filter through a greater distance in order to reach the drains than the rest. Whatever, therefore, be the area of porosity of the drains, the water cannot escape as rapidly as it fell. And further, it appears pretty certain that it is not even desirable that water should escape so rapidly, even if means could be found to enable it to do so. The gentle percolation of rain-water through the soil, accompanied by air and other gases, is probably highly beneficial to vegetation. It therefore appears that the conditions of perfect drainage are sufficiently fulfilled, if the area of the drains be such that all superfluous surface-water is in a constant state of motion towards the drains till it is ultimately carried off by them.

If we now proceed to offer a very rough approximation to the size of drains necessary to secure the condition of perfect drainage above described, we shall probably find that the dimensions of Mr. Mechi's drains, instead of being too small, are unnecessarily large, and that great waste of capital has been hitherto incurred in draining land, from the drains having been made much more capacious than necessary. We do not allude at present to the large deductions for evaporation and for the consumption of the plants growing on the surface of the land, to be made from the amount of rain which falls in any locality before it reaches the drains.

But assuming for a moment all the water which falls upon a given surface of ground in any locality to be carried off by drains, let us inquire what the size of the drains must be in order readily and surely to effect this at all seasons. Referring to the same meteorological journals as before, the following is a Table of the greatest amount of rain which fell in any day, and in any three days in each month of last year at Chiswick and Orkney respectively:—

Months.	Chiswick. Inches and decimals of rain on each of 3 most rainy days.			Chiswick. Total of 3 most rainy days.	Orkney. Inches and decimals of rain on each of 3 most rainy days.			Orkney. Total of 3 most rainy days.
Jan.	0.87	0·67	0 37	1·91	0·29	0·10	0·81	1·20
Feb.	0.32	0·20	0·09	0·61	0·59	0·57	0 36	1·52
March	0·29	0·12	1·16	0·57	0·92	0·71	0·51	2 14
April	0·26	0·28	0·26	0 80	0 29	0·26	0 35	0·90
May	0·21	0·08	0·06	0·35	0·49	0·37	0·40	1·26
June	0·22	0·23	0·35	0·80	0·41	0·41	0·47	1·29
July	1·26	0·53	0·57	2·36	1·12	0·55	0·27	1·94
August	0·23	0·64	0 20	0·79	0·57	0·13	0·12	0·82
Sept.	0·24	0·50	0·16	0·90	0·86	0·65	0·45	1·96
October	1·03	0·61	0·95	2·59	0·36	0·25	0·25	0·86
Nov.	0·52	0·20	0·24	0·96	0·29	0·36	0·24	0·89
Dec.	0·88	0·34	0·52	1·47	0·60	0·47	0·53	1·60

N.B. In the above Table the three days' rain were never continuous, but the three most rainy days are picked out of each month promiscuously.

From the above Table it appears that though the whole quantity of rain which fell in 1843 was much greater at Orkney than at Chiswick, yet that on particular days more fell at Chiswick than at Orkney. Probably the soil would be less saturated with rain at Chiswick than at Orkney, so that the extra quantity which occasionally fell would be more rapidly evaporated, and therefore the extent of drains requisite to free a given space from water would still be greater at Orkney. We do not, however, at present take into account the amount of evaporation. It appears that on only two occasions in the last year did the rain which fell at Chiswick in one day ever reach one inch, and only once in that year at Orkney; if, therefore, drains are calculated to allow *one inch* of rain to run off in *three days*, they would have been sufficient last year for either Chiswick or Orkney, without reckoning the amount carried off as vapour by evaporation, or for the supply of vegetation. What area of drains, then, is necessary in order that the land shall be freed from one inch of surface-water in three days? Supposing the drains made at intervals of 18 feet, each would receive the water from a distance of 9 feet on each side of it, each foot of the length of the drain would correspond to 18 square feet of ground, and these covered by one inch in depth of water, would carry exactly one cubic foot and a half for each longitudinal foot of drain. Hence at the end of a drain 300 feet long, (which is the length recommended by Mr. Mechi), there would be 450 cubic feet of water to pass off in three days. This comes to 1 cubic foot of water in 10 minutes, or 172 cubic inches of water to be discharged every minute. But as Mr. Mechi says that a drain should not run above half full, let us estimate the quantity of water to be discharged at double its actual amount, or at 344 cubic inches per minute. Assuming a very small velocity in the water running out of the drain, viz., that of only 30 feet or 360 inches per minute, the area of the end of the drain would not require to be quite one square inch. This sectional area corresponds to that of a circular pipe not quite one inch and a quarter in its internal diameter, which would be all that would be necessary to hold double the quantity of water which, according to the above hypothesis, is ever likely to run through it in the climate of Chiswick. It is evident that the upper parts of the drains might safely be composed of tiles of even less than an inch diameter, so far as their capacity for holding the water likely to run into them is concerned. Thus, the quantity of water which would run through the drains made by Mr. Mechi on Tiptree Farm, if only half full, would be above ten times the quantity likely ever to find its way into them at one time.

But another most important element must be taken into account in determining the real size of drains requisite in any given locality, viz., the large portion of the water falling upon the ground which is converted into vapour, or taken up by plants before it can reach the drains. In the varied circumstances of different fields at different seasons and under different management, perhaps nothing but actual experience can inform us what allowance it is safe to make for this mode of carrying off water in estimating the amount which must be carried by drains from a given surface.

It would, therefore, be very important to have registers carefully kept of the actual discharge of surface-water, together with the velocity of the current, from the main drains of a certain number of acres of land, compared with the fall of rain at the same place and during the same period, measured by the rain-gauge. The depth of the drains below the surface, their length, and number should also be stated. If these particulars were carefully noted, we have little doubt that it would be found that draining has hitherto been made a far more expensive operation than it need be. These remarks, we hope, may turn the attention of our agricultural readers to the formation of a true theory of drains on the most economical principles consistent with perfect efficiency.—*T. T.*

ON THE BEST SPRING CROPS FOR FOOD.

[BY THE REV. R. MORRIS.]

Trifolium incarnatum.—All allusion to the Annual Crimson Clover must not be omitted; of late years it has been sown as a new plant, and was at first highly extolled, its growth being peculiarly rapid in April and May. It does not appear, however, to keep its ground in public estimation. It is thus described by Loudon:—An annual and native of Italy has been recommended by an Italian professor to Sir J. Sinclair, but it is not likely that such a plant, which, even as an annual in our garden borders, has not a fourth of the vigour of the common Clover, should ever be worth culture in this country. This may be rating it much lower than it deserves; yet it is undoubtedly the fact, so far as its cultivation in this neighbourhood is concerned. It has been tried by myself and others on the clay, where it has not succeeded, from the great uncertainty of its growth, at all, and from the meagre quantity it has yielded. Still, as it can be sown on a Wheat stubble without the labour of ploughing, and as it will come in in the month of April, for ewes and lambs, if it should not fail, it may perhaps be prudent to plant some of it this season, on a warm dry soil.

Rye-grass is usually sown with Clover; it is a hardy Grass adapted to most descriptions of soils, and though perhaps of much less value than Clover, as a spring crop, it is earlier, producing (at least at first), food of a better quality than the Clover itself does alone. The expense of seed and cultivation being small, and the uncertainty at all times of getting the Clover to stand, causes its almost universal use, as a Grass seed, to mix with it. "It has been cultivated for a great many years, certainly previous to the year 1677, and it is only lately that any other species has been tried as a substitute for it, in forming artificial pastures. One peck of Rye-grass, with 14 pounds of Clover per acre, is generally considered sufficient for sowing artificial pastures." The sorts most generally preferred are Russell's and Pacey's; but the Italian species is considered far superior to any other. "It is described as peculiarly excellent. It has been sown with Barley without injuring the crop, and by sowing a little thinner, it is found not to choke the Clover in the first crop, whilst its quick growth enables it to keep a-head of it in the second, producing hay little inferior to the first." At a Meeting of the Edinburgh Agricultural Society, it was stated by Professor Traill, that it was proved in the experimental garden of

the Duke of Buccleuch, to arrive at maturity much earlier than any other perennial Rye-grass, and to produce nearly double the quantity. The experiments made upon it indeed show that it is decidedly relished by cattle in pasture, and in hay; having been given to horses, along with that of the common Rye-grass, in separate bundles, it was uniformly preferred. When allowed to ripen, it gives double the produce of common Rye-grass, and the nutritive substance extracted from the herbage, affords more saccharine matter than that of the celebrated sort known as Pacey's." An intelligent and practical agriculturist in this neighbourhood has kindly favoured me with the result of three years' experience in this kind of Rye-grass. "In the first year," he says, "I sowed ½ bushel per acre with 10 lbs. of Cow-grass, and had an excellent plant of both. In the following spring the Rye-grass was earlier and more luxuriant than the Clover. I early stocked the field with sheep and lambs, both of which did extremely well. So fond were they of the Rye-grass, that they disregarded the Clover, and trod it under foot as unpalatable; nor would they touch it so long as the least portion of Rye-grass could be obtained. I never saw a field of the same size carry more stock during the summer, (which was genial); nor could the sheep be desired to thrive faster or to be more healthy. In consequence of the Clover being refused, I sowed 1 bushel of Italian Rye-grass and 4 lbs. of Dutch Clover the second year, which answered equally with the first year's growth, and was altogether satisfactory. I obtained in this year about 40 bushels of seed after having grazed the first crop, and shut up the field the last week in May. It is very difficult to secure the seed without loss, especially if it be allowed to stand to get ripe. I intended, and fully thought I should have been early enough; but I was obliged to thresh it in the field upon large sheets, or a great portion of the seed would have been lost. I mixed the threshed hay of the Rye-grass with Barley-straw and made it into a rick. The cart-horses ate it with great avidity, preferring it to very good hay. In the spring of 1843 I sowed 2 bushels of Italian Rye-grass and 4 lbs. of Dutch Clover per acre, and did not find too much plant. It has carried a fair number of stock, but allowance must be made for the extreme dryness of the season. I have lately carried a field of Wheat grown on very good land, which had been fed and stocked heavily two years with sheep. The straw is short but the ears good. I am inclined to think that the Italian Rye-grass had considerably exhausted the land, or the Wheat would have been heavier. If the next crop of Wheat grown after Rye-grass be light, I shall then be convinced of it. I sowed 2 bushels last spring with Clover-seed amongst Barley—the former is a good plant, the latter a failure; I have, therefore, little doubt about obtaining a plant in any season." The excellent properties of this kind of Rye-grass I have had confirmed by the testimony of two other very experienced agriculturists of this district, who have quite abandoned the common sort for it. In March the blades were 14 to 16 inches long, with the seed formed. It carried 20 sheep with their lambs to the acre, five weeks; thus affording a healthy and very nutritious food; sheep and lambs thriving well upon it at the most trying season of the year. In respect to the whole of this class of produce, it has been very sagaciously suggested by a near neighbour of mine, that the distinguishing advantage appears to be early maturity; but on the other hand may not the question be asked, Are plants so nearly allied in nature to Wheat equally valuable for ameliorating crops, with those in which a more marked difference appears? When we consider that in no one quality is Red Clover much inferior to any, and in many far more valuable than most others, we need not wonder that it is and has been for a long time grown to a far greater extent than any. It is moderately early in its growth, its produce abundant and nutritious, adapted for soiling, making into hay, or for pasture; and is considered by writers on Agricultural Chemistry, as well as by practical farmers, as the best preparatory crop for Wheat. The species called Cow-grass is rather later in flowering, and appears in most respects (if there be any difference), rather inferior; it is perennial, growing as a natural pasture Grass on some soils, and on that account is sometimes preferred, where land is intended to be left several years for pasture; though in most cases, like the Red Clover, it is lost after the second year. Cattle grazed upon it are not so liable to be blown or hoven as on the other, which may indicate that it is not so succulent, but it renders it safer as a cow-pasture. All things considered, the Clovers are perhaps the most valuable of the green crops that are grown; but alone they are not sufficient to supply the want that is felt in the present system of farming, of green crops frequently alternating with Corn; for if too frequently repeated, their growth is uncertain; the land—to use the common expression—gets sick of it. The produce of Cow-grass is very great, yielding when in flower, per acre, on a rich black loam, 9 or 10 tons, and of nutritive matter, 6 or 7 cwt.; but the long-rooted Clover is greater still, since a rich clayey loam yielded 30 tons, and of nutritive matter upwards of 20 cwt. These Clover-grasses contain the phosphate and sulphate of lime; hence peat, wood-ashes, and gypsum, are said to be excellent dressings for this crop, and have in many cases succeeded in renovating Clover-sick lands. It seems almost superfluous to observe, that the mode of sowing is almost always broadcast, amongst Wheat or Barley, being either harrowed or hoed in. The quantity of seed per acre should be about 14 lbs.; and if sown with Rye-grass, it is perhaps preferable to sow them separately, as the difference in weight of the two seeds is very considerable. On the clays the plant is more certain with a Wheat than a Barley crop.

Winter Tares or Vetches form an invaluable production of spring and summer food for cattle. They are very extensively used as a fallow crop; for if got off early, and the months of July and August are favourable for the operation, a good fallow may be made, without the entire loss of a crop. Yet, as this depends so much on the state of the weather, it cannot be concluded that a complete fallow is unnecessary. For quantity of produce at one cutting, Vetches stand unrivalled, and their quality is not less valuable. If ate young, a good second crop may be grown in some instances; but, as a general practice, it does not appear desirable. An early variety has been introduced within the last few years; and although decidely earlier (say two or three weeks), in flowering it is scarcely equal in produce to the other. The winter Vetch, so called in contradistinction to the spring Vetch, though they are scarcely different in appearance from each other, is usually cultivated by one furrow, on the stubble. It is questionable whether two ploughings would not be better, provided the time after harvest permitted. It is usually sown without dung, and on rich kindly clays the crop will be good without its assistance; but land in poor condition, and naturally light soils, should be manured. When there is time to give only one furrow in autumn, the dung should be applied on the stubble. The winter Vetch may be sown alone, where it stands the winter well, at the rate of 2 to 2½ bushels per acre, but a little Rye amongst it—about 1½ bushel—protects it from frost, serves as a support, and augments the forage crop in spring. It may be sown in August if the Wheat crop will allow of it; but there is the risk of its being so forward as to be cut down by frost in January. It would be well, perhaps, to sow some in August, and again in September, and a third sowing in October, both for security and a succession of spring food. It is preferable to drill rather than broadcast, as there is an opportunity of hoeing the land between them. As the great merit of this crop is its quantity, it will produce disappointment if sown on land in bad condition without manure, as I found to my cost the year before last. It is stated that in 3000 grains of the green herbage of the common Vetch, there consists of—

	Grains.
Woody or indigestible substance . .	557
Water	2250
Nutritive matter	193

No crop better repays the addition of any organic fertilisers. The soil preferred by the Tare is clay, and therefore it is of so much value where Turnips cannot be profitably cultivated. The produce of Tares cut green is, according to Middleton, 10 or 12 tons per acre, which is a large crop; and when made into hay, at about three tons per acre. If sown in August and not cut off by frost, they will be fit for use early in May. If cut green, Professor Thaër observes, they draw no nourishment from the soil whatever; while made into hay, they afford a fodder preferred by cattle to Pea-straw, and more nutritive than hay or any other herbage. Horses, cows, sheep, hogs, all feed and flourish upon them; hogs are soiled upon them in Sussex, without any other food. They are liable to few or no diseases. Sometimes, but not often, they are injured by mildew. There is a sort called or known by the name of the "racers," which are highly spoken of. It is stated of them, that being planted on the 26th of August, in the proportion of 1 bushel of Rye to 2½ bushels of Vetches per acre, the Rye sown on the furrow and the Vetches drilled across, which seeds the land all over beautifully, on a quantity of land of moderate description, in a very exposed country, they had attained their full maturity on the 5th of May, but were fit for feed a fortnight before, surpassing all others in that neighbourhood. This variety is undoubtedly more hardy, and at least 10 or 12 days earlier in the growth and fitness for feed—the early sowing thereby covering the whole surface of the land before winter, the mixture of Rye keeping off the frost and supporting the Vetch, by which means a circulation of air at the bottom no doubt promoted their early growth. From these remarks it will be worthy of consideration whether it would not be advisable, in the present peculiar season, when we have, contrary to all past experience, lost both our hay and Turnip crop, and especially that invaluable friend the Swede, to sow a small portion of Rye as quickly as possible; also some winter Vetches—the "racers" if they can be got—with Rye mixed; and it might be well to try on suitable soils the Trefolium incarnatum; these might be followed next month by further sowings of winter Vetches, so that there might be obtained food for cattle from the middle of March through the spring.

ON THE YOKING OF CATTLE TO PLOUGHS.

In a Leading Article of No. 36 of the *Gazette*, there are some remarks by a correspondent on the mode of harnessing cattle to implements, and in particular to the plough, in which it is stated that the attachment of the draught-chain to the back-band affords a mean of altering the line of draught. From this assertion I beg leave humbly to dissent: it appears to me that such attachment should always be as loose and easy as possible, and merely for the purpose of keeping the chains close to the sides of the working animal. I think that far from having the effect ascribed to it, of "bringing the muscles of the back into play, and increasing the capability of the animal," the tightening and compressing of those muscles by the forcible drawing down of the back-band must have the directly contrary one of inconveniencing and hurting him, and therefore of impeding his motion. Ill-fitting and especially tightness of any part of the harness must, I think, always be productive of uneasiness to a greater or less degree, and consequently of loss of power or force to a proportionate extent. Besides, the bridle, or extremity of the plough, to which the draught-chain is attached, always affords the means of altering the draught as the ploughman wishes, both as to depth or shallowness, and width or narrowness of the furrow-slice. It appears to me, therefore, that the draught-chain should form one straight line from the collar to the plough-beam, and that any angle at the back-band must tend to a loss of power.—*A. J., Roxburghshire.*

[We still think that the use of the back-band in the manner recommended by our correspondent, is a relief to the draught animal. It is true that an incidental advantage of it consists in the means it affords of regulating the depth at which the plough shall work; but this is not the use chiefly insisted on; if it were, "A. J.'s" indication of the arrangement at the bridle of the plough, as being the legitimate means for this purpose, would be conclusive. The use of the back-band in the manner in which it is represented at work in the above figure, which we reprint, obviously tends to divide the strain of the implement between the shoulder and the back. The strain upon the shoulder is not so great when the back-band is thus at work as if the draught-chain were perfectly straight. To be sure, the strain thus imposed upon the back is greater than the differential advantage thus obtained by the shoulder; but not only is the horse, we think, better able to sustain the greater strain thus put on a fresh set of muscles than he would be to sustain the smaller additional strain which would have been sustained by an already overloaded set, but the pressure thus placed on the back makes him, we think, better able to overcome whatever strain may be placed on his shoulder. Does it not give him a firmer footing? One of the chief advantages which the use of the cart possesses over that of the waggon, consists not only in the horse, as it carries part of the load, not having the whole of it to draw, but also in the firmer footing afforded by the weight on the cart-saddle, which would enable him more easily to draw the whole weight, would make him, *à fortiori*, better able to draw that which is thus diminished. As a proof of this we may relate an anecdote, the particulars of which were detailed to us by an eye-witness. A horse in a cart was drawing stones from out of a quarry, the approach to which was a descent. When the cart was loaded, the labour connected with it was found to be beyond his power. In order to remedy the evil, the stones were placed more forward in the cart, thus not only placing more of the load on the back of the horse, and leaving less for him to draw, but firming his footing, and therefore enabling him to put forth greater exertion. But "A. J." may say that the advantage thus afforded the animal lay altogether in the first of these particulars, not in the second. He cannot say so of the next measure that was taken, for it was found that the horse was still unable to extricate the load. The man was ordered to mount him; the advantage which the animal obtained by the additional weight, and consequent firmer footing thus given to him, so much exceeded the disadvantage which we must presume he experienced from having an additional load to carry, that the next effort he put forth was successful. The advantage of any arrangement by back-band or otherwise, by which the strain, whether it be in the draught of cart or plough, may be partly laid upon the back of the draught animal, and only partly on its shoulders, is thus made apparent.]

ON MINERAL AND INORGANIC MANURES.

No. XXVII.

By Professor Charles Sprengel.

(*Continued from page 644.*)

3. *Dutch peat-ashes*, worst quality (yellowish gray) 100,000 parts consist of—

70,400	parts	of silica.
4,134	,,	alumina.
6,131	,,	lime.
3,930	,,	magnesia.
4,096	,,	oxide of iron, and a little protoxide of iron.
0,200	,,	protoxide of manganese.
0,040	,,	potash.
0,420	,,	soda.
3,395	,,	sulphuric acid, combined with lime and potash.
1,246	,,	phosphoric acid, combined with lime and iron.
0,464	,,	chlorine, combined with sodium into common salt.
5,544	,,	carbonic acid, combined with lime and magnesia.
100,000	parts.	

4. *Peat-ashes from Lüneburg*, found to be a good manure (reddish-yellow). 100,000 parts consist of—

31,700	parts of	silica.
5,070	,,	alumina.
31,889	,,	lime partly combined with silica.
0,960	,,	magnesia.
17,728	,,	oxide of iron, and a little protoxide of iron.
0,520	,,	protoxide of manganese.
0,120	,,	potash.
0,072	,,	soda.
6,188	,,	sulphuric acid, combined with lime into gypsum.
1,183	,,	phosphoric acid, combined with lime and iron.
0,084	,,	chlorine.
4,486	,,	carbonic acid, combined with lime.
100,000	parts.	

Of the peat-ashes No. 1, 3000 lbs. are often used on one Magdeburg acre of land; as thereby about 180 lbs. lime, 300 lbs. gypsum, 48 lbs. common salt, 150 lbs. magnesia, and 120 lbs. phosphate of lime, are conveyed to the soil, it may easily be understood why the industrious Belgians value them so much. Gypsum, common salt, and phosphate of lime are the substances by which they act most powerfully. 3000 lbs. of peat-ashes per acre may appear much, but if only 1000 lbs. should be applied, the gypsum only could be expected to act, as the other substances would not be present in sufficient quantity to benefit the soil. If the above quantity be new it will act for 5 or 6 years. Of the Lüneburg peat-ashes still greater quantities are used, viz. 3 or 4 tons per acre, and by such quantities the texture of a clayey soil will be improved.

We may conclude, from the component parts as well of this as all other peat-ashes, that they can decompose but little the humic parts of the soil; they serve the plants mostly as food; and as, in the main, they do not possess much of the easily soluble salts, even a greater proportion than the above stated might be applied per acre without any chance of injuring the crops. It is the small quantity which has been hitherto used of peat-ashes which has led to the opinion that they are worthless as a manure, whilst occasionally a great quantity has not produced any effect, because they contained a salt not easily soluble in water, for instance sulphate of iron; or because they contained much of phosphate of iron, which, if not soluble in water, is so in liquid humic acid, by which the plants were supplied with more iron than they could bear. Peat-ashes, however, which contain sulphate or sulphuret of iron, are, as we shall hereafter see, amongst the most valuable manures, if used in small quantities, and they entirely supply the place of gypsum.

ON THE REGISTRATION OF FACTS TENDING TO ILLUSTRATE QUESTIONS OF SCIENTIFIC INTEREST.

RUST IN WHEAT.

It was good advice which I once heard given by a dealer in objects of natural history to a friend who had offered to procure specimens for him in some foreign country he was about to visit—"If you really wish to serve me," said he, "do not send me pretty specimens, nor yet anything that you may fancy particularly curious. I am already overstocked with such objects. Just keep a jar at hand, filled with spirits of wine, or gin, and whenever you see some very common-looking reptile or insect, pop it into the jar. The chances are, that everything you may consider least worth preserving will be of most service to me." The fact is, that persons who are not naturalists are no judges of what objects are most likely to be of interest in a strictly scientific point of view. Botanists would rather receive one of our most common weeds from a newly-discovered or newly-explored country than a new species of an already known genus. There are higher departments of botany than mere collectors of specimens are aware of. To ascertain the geographical distribution of a well-known species is a point of vastly superior interest to the mere acquisition of a rare specimen. My friend Darwin well understood this (but then he is an accomplished naturalist), when he so often stepped aside from his geological and zoological pursuits, to preserve specimens of plants for me; though botany formed no portion of his immediate studies. I suppose there are few persons possessing a healthy taste for the details of real adventure, who have not by this time read his most interesting "Journal of the Voyage of the Beagle;" and from what they must there have seen of his appetite for observation, they will not be surprised to hear that I have just received from him two blighted ears of Wheat, which few persons would have thought it worth while to carry with them round the world, but which he brought home upon the chance of their affording some information on the cause of those extraordinary and devastating blights to which the crops are occasionally subject in South America. As the memorandum he has made upon the subject will possess an interest in the eyes of agriculturists, I shall here present it to your readers; and then mention the cause to which these blights must be ascribed:—

MR. DARWIN'S MEMORANDUM.

"*Northern Bank of the Plata, Nov.* 20-30, 1833.

"No. 1593.—Bearded Wheat materially injured by a blight, called the 'Polvillo.' When a field is attacked, it seems, even at a distance, burnt up, and of a red appearance. On walking amongst the Corn, the shoes and trowsers become covered with a fine rust-coloured powder: hence the name. The powder is lodged in minute oblong patches, beneath the epidermis, which may at first be seen partially raised, and forming a scale. It attacks all parts indiscriminately. If the leaves are a little infected, the grains of Corn are light and dry; but if the ear and stalk are attacked, the crop is entirely spoilt. The blight is not observed before the grain is pretty full; and its attacks are very rapid—three or four days being sufficient to spoil a whole field. It is endemic in the whole district, though not equally destructive throughout. From this cause, last year, when the weather was wet, no grain was gathered. Hence an immense importation of flour took place from North America. This year, the weather being fine and dry, the blight will destroy or injure the greater part of all the crops. Fields thrown up in Buts, clear of weeds, on high ground, are equally attacked with those of less favoured aspect. It is here attributed to the sun's action after heavy dews. Crops grown from grain of the country, from the Cape of Good Hope, and from Rio Negro in Patagonia, were all more or less affected. It is remarkable that the Wheat at Rio Negro itself (which is grown on low diluvial lands) produced, even last year, its immense crop uninjured. This blight is a prodigious evil to the country, and most mortifying to the agriculturist, who does not know that all his labour will be lost, till within a week or fortnight of the time when he was expecting to reap the fruits of it."

This account of Mr. Darwin's would alone have inclined me to suppose that he was describing an example of a very virulent attack of rust or red-gum, a form of fungus which I have noticed in the Journal of the Royal Agricultural Society, vol. ii. p. 9, and again at p. 220, where I have endeavoured to prove its specific identity with mildew. The two forms of rust with which we are acquainted in England have been termed Uredo rubigo and Uredo linearis; and it should seem that the form which ravages the banks of the Plata is the latter, for I sent one of the two specimens with which Mr. Darwin supplied me to the Rev. M. Berkely, who is far better authority on such a point than myself, or than any one else in this country. His remarks are as follows:—"Your rust appears to me the same with what I have received from Ohio, and agrees with our European species, which is referred to U. linearis, distinguished from U. rubigo vera by its longer spores, and by the more inflated cuticle of the sori. I believe U. rubigo vera to be the young of the common mildew. I have never myself gathered U. linearis. The La Plata specimen exhibits plainly the myceloid base. I have also U. rubigo vera from Ohio with the European characters."—*J. S. Henslow, Hitcham, Sept.* 9.

ON SEA-WARE.

Some of your correspondents have noticed the properties of the Alga marina, and the modes of using it, but not so fully perhaps as might have been expected. The names of Varech, Wrack, or Wreck, by which it is designated by the farmers on the coasts of Brittany and Ireland, where the Celtic is the vernacular language, explain to the etymologist their true signification—substances thrown up or torn away, as the sea-weed is, by the force of boisterous waves. Strange to say, the authors of the "Cours Complet d'Agriculture" have asserted, without even a modest doubt of the correctness of their judgment, that all marine plants, so called, are animal productions, though resembling the latter in form and organisation: they considered them to be either the remains of animal matter or the receptacles of animals, confounding all the tribes of Algæ marinæ with coral fabrications, &c.

The primitive mode of using sea-ware was, probably, that of spreading it on pasture land; the more artificial system of applying it to the formation of composts, and the blending of it with the soil by the plough or spade, were subsequent steps in the progress of husbandry; yet, though various methods of combining this substance with the earth have been adopted, there is no uniformity of practice observed. The spreading of sea-weed very thinly and as fresh as possible produces a rapid alteration on coarse and unsavoury pasture; the quality of the herbage unequivocally shows the beneficial effects of the saline substances which the weed contains, and the cattle which feed upon the new Grasses improve in health and condition.

The best season for putting out sea-weed in this way is in the early part of the spring, at which time too it yields the most abundant supplies; but unless the fields be adjacent to the coast, and the quantity of weed excessive, I do not consider this so economical a mode as that of mixing it with other substances in compost, or that of spreading it on stubbles, if in the winter season, and ploughing it into the ground, by which means it becomes an active agent in decomposing the short straw, which otherwise would be suffered in many instances to wither away on the surface of the land, instead of being rotted and incorporated with it.

It is a common practice in some parts of Ireland for the peasantry whose fields may be a few miles from the strand, to collect and dry the weed in the latter part of spring, if it should at that period be wafted to the coast, and to convey it when dry from the influences of the sun and wind, in large bulk to their Potato-drills, over which they shake it thinly, but not actually in contact with the germinating sets, which perhaps have been in the ground a fortnight previously. This mode, however, indicates the inability of the person who so uses the weed, to manure his crop at the usual time, and with a better material. Four moderately-sized (one horse) cart-loads saved in the above way is sufficient for a rood of Potatoes, the ultimate success of which is most uncertain, depending on the timely application of the weed (which in a calm season may not be collected), and the subsequent humidity of the atmosphere. As regards the succeeding crop of Corn, this mode of applying the weed is the most defective; but the immediate effect upon the vegetation of the plant from the absorption of the saline matter is very apparent, though I have never seen large tubers raised in this way (nor very farinaceous ones with any modification of the manure in question), comparatively with the other methods. In dry weather the weed lying on the surface shrivels up; but when affected by moisture it expands again. The salt, which does not evaporate like gaseous matter, acts in a humid atmosphere continually as a stimulant; yet common salt, if scattered over the ground, would not serve in the same manner. There must, therefore, be certain combinations formed that favour vegetation, by means of the excessive susceptibility of absorbing moisture from the atmosphere which the Algæ marinæ possess.

On the coasts of Brittany and parts of Normandy, sea-weed is sometimes reduced to ashes in order to obtain the alkalies they yield by this process for manure (I am not alluding to the common operation of kelp-making), which is spread on the surface. This, I think, is a wasteful way of using it. The most generally convenient and profitable manner of converting sea-weed into manure is to remove it from the beach as soon as circumstances admit, and to lay it on a substratum of sand, loose mould, or scourings of ditches, to absorb the oily juices and salts which the weed contains, until he can find leisure for taking it away. The force and rapidity with which the fluid penetrates through the subjacent layer, and rots whatever vegetable substances it may contain, is astonishing. In the course of putrefaction the weed generates maggots and flies in immense quantities—a living testimony to the richness of the matter which produces them. For stiff soil, which this weed of itself has a tendency to render still more cohesive, a mixture of sea-sand is preferable to that of clay, as the latter would answer better for a light sandy soil; but any calcareous sand and a rich loam can never be otherwise than valuable recipients of the sea-weed, which should be fully blended with the substratum, whatever that be, until the whole becomes a black mass of well-pulverised compost, which any one possessing the sense of smelling will perceive to contain a great portion of carbonic gas—the principal food of plants. A compost of this nature is a chief resource of the farmers in the baronies of Forth and Bargie on the Wexford coast; without it many of them would be poor indeed; by means of it they are enabled to raise some of the heaviest crops of Beans and Potatoes that I have ever seen.

In the Sketches of East Lothian Husbandry it is considered a very useful species of manure for the light dry soils adjacent to the coast, but not advantageous on clays—"immediate, but transient in its effects," "seldom lasting longer than a single crop." It is certainly much better for light than heavy lands, but I have found it very efficacious on stiff soil also, when applied in the compost form; it is "seldom mixed," in Berwickshire, as the Report continues to state, "with other substances." If it were combined with sand, the mechanical effects of which in loosening cohesive soil are so perceptible, it would be found effective. As to its being transient, "only lasting for one year," so is guano, which, on the high authority of Professor Buckland, is so volatile, that it produces but one crop. But this mode of expression is practically incorrect, for these volatile manures cause the earth to yield two crops, sometimes three; Potatoes or Turnips, succeeded by a Corn-crop, may be followed in many cases by Clover. Though the properties of such manures be too evanescent to afford nourishment to a second or third crop, they are the agents through which the farmer is enabled to pursue the course of preparation of the soil, by which he renders his land productive of the succeeding crops. The great degree of tilth which usually accompanies manured green crops insures, on a soil of good quality, which has not been exhausted by over-production, a crop of Barley succeeded by Clover. Supposing a sufficient quantity of lime applied to the Clover-ley, for Wheat, after it has been fed off by sheep or cattle (not mown), the farmer will find his compost of sea-ware, &c., again successful in the second rotation, immediately after the Wheat; but he will act more judiciously in using farmyard dung, the superior value of which is undoubted, if he can. Judiciously managed, sea-ware, though far less permanently beneficial than other manure, is a valuable auxiliary to any sea-coast farmer, because it affords him the facility of pursuing his regular rotations if the farmyard dung be insufficient; and to the poor peasant it is in countless cases the sole means which he possesses of raising his Potato-crop. But except to husbandmen, whose land is close to the shore, the collection of sea-weed ought not to be systematically an object of anxiety, because the gathering and removal of it, if the distance exceed a very short space, greatly interrupts the regular routine labours of a farm, and occasions much fatigue to the horses employed in drawing it from the shore to the bank, during the busy intervals between the tides which bear it to land; and such labour and fatigue are hardly compensated by the acquisition of it, unless the subsequent cartage be inconsiderable: to the farmers who cultivate the sea-coast of Berwickshire, and who are, in every respect, among the magnates of their valuable order, I can well conceive that an influx of sea-ware is unimportant; to those who can accumulate, *ad libitum*, the best farmyard dung by means of cattle, Turnips, oil-cake, and straw, the extraneous manure which the sea affords, with more or less profusion, is not an object of much value.

But to the petty farmer, who is not "rich in cattle," and more particularly to the Irish peasant, whose pig is his only dependence for the accumulation of half a dozen little cart-loads of manure, sea-weed is indeed a boon, for which he thanks Providence; and if such miserable human beings as those are who occupy the coast of Mayo were once in a condition to maintain a few cows, on the alternate system of green and white crop, and could be induced to raise Turnips, Rape, and Cabbages with composts of sea-ware and sand, they would be enabled to apply the manure generated by the cattle to the raising of Potatoes, which being, in such case, far more abundant in quantity and much better in quality than they are under the present uncertain mode of management, would deservedly maintain their character of the "vigour-stirring root" and become a wholesome food, instead of being so decidedly the contrary, as they are when deficient in farina—weak, washy, and innutritious, as Potatoes raised by sea-ware in unpropitious seasons always are. With calcareous sand, or a very moderate allowance of lime, a limited quantity of farmyard manure produces the largest crops of Potatoes, and of the best quality; an excess of rank dung indeed would be as pernicious to the quality of the Potato as a dose of sea-weed; but used in moderation, after an application of lime, no other manure can compete with it for producing the main support of the Irish peasant. The amelioration in the physical condition of the poor occupants of land on the sea-coast, which would be consequent on their adoption of such a system as that to which I have referred—the application of sea-weed to green crops for cattle—would be incalculably great.—*Martin Doyle.*

Home Correspondence.

Two Crops per Annum.—A manufacturer replied to a croaking farmer that, if he could not live with one harvest in the year he must have two, as they were obliged to increase their spindles. Now, in Belgium, through which I passed last week, they appear to approach this desideratum. I saw all the land which had borne a crop of Rye covered with Carrots, and that which had yielded Oats covered with Turnips. The latter I can understand, for I noticed that they did not let the stubble remain even till the Oats were carted, but set the shocks closely in a line and ploughed between them; but how they get the Carrots, I am free to confess, puzzles me. It must answer their purpose for the feed of cattle, to which use they are applied, otherwise the system would not be so general; and why not, therefore, introduce it here? Perhaps, Sir, you will be good enough to investigate this matter, and favour me with the result. I may remark that Rye and Oats seem the only grain-produce of the country; there is very little Wheat or Barley. If Carrots could be produced on our light soils, which grow Wheat, it would greatly help our milch cows in winter, and furnish labour for our too dense population in clearing away the stubble and hoeing the land after harvest, an occupation in which King Leopold's subjects seemed mightily busy last week.—*Cantab.* [We will ascertain the Belgian practice in this particular.]

Wash for Bark of Trees.—Your Correspondent in the *Agricultural Gazette* will find that a wash made of two-thirds cow-dung and one of lime, laid on with a brush, is an effectual remedy against cattle injuring the bark of trees; add a little tar if to protect from rabbits and hares. —*W. Shirley.*

Ireland.—During a journey in the south of this country I stopped at Castle Martyr, in the county of Cork, and found a fine residence of Earl Shannon, and some good farming on a light loamy soil. For some years past that nobleman has imported Ayrshire cattle from Scotland, and has bred them at Castle Martyr, where the land steward pointed out to me the very singular deterioration in the breed, very evident in the general appearance of the animal, and most particularly in the increased size of the horn at the base—a sure mark of bad breeding. It was quite easy to distinguish among the herd the animals bred in Ireland from those imported, the skin and hair being much coarser, the head larger, and the whole frame much deteriorated. I have since learned from a friend in Kent that he has experienced the same result, but not so large in degree. My own experience in Leicestershire did not show any deterioration in a herd of 20 cows, which produced very fine calves from a native imported bull, and which bred again from a male also imported; and the progeny seemed rather to improve in quality. Probably some of your readers may have experienced the above results, which seem altogether inverted.—*D.*

Rooks.—They may now be seen in vast numbers visiting Turnip-fields, for the purpose of feeding upon a species of grub, now very prevalent in many places, much to the injury of the crops; instead of destroying them farmers ought to look upon them as their best friends. The grub in question is a larva of a species of moth (Noctua), prevailing only to any amount in droughty summers, which appear to be congenial to the habits of both larvæ and perfect insect. No serious mischief, I believe, has been done by it to vegetation since the years 1826 and 1827. In 1818, which was a very droughty season, I remember its depredations were so great, that there was scarcely a well-matured Turnip to be seen. Teazles also suffered much the same year, and horticultural productions generally shared a similar fate; it likes all sorts of vegetable food—nothing that falls in its way seems to escape its ravages. The grub during the day-time lodges, in dry weather, just within the earth, near to the plant it feeds upon, and burrows deeper in wet weather. It is produced in the months of July and August, and commences feeding by shearing off the young plants close to the surface; when plants are too large it ascends and feeds upon the young leaves, or what is commonly called the heart of the plant. It continues its depredations until the beginning of October, providing the weather be not too wet and cold; about this time it is full-grown, being about an inch and a half long, and of the thickness of a moderate-sized goose-quill; and after descending a few inches into the earth it becomes dormant, in which state it remains until the middle or latter end of April, when it commences its transformation, and in a few weeks assumes the pupa state, and issues forth about the fore end of June a perfect insect—a middle-sized brown moth, which secretes itself during the day in thickets of vegetables or weeds, and there deposits its eggs. The gardener should now be concerned for his latter crops. Rooks are too shy to visit gardens; but much good may be done upon a small scale, by using a knife, or something similar, to search for the grub where he sees drooping or injured plants. I remember in the year 1818, recommending this plan, as well as the protection of his Rooks, to a gentleman agriculturist, who took my advice and employed a number of women and boys, and thereby secured the better half of a crop of Turnips and Teazles, whilst all others about entirely failed, leaving extensive fields little better than fallow land.—*Joshua Major, Knosthorpe.*

Farm Fences.—At page 266 of last year's *Chronicle*, I made some few observations on the ownership of agricultural fences: the following is a note on the tenant's obligation to repair them. It is so notoriously the duty of the actual occupier of land to repair fences, and so little the duty of the landlord, that without any agreement to that effect, the landlord may maintain an action against his tenant for not so doing, upon the ground of the injury done to his inheritance. It is so decided in Cheetham *v.* Hampson, 4th Term Reports, page 319. —*A Quiet Observer.*

New and Old Land.—In a late article under this head, page 580, there are some remarks which confirm my limited experience as to the want of fertility in an old garden, yet I am somewhat puzzled by the opinion of my favourite, William Cobbett, who opposes what seems to have been in his day, as now, the prevailing theory. The annexed extract I have clipped out of paragraph 115 of his "English Gardener:"—"Mr. Missing, a barrister, living in Titchfield, in Hampshire, has a border under a south wall, on which he, and his father before him, have grown early Peas every year, for more than 50 years; and if at any time they had been finer than they were every one of the four or five years that I saw them, they must have been something very extraordinary, for in those years they were as fine and as full-bearing as any that I ever saw in England."—*Paddy.*

Tiptree-hall Farm.—It may be gratifying to you to know that the first field of Wheat we have threshed at Tiptree-hall Farm has produced somewhat over 5 quarters per acre, of a very fine quality, which sold (as much as was ready) at 46*s.* per quarter in the neighbourhood, being 2*s.* above the ordinary market price of the day. I cannot expect the other 44 acres to produce so much; but I hope they will average 4 quarters per acre. You shall know the result. The crop above mentioned was grown after Potatoes, Swedes, &c., drawn off the land. The cost for manuring the two years' crops was 4*l.* 8*s.* per acre. I need not say this is rather more than a usual Tiptree crop.—P.S. This crop was never estimated by visitors higher than 3½ to 4 quarters: so much for estimates.—*J. J. Mechi.*

Steeping Seeds.—Amongst the various steeps for accelerating vegetation, I have not seen chloride of lime mentioned in your Paper. Some time ago I heard from a friend in Germany of its efficacy; French Beans steeped 4 hours in a solution of a quarter of an ounce of chloride in a gallon of water, were up and in rough leaf before others sown at the same time were above ground, and an equal difference was observable with other vegetables.—*Lusor.*

Produce of Wheat.—As accounts of fine roots of Wheat have appeared in the newspapers, I venture to say that Dr. Buckland, who came to East Bourn September 14th to see the 455 allotments of which I receive the rents, there saw a root of Wheat raised from one grain this year, with 125 fine ears 3½ inches long, and apparently averaging 60 grains of Fullard's Prize White Wheat in each ear, and the straw 4½ feet high. Dr. Buckland also saw a hand-basin full of Wheat of the same kind raised by me at East Bourn, from one grain put in the 22d July, 1844, the shoots from which were divided and transplanted twice before Christmas and once afterwards, and yielded—

Roots	173
Ears	3,272
Grains	97,028

Which weighed 7 lbs. 15½ oz.—*Benj. King, East Bourn, Sussex.*——*C.* adds, "On March 1, 1844, I planted four grains of autumn Wheat at eight inches distance and two inches deep; one grain I laid on the surface, and covered it about half an inch deep; the grain produced six stems and ears. Of the four that I planted, one produced 29 stems and ears; the other three produced 22, 21, and 20: thus making in all 92 ears, the average number of grains to each stem was 20; in all 1840 grains. I was induced to try the experiment through the farmers telling me that autumn Wheat would not produce a crop if sown in spring; it has occupied the ground six months and two weeks."

Fence for Trees.—I have seen and heard of many ways of fencing single trees against cattle; the fences generally used are wood and iron, varying in price from 3*s.* to 21*s.* each. I have used for many years, (and have recommended the same to others, and in no instance have I known it fail,) the following plan, viz., make a circle of stones—the rougher in reason the better—around the tree, at such a distance that no cattle can get to the stem nor branches, without treading upon them: that they will not do, and thus the stones answer for a cheap and durable fence; when no more wanted they are not the least injured, which is not the case with wood and iron.—*J. S.*

Weeds.—Your Correspondents will much serve many in this neighbourhood if they can mention any mode of extirpating what we here call Furze from the pastures (properly, the Rest Harrow—Ononis arvensis), now in full flower, and just seeding. It is the most destructive weed in the meadows, increasing prodigiously, and with its sharp thorns injuring cattle in grazing. We are here accustomed to mow it off, just to prevent the seeding, and, where not thick, digging or spudding it up, and occasionally pulling with pincers; but the long woody roots spread a great distance. If any one once troubled with the Pink Furze or Rest Harrow can say how he has got rid of it, his experience will be much valued.—*H. C.* [We know of no other method of destroying this weed than perseverance in cutting it off and pulling it up. Does any one else?]

Cabbages.—I am a grower of large Cabbages this year, and have, considering the season, been rather fortunate in my crop. As I intend to keep them as long as I can for winter food for my stock, and am also desirous of preparing the land on which they grow as early as possible for the next crop, can you, or will any of your readers, favour me with the best ascertained mode of stacking and preserving them, after they are gathered, through the winter? It is of vast importance to ascertain the best possible manner of preserving such a crop, after gathering it, especially during the ensuing winter and spring, when all cattle food is likely to be so valuable. I shall be very much pleased to receive information from you or any of your readers; and whatever plan I may adopt, I shall derive much pleasure in communicating the result of it, through the medium of your publication. —*Querist.* [We must refer this question to some of our readers. We have never seen Cabbages stored together in any quantity, and have always assumed that the only method is to sow them in successive plots, and consume them as they successively ripen. Sailors keep Cabbages by hanging them individually up by the roots. We doubt the possibility of keeping any quantity together for any length of time.]

FARMERS' CLUBS.

Darlington Farmers' Club.—The September monthly meeting of this Club was held on Monday last at the offices of Mr. Thos. Dixon, Land Agent and Agricultural Engineer, their Honorary Secretary. The subject under discussion was—Wheat-sowing, with the preparation of the Land and Seed, and the proper time for Sowing. In opening the meeting, the chairman observed that the subject they were then met to discuss was one of very great importance to the tillage land farmers of this neighbourhood, and one that he thought deserved more attention than was sometimes bestowed upon it, more particularly with regard to sowing Wheat on Clover leys; and his opinion was, that it was better not to sow when the land was in a very wet state, more particularly in a late season, for in such a case he thought it much better to run the risk of a still later season, and have the land in a tolerably dry and firm state, than to sow it very wet, he having himself experienced the ill effects of wet sowing. He then gave in detail an account of a field of Clover ley, part of which was sown while the land was wet, and the remainder some time later, when the land had got into a drier state; the crop being much superior on the dry sown land than on the wet. The unanimous opinion seemed to be, that it was desirable to avoid sowing when the land is in a very wet state; and, whether sown broadcast or drilled, it is better not to sow the land too soon after being ploughed, as Wheat is found to answer much better when the land has been ploughed a while beforehand; the seed then gets a firmer bed, which is now believed to be very essential to its success. With regard to the preparation of the seed, it was believed that, in all ordinary cases, the method at present followed in this neighbourhood as a preventive for smut answers well; which is, wetting the seed thoroughly with stale urine, and afterwards mixing it with quicklime; or where urine cannot be had in sufficient quantity, salt and water is used in lieu of it; the preference, however, is given to urine, where it can be had. It was also believed that where it is unavoidable to sow smutty Wheat, one of the best remedies known is to wash it in vitriol water, instead of wetting it with stale urine. Drilling and ribbing Wheat was considered by the members preferable to sowing broadcast in all cases where practicable, as by that means the land can be hoed whilst under crop, and kept much cleaner, and thereby not exhausted by growing weeds. It was also considered that a less quantity of seed per acre than what has been generally sown would answer equally well, if not better; and where two bushels per acre has been regularly sown, it was believed that six pecks per acre would be sufficient. And in support of this principle Mr. Joseph Johnson mentioned an accidental circumstance which happened in his own practice, which was as follows:—Some years ago, having as usual prepared the seed-Wheat in the morning for the day's sowing, it happened from some cause or other (he believed from the urine being too strong) that such parts of the seed that were sown in the early part of the day sprouted as usual, and grew well, but such parts as were sown in the latter part of the day came up very much thinner, a considerable portion of it not having

vegetated at all; that part of the field which was sown in the latter part of the day looked for some time much too thin, and likely for a failing crop, yet when harvest came it was quite as good if not superior to the other that was sown in the morning. He also further stated that he was now in the habit of sowing less seed than formerly, and he found it to answer better. He also now, in drilling his Wheat, gave it more room betwixt the rows than formerly, and found it to answer better; he formerly drilled his Wheat at 6 inches, but now, and for the future, he would always give it 9 inches betwixt the rows; it thereby tillered better, and was better to hoe and clean. At the conclusion of the discussion it was unanimously resolved,—1st. That it is desirable, in sowing Wheat, to give it a firm bed, and therefore to have the land ploughed a week or two before sowing; 2d. That in preparing the seed, it is important that it be thoroughly mixed with the urine or brine, so that every grain is wet before adding the lime, and then that the whole of it should be well worked together; 3d. That the best time for sowing Wheat is from the middle of October to the middle of November.

Castle Douglas.—We take from the *Dumfries Courier* the following extracts on subsoil-ploughing, from a lecture by Professor Johnston, lately delivered here:—The under soil very often contains what the upper soil requires. Take the example of lime; it has a tendency to sink into the earth, and is retained by the subsoil out of the reach of the common plough; and if thus a sufficient quantity be found in the subsoil, all that is necessary is to use the subsoil plough. There is, however, no little danger in subsoiling * without a proper analysis having first been made. While one farmer near Edinburgh found so much advantage in subsoiling as to make him declare that he had turned up a second time the whole of the city dung, another farmer trench-ploughed a field, and he declared that by such a process he had lost many tons of Turnips per acre, and the reason of this loss was obvious. When the soil was analysed it was found that he had buried the upper soil, which contained 30 per cent. of vegetable matter, under the subsoil, upon which he grew his Turnips, which subsoil contained only 7 per cent. The utility of trench-ploughing is true as a general principle, but it is not universally beneficial. It might be of advantage, before trench-ploughing, to prepare the lands, so that the roots of plants might be allowed to go down to the subsoil and feed thereon as much as possible. Another question regarding the fertility of the soil may be here asked. Must a soil be of necessity fertile if it contains all the ingredients of a soil possessing fertility? Practical experience answers in the negative; and why? Because there may be something in the soil noxious to the plant; and if so, the plant will not grow; and some substances in too large quantities, as, for instance, common salt, oxide of iron, or manganese will prove destructive. If noxious matter is contained in the upper soil, the plant is always sickly; and if this matter be absent in the upper, but present in the subsoil, then the plant has a reluctance to go down; but if it does enter the subsoil it sucks in the noxious matter along with its aliment, becomes poisoned, and cannot thrive; hence the cause why plants for a season, as in braird, &c., appear healthy and fresh, but when they reach a certain stage, their roots having forced into poisonous subsoil, become blighted and die. The subsoil is not easily doctored by surface medicines. Lime to it is only capable of making a partial cure. Another cause of infertility is the excess of water. A great quantity of clay lands are allowed to lie in perpetual Grass, because they are not drained. Though they contain all the richness of soil necessary for abundant crops, the excess of water prevents the development of their riches. The presence of water renders the soil cold. Evaporation draws the heat from the land just as it draws it from a person's hand if dipt in water and exposed to the action of air; and during a smart breeze of wind the air sweeping over an undrained tract of country is much colder than that in another tract similar in every respect, but in being thoroughly drained. A thermometer buried half an inch under the surface of a drained field, on a hot summer day, will rise to 120, but in an undrained field it will not exceed 80 degrees. Bottom-heat is absolutely necessary for vegetation; hence gardeners prefer it to a hot atmosphere. Another fact is, that the colder the ground the more subject it is to be saturated with the dew by night, and the rain by day. We frequently see mist resting and falling on one part of the land, while, without any perceptible cause, it is absent in another spot—and this alternation over a considerable extent of country; and the reason is just because of the dampness and dryness of the soils. The farmer who refuses to drain is punished by an excess of dew and rain; while the farmer who relieves nature by draining is treated with kindness by natural laws, imparting heat and consequently fertility. Excess of water not only prevents the plants from going down, but it also prevents the air so necessary to vegetation from entering the under soil, and little good can be expected unless the air be freely admitted. Draining may be considered the foundation of all other improvements; for, unless the excess of water be carried off, all other improvements will be ineffectual. You cannot allow the air to enter the soil unless the water be carried off, and by admitting air you can change the nature of many noxious substances contained in the soil. In undrained lands the ridges are so much saturated with water, that when rain falls it cannot be received into the soil, but is forced to flow on the surface, carrying with it any soluble substances within its reach, into the ditches, and from thence into the rivers, where portions of it are thrown out or deposited along the banks of the rivers in holms, giving to those alluvial soils their richness, or, what is still worse, carried into the sea and lost; whereas, in drained lands, the rain enters as it falls, and, in the process of filtration, deposits its own riches, while it loses the power to carry off the soluble portions from the soil; but, besides not carrying off valuable matter, it sucks into the earth the upper air with its rich draught of fertilising matter, and as it carries it away by the drains it destroys the noxious matter in the subsoil down to the level at which it escapes. Draining is assuredly a most economical method of farming;—in some localities the whole expense will be covered by the extra crop of the first year, in others in two years, and certainly it will never exceed five years;—so that for a tenant to drain, even at his own individual expense, the returns would be profitable during a lease. Supposing a farm to be fairly rented, in an undrained state, at 30*s.* per acre, and that it would take the maximum term of five years to cover the outlay, and that the draining had improved the land to the extent of only 5*s.* per acre for the remainder of the lease, here would be a clear profit of 3*l.* 10*s.* for every acre, or 700*l.* for a farm of 200 acres so improved. There are different methods of draining land. It should be done so that it would be permanent—not merely to last a lease of 19 years, but to be efficient for 100 years; and hence landlord and tenant should unite in the matter. If the land is rented at a fair price undrained, and the tenant cannot afford to drain it thoroughly, then should the landlord be at the expense, and the tenant pay a fair per centage for the expenditure. If the farmer is averse to this, and can supply labour, then might the landlord furnish tiles, &c., and the tenant the labour. But in whatever way it may be done, it ought to be done thoroughly, so that it may be both a personal and national benefit. Much money has been wasted in draining, by the drains being too shallow. The best practical agriculturists recommend that tile-drains should not be less than 30, and stone drains not less than 36 inches deep. Some persons object to these depths, stating that they won't draw. This objection, however, is long ago exploded, and the necessity of deep draining made apparent by the depth to which subsoiling ought to be carried. The roots of some plants require a great depth of soil. Wheat, for example, will go down 3 feet; and a great number of practical agriculturists subsoil to a depth of 22 inches.

* Professor Johnston probably referred here to *trench*-ploughing, not to subsoil-ploughing, as indeed the next sentence proves. Subsoil-ploughing could never injure the surface soil, provided the land were drained, because whatever deleterious matters might exist below, none of them are brought to the surface by the operation.

Reviews.

Agriculture; its Practice with Profit, elucidated in a Contrast of Oriental and British Usages; in a Correspondence with the Royal Agricultural Society of England. By Henry Newnham. London: Roake and Varty.

The first letter in the series here published is from Mr. Raymond Barker, who, as Chairman of the Finance Committee of the English Agricultural Society, requests from Mr. Newnham, a member of that Society, the payment of the arrears of his subscription for the years 1841, 42, 43, and 44. Mr. Newnham, it appears, had thought that "the Association was, with respect to annual subscriptions, based on the same principles, and governed by the same laws, which obtain in similar bodies, as for instance the Royal Institution, and in associations such as clubs; and he therefore considered that continued absence from its meetings, and the discontinuance of annual payment of subscription, constituted the established mode of seceding from its association." And in his answer, extending over 21 pages, he states the reasons which four years ago induced him to form the resolution of resigning his membership. The reasons he adduces did not satisfy the Council of the Society that any exception from the operation of its ordinary rules in this matter should be made in his favour; and in the remaining letters of this correspondence, the reader is informed that Mr. Newnham, having "no inclination to have aught to do with the lawyer of the Society," paid up his arrears, and received an official acknowledgment of the same from Mr. Hudson, the secretary.

It is to the second letter, the chief feature in this correspondence, that we would direct the attention of our readers. Excepting one point, on which, however, though he classes it amongst his reasons of withdrawal from the Society, Mr. Newnham does not appear to lay so much stress as it deserves, we think it not difficult to justify the Society from the charges here brought against it; their truth may be admitted without rendering its Council blameable for impolicy, injustice, or want of skill in conducting its affairs.

The first objection raised by Mr. Newnham to the proceedings of the Society, is the effect which he insinuates they have had of diverting the views of farmers from the results of ordinary experience, or from what he calls natural chemistry, to the theories and speculations of scientific men, as the proper foundation of practice. He refers especially to the expectations which have been held out, that the progressive advance of chemistry may aid in developing the resources of British agriculture. His motto is "Practice with Profit," in contradistinction to that of the English Agricultural Society, which is "Practice with Science." It appears to us, that he supposes the motto of the Society to be expressive of the end for which they labour, instead of being expressive, as it is, merely of the means by which they propose to obtain a profitable end. It is too late now to rail at science as visionary and baseless. The evidence in support of the facts, the accumulation and classification of which constitute science, is stronger far than that on which most of the crude notions are built of many of our thoroughly practical men. We have now men who can testify from experience to the profitableness of uniting practice with science; and this testimony is unaffected by the lamentations of others, who may be insolvent as farmers, not from having adopted such a union, but from breaking it, and attempting to carry on their business unassisted by one of its essential elements—experience. Natural chemistry—for so Mr. Newnham dignifies the results of agricultural experience—which points out the advantage of chalking clays and marling sands, and of employing as manures farm-yard dung, peat-ashes, rags, lime, &c., so far from having been neglected, has been much enforced and explained by the application of chemical science to agriculture, under the auspices of the Society.

The second reason which Mr. Newnham gives for having seceded from the English Agricultural Society is "the encouragement which," he states, "they have held out to the substitution of mechanical power for human labour." He alludes to their annual award of premiums to further the improvement of our agricultural mechanics. His objection, if reasonable, must apply not only to Agriculture, but also to all industrial employments; and there were, doubtless, many patriotic and well-meaning men who objected half a century ago to the improvement of the machinery of our cotton and woollen factories—to the very means, in fact, as they have since turned out, by which the numbers of those employed in these factories have been a hundred-fold increased. This result has depended on no accident peculiar to the cases in which it has been realised; it is merely a consequence of the natural connection which exists between an improved and cheapened means of production and an increased consumption of produce; and we believe that in Agriculture, also, any means which cheapen the cost of production are thus productive of national benefit; it may be difficult to follow them through all their influences, but we may depend upon it that they will terminate in causing what is termed higher farming, and in the employment of more labour than ever. Mr. Newnham here digresses into an account of the various practices of Indian Agriculture, a chief feature of which appears to lie in the custom of paying for labour according to the produce of the land—the fraction of the produce which falls to the share of the workman being inversely proportional to the abundance of the harvest.

Mr. Newnham's third reason for withdrawing from the Society, viz.—its disregard of the subject of parochial assessment, however accurate his views on the matter may be, is obviously insufficient, if we consider the nature of the tie which holds the Society together. The exclusion from the subjects of the prize essays of a matter of such vital importance to Agriculture as the present mode of assessing the poor's rate is a consequence of the law which, we believe, lies at the foundation of the Society's existence—the law which forbids the discussion of matters to be brought before Parliament.

The liability which hangs over every farmer who commences the work of agricultural improvement—his liability to an increased charge as respects all parochial rates—involves the apparent injustice and obvious impolicy of assessing that man most for the support of the poor who employs the greatest number of them, and him least on whose non-employment of them the existence of pauperism may chiefly be chargeable. It would be well, we think, if security by legal enactment from this liability were given to agricultural improvers for terms of years, varying according to the permanency of the several descriptions of improvement which they may have effected.

If we have hitherto been exhibiting reasons for withdrawing from the Society, the entertainment of which may appear reasonable to many minds, and may even to some justify the step which Mr. Newnham has taken, we fear that the sympathy which that gentleman has thus experienced will not continue to follow him while he details his fourth reason for seceding. He withdraws from the English Agricultural Society "because they have altogether overlooked and disregarded the science of Astronomy!" Had the word been Astrology, it would have been more in keeping with the singularity of the idea. A capability of prognosticating the weather, which he thinks a skilful application of Astronomy to Agriculture (!!) would confer, would doubtless, in our variable climate, often prove of great service to farmers; but this is to be obtained, not by carefulness in recording astronomical observations, but by wide-spread and lengthened series of observations of the meteorological appearances which precede meteorological changes. And to this subject the Society has devoted a reasonable share of its attention, by offering a prize for the best Essay on Weather Prognostics.

But Mr. Newnham must speak for himself; the following is his illustration, somewhat in Hindoo phraseology, of the advantages of *applying astronomy to Agriculture* (*!*). It may sound sensibly enough to the ears of those who have lived long in tropical climates, and who look for the annual changes of the weather as regularly as for the months which there they severally characterise; but to English ears it certainly appears to be sufficiently ridiculous.

"Neighbour, let us discuss according to our atmospheric tables the probable season to come. In *Taurus* (April), we had excessive drought. In *Gemini* (May), we have had nipping cold and long continuance of dry easterly wind; what sort of season do these anomalies portend in *Crab* (June) for sowing the Swedes? or what may be their effects on the coming harvest?—

the markets?—the sowing time? Shall we thrash out our Wheat now, or lay by awhile for a better price?"

If these questions had been or could be accurately answered by Mr. Newnham's oriental astronomy, his advocacy of its agricultural applicability (!) would be reasonable enough. But so long as this is impossible, we cannot but see an inconsistency in his setting himself up as the defendant of practical men and the advocate of practical measures, against a Society whose motto is "Practice with Science," and in his at the same time suggesting and enforcing the plausibility of ideas which are amongst the most visionary that ever were broached.

We agree with Mr. Newnham in the fifth reason which he gives for withdrawing from the Society, although we think it altogether insufficient to justify that step. He objects to the expensive encouragement of the pure breeds of cattle and sheep which is given by the Society in their Annual Shows and Premiums. However much good in this respect may hitherto have been done by the patronage of Societies and wealthy individuals, we think that the further improvement of animals for the dairy, feeding-stalls, &c., may now safely be left to individual enterprise, and that the income of the Society might now be more exclusively devoted to the improvement of cultivation-proper, by the diffusion of sound information on the subject, or perhaps by the establishment of example farms in the various districts of its connection.

In taking our leave of this pamphlet, we may safely assert that Mr. Newnham by its publication has failed in justifying the charge of impolicy, which he seeks to bring against the English Agricultural Society.

Miscellaneous.

Potato Failures.—In last week's paper we had the pleasure to copy from a Scottish cotemporary a report, amongst other matters, of the highly interesting discussion which took place at one of the forenoon meetings of the Scottish Agricultural Chemistry Association, in Glasgow, on the subject of Potato failures. This meeting had been announced for some time, some very eminent agriculturists attended it, and nothing can better show the exceeding difficulty of the question mooted—viz., What is the cause of the Potato failures, and is there a remedy for them?—than the discrepancy of opinion advanced on the occasion. The general opinion of scientific agriculturists appears to be, that there is a liability inherent in every plant which has for a long period been cultivated in the same soil to become deteriorated, hence the universal belief in the advantage of changing the seed; and that, in the case of the Potato, the most likely means of avoiding failure would be to procure a new generation of plants from seed (not tubers) of a healthy crop; but in the discussion to which we are referring, Mr. Girdwood's experience gave the death-blow, *in limine*, to this cherished opinion; the seedlings (whether raised from a healthy or tainted crop is not stated, however) were found to be as liable to decay as any others. Plant your Potatoes whole, and in the autumn, use only such seed as have the eyes plump, protect from frost, and, says Theory, you will have no failures; not so fast, says Mr. Burnet, of Gadgirth, I have done all this, and still have experienced failures. Mr. Alexander, of Southbar, had never witnessed a failure in early-planted Potatoes; how many, within a few miles of Dublin, would give a great deal to be able to say the same truly; why early-planted Potatoes are the most liable to failure; and as to this gentleman's other statement, that the failure of Potatoes is traceable to some ill-treatment, especially by stowing them in large masses, did it not occur to him that, up to 1832, no failures were caused by such treatment! Mr. Allison, of Mears, stated that Potatoes taken from those which, for two seasons, had not been cut, would not fail; it is, we fear, mere assertion; whole Potatoes, although not so liable to failure, we believe, as cut ones, still, it is notorious, do fail. Mr. Anderson, from the north of Ireland, as appears from his statement, has been most successful in his efforts to avoid failures; and the means he adopts, viz. liming the ground, planting only in drained land, pulverising the soil well, and not leaving either the manure or seed exposed to the effect of the sun and wind, are based on sound practical knowledge: his experience, however, that Potatoes which have been prevented from blossoming are not less liable to fail (if that were his meaning), does not accord with that of some of our correspondents; nor with that of others, if it be that Potatoes so divested do not yield larger crops. Mr. Anderson's experience, however—if he be, as we suspect he is, the excellent and practical land-agent of Sir Robert Fergusson, Bart.—at least since the commencement of the Potato failures, has been in a mountain district; where, it is well known, Potatoes are not so liable to fail as in lowlands. The successful practice of Mr. Reid, as mentioned by Sir Robert Bateson, Bart., of raising Potatoes intended for seed before they are quite ripe, and leaving them on the ground to be dried in the sun, although Professor Johnston declared that he had never heard of it, is known and practised successfully by almost every gardener with his Ash-leaved kidneys intended for forcing. And as to Mr. Fleming's experience—that the Cup Potato does not fail—we can only say, that such is not the experience of the farmers of this country. This discussion was, in fact, an epitome of the innumerable essays which for the last twelve years have appeared on the subject of Potato failures; and which may be resolved into this, that we are utterly ignorant of the cause of these failures, and that our only chance of avoiding them is to use mountain-grown—which often means unripened—seed which has been preserved from heating in narrow pits—to plant in dry, deep soil, at a moist time, using moist manure, and not permitting the sets to lie exposed—even for a few minutes—to the parching effects of sun, or harsh wind.—*Dublin Farmer's Gazette.*

Threshing Machine.—There is now in operation at Twarnhayle experimental farm, belonging to S. and R. Davey, Esqrs., a threshing machine, which, from its simplicity of construction, and its great power, is a vast improvement on the former threshing machines, or those now generally used. It performs the work of three horses, and threshes 125 sheaves of Wheat and 225 sheaves of Barley or Oats in an hour; and this is performed by a poor pony of 13 hands high. The inventor is a miner, named Michael Harris, a poor man residing at Silverwell, in the parish of St. Agnes, who is possessed of surprising natural genius, and therefore deserves support. He carries the whole apparatus about in a small cart, and contracts with the farmers of the neighbourhood at per 100 sheaves. Several gentlemen have seen the machine, and pronounced it to be the greatest improvement yet made.—*West of England Conservative.*

Notices to Correspondents.

CHICORY.—*A Beginner.*—See *Gardeners' Chronicle* of May 11th, where you will find that the land should be cultivated as for Turnips, and 2 lbs. of seed per acre, sown in the end of April on ridge-drills, in rows alternately 16 and 4 inches apart. The plants should be singled out to 4 inches apart, and they may be harvested in November, when an average crop will weigh from 3 to 5 tons per acre.

DAIRY PRODUCE.—*A Constant Reader* will feel greatly obliged by any of our correspondents giving a rough estimate of the number of cows required to produce, per annum, 29 cwt. of butter, 12 cwt. of cheese, 1000 gallons of milk, and 80 gallons of cream; and likewise of the quantity of land necessary to *stall-feed* the said stock. A cow will, in ordinary circumstances, produce 2½ cwt. of butter per annum, or 3½ cwt. of cheese.

MANURE TANKS.—*Omega.*—If your liquid-manure has its volatile parts fixed, you may economically apply it to Grass land in winter; if its ammonia be not fixed, you had better make use of some fixer, or wait till spring before applying it. When once its ammonia is fixed, no fermentation in the materials with which it may be mixed will effect its release.

MOSSY LAND.—*T. D.*—The application of lime is said to be sometimes successful in eradicating Moss.

PARISH RATES.—*Querist.*—By the Parochial Assessments Act, passed in 1836, the rate for the relief of the poor must be made "upon an estimate of the net annual value of the several hereditaments rated thereunto, viz., of the rent at which the same might reasonably be expected to let from year to year, free of all usual tenants' rates and taxes, and tithe commutation rent-charge, if any, and deducting therefrom the probable average annual cost of the repairs, insurance, and other expenses, if any, necessary to maintain them in a state to command such rent." A form of Rate, containing amongst others, columns for the "Gross estimated Rental" and "Annual Value," are given in the Schedule to the Act. It would not be practicable to give an explanation of this ill-worded section in a short space, and we therefore refer you to an Instructional Letter of the Poor Law Commissioners on the subject, published in their third Annual Report, Appendix A, page 92, where the mode in which the net annual value should be estimated, and the distinction between gross and net rent are explained and exemplified. In the instances of assessment given by you there must, from some extraordinary circumstance, have been a great change in the annual value of the property, or the valuer must, at one of the two periods mentioned, have entirely lost sight of the provisions of the above-mentioned Act. Saleable underwoods only are rateable, and not timber.—*W.*

RED CLOVER.—*A Dairy Farmer.*—It is rarely economical to sow Red Clover without a Corn crop. From 6 to 12 lbs. of it are generally sown per acre in April along with the Barley. Two or three cuttings may often be had before the ground be ploughed up in autumn. You may do what you like with these cuttings, but you can rarely get more than one made into hay.

STEEPS.—*A Subscriber.*—We have not forgotten. Sulphate of soda has been found a useful manure for Potatoes. We shall be glad to know the results of your experiments.——*V. V. V.*—Professor Johnston recommends as a steep for Corn and Beans, phosphate of soda, sulphate of magnesia, nitrate of potash, common salt, sal-ammoniac or sulphate of ammonia; a mixture of 1 lb. of each in 10 gallons of water to steep 300 lbs. of seed—we presume for about twenty-four hours: the seed to be taken out and dried with gypsum or quicklime, and immediately sown.

TULL'S SYSTEM OF CULTIVATION.—*Omega* suggests that the effect of a thorough cultivation, such as Tull recommended, is similar to that of what is termed root-pruning; the effect of both being to induce a plant to draw its nourishment from deeper sources; and the benefits derived from the practice of the former system he attributes to the plant thus living upon warmer food. The chief advantages of the system consist, we apprehend, in the plant being enabled by it to lay hold of all the vegetable food which does exist in the soil, in the air being allowed to permeate the soil, and in the destruction of weeds.

*** As usual many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, Sept. 23.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	10	to 4s	2	Best Downs & Half-breds	3s	8 to 4s 0
Best Short Horns	3	8	4	0	Best Long-wools	3	8 3 10
Second quality Beasts	3	0	3	4	Ewes and second quality	3	0 3 6
Calves	3	4	4	0	Lambs	3	8 4 4
Pigs	3	4	4	0			

Beasts, 2469; Sheep and Lambs, 23,010; Calves, 139; Pigs, 380.

Our supply of Beef is rather shorter to-day, and of the best qualities there is a lamentable deficiency, fully two thirds of the quantity being little better than stores; in consequence, we have an advance of quite 2d per 8 lbs. on the first-rate Beasts; second quality are a very heavy trade, and some third rate are hardly to be disposed of. The supply of Mutton keeps steady, but the demand is rather increased to-day; we have a numerous attendance of buyers, at a little more money; some of the best Downs make rather over, and some of the best Longwools rather less than 4s, per 8 lbs; Half breds are a little more saleable than last week, but not much in demand. Very little is doing in the Lamb trade. Veal and Pork are very heavy.

FRIDAY, Sept. 27.

We have rather too many Beasts to day for the demand, amongst which we notice about 80 Dutch, in very good condition; the trade has suffered a decline of fully 2d per 8 lbs., the best Scots, &c., cannot be quoted at more than 4s, and the best Short horns 3s 10d per 8 lbs. The Mutton trade is also very heavy, the dead markets having been very dull since Monday; we cannot, however, make any alteration in our quotation from Monday's statement, 3s 8d to 4s for the best Downs, and 3s 8d to 3s 10d for the best Longwools. Lamb about the same. Calves are shorter, and the best quality make about 4s 4d. Pork-trade is very heavy at late rates.

Beasts, 872; Sheep and Lambs, 8160; Calves, 250; Pigs, 330.

41, West Smithfield.

HOPS, FRIDAY, Sept. 27.

THE Hop Market continues very active for both new and old Hops; the duty is stationary at 130,000*l.* The supply of fine coloured samples is very short, and they are eagerly sought after at high prices. Our present currency is as follows—

Mid & East Kent Pocks.	8*l*	0s	to 9*l*	0s	Sussex Pockets	6*l*	10s to 7*l* 0s
Choice ditto	—		10	10	Choice ditto	—	7 10

New Hay	90	100		New Clover	105	115	Straw	28s to 34s
				,, Inferior	—	—		

COVENT GARDEN, SEPT 28.—The market continues to be well supplied, particularly with the various kinds of autumnal fruit, but trade is not brisk. Among Pines we observed several handsome specimens of the Queen and Providence. Black Hamburgh Grapes are very fine, and these, as well as other sorts, are sufficient for the demand. Pears are fetching a better price than they did last week. The Marie Louise and Brown Beurré bring from 5*s.* to 6*s.* per half-sieve, and good samples of Louise Bonne and Gansel's Bergamot are offered at from 4*s.* to 10*s.* per half-sieve. Apples have not varied since our last report. Among Plums, Coe's Golden Drop and the Imperatrice are tolerably abundant. Damsons are somewhat scarcer, and are also a little advanced in price. Peaches still continue good, and are sufficient for the demand; but Nectarines are scarce. Filberts are also very scarce. Of Walnuts there are plenty, they bring about the same prices as last week. Oranges are scarce. Lemons are tolerably abundant. Vegetables are, generally speaking, good in quality. Celery is very fine. Cauliflowers and Broccoli are also good; they have not altered in price since our last report. Some Brussels Sprouts have just made their appearance. Cabbages, Carrots, and Turnips are plentiful; and French Beans still continue to be well supplied. Onions are good and plentiful; and Endive, Lettuces, and other salading are tolerably abundant. Among cut Flowers we noticed Mandevilla suaveolens, Gladiolus psittacinus, Amaryllises, Jasmines, Camellias, Heaths, Pelargoniums, Fuchsias, Carnations, and Roses.

FRUITS.

Pine Apple, per lb., 3*s* to 5*s*	Figs, per doz., 3*s* to —*s*
Grapes, Hothouse, p. lb., 1*s* to 3*s*	Filberts, per 100 lbs., 90*s* to 100*s*
— Spanish, per lb., 1*s* to 1*s* 6*d*	Walnuts, per bushel, 16*s* to 28*s*

— Imperatrice, per punnet, 1*s* 6*d*	Almonds, per peck, 6*s*
— Coe's Gold. Drop, p. pun., 1*s*	Sweet Almonds, per lb., 2*s* 6*d*
Damsons, per half-sieve, 1*s* 6*d* to 2*s* 6*d*	Cob Nuts, per 100 lbs., 80*s* to 90*s*
Apples, Dess., per bush., 2*s* 6*d* to 5*s*	Nuts, Barcelona, 22*s*
— Kitchen, 2*s* to 4*s*	— Brazil, 16*s*
Pears, Dess., per hf.-sv., 2*s* 6*d* to 10*s*	— Cob, 14*s*

VEGETABLES.

Cabbages, per dozen, 6*d* to 1*s* 3*d*	Garlic, per lb., 4*d* to 6*d*
Cauliflowers, per doz., 2*s* to 5*s*	Onions, per bunch, 2*d* to 4*d*
Broccoli, per bundle, 6*d* to 1*s*	— large, per bushel, 2*s* to 4*s*
Sorrel, per hf.-sieve, 6*d* to 9*d*	— Spanish, per doz., 2*s* to 5*s*
Artichokes, per doz., 1*s* to 3*s*	Shallots, per lb., 4*d* to 6*d*
French Beans, p. hf.-sv., 2*s* to 2*s* 6*d*	Tomatoes, per half-sv., 2*s* 6*d* to 3*s* 6*d*
Scar. Runners, per hf.-sv., 1*s* to 1*s* 6*d*	Capsicums, Ripe, per 100, 4*s* to 8*s*
Potatoes, per ton, 50*s* to 80*s*	— Green, per 100, 1*s* to 2*s*
— cwt., 2*s* 6*d* to 4*s*	Radishes, per doz., 6*d* to 1*s* 6*d*
— bushel, 1*s* 6*d* to 2*s* 6*d*	Lettuce, per score, 6*d* to 1*s* 6*d*
— Kidney, per bsh., 2*s* to 4*s*	Celery, White, per bunch, 9*d* to 1*s* 3*d*
Turnips, per doz. bch., 1*s* 6*d* to 4*s*	— Red, per bunch, 1*s* to 1*s* 3*d*
Peas, per bushel sieve, 2*s* 6*d* to 4*s*	Endive, per score, 1*s* to 1*s* 6*d*
Red Beet, per doz., 9*d* to 1*s* 6*d*	Mushrooms, per pottle, 1*s* 6*d* to 2*s* 6*d*
Carrots, per doz. bchs., 2*s* to 6*s*	Small Salads, per punnet, 2*d* to 3*d*
Basil, per bunch, 2*d* to 3*d*	Watercress, p. 12 sm. bun. 3*d* to 6*d*
Horse Radish, per bundle, 2*s* to 6*s*	Parsley, per doz. bunches, 1*s* to 2*s*
Savory, per bunch, 2*d* to 3*d*	Tarragon, Green, per bunch, 2*d* to 3*d*
Cucumbers, Frame, each, 2*d* to 9*d*	Green Mint, per bunch, 2*d* to 3*d*
— Ridge, doz., 9*d* to 2*s* 6*d*	Marjoram, per bunch, 2*d* to 3*d*
Vegetable Marrow, per doz., 4*d* to 1*s*	Chervil, per punnet, 2*d* to 3*d*
Spinach, per sieve, 1*s* 6*d* to 2*s*	Chilis, per 100, 1*s* 6*d* to 2*s*
Leeks, per bun., 2*d* to 3*d*	

MARK-LANE, MONDAY, Sept. 23.

THE supply of Wheat from the home counties this morning was small, particularly from Essex; picked samples met a ready sale at fully last week's prices, damp and inferior descriptions sold slowly at late rates. Foreign was in more general request, and commanded our extreme quotations.—Malting Barley must be written 1*s.* lower; Grinding qualities are unaltered.—Old Beans maintain their late value.—New and all kinds of Peas are 1*s.* cheaper.—The Oat-trade is heavy, and barely supports the prices of last Monday.

BRITISH, PER IMPERIAL QUARTER.	*s.*	*s.*		*s.*	*s.*
Wheat, Essex, Kent, and Suffolk . . White	40	50	Red .	42	48

FRIDAY, Sept. 27.

The arrivals of English Corn since Monday have been moderate; those of Foreign are good. English Wheat meets a free sale at Monday's prices, and Foreign, particularly fine qualities, finds buyers for retail quantities on fully as good terms as on that day. Good Dantzig in bond, and low qualities of Red, are inquired after for exportation to France, but we did not hear of anything being done.—Barley fully maintains its late value, and there appears more disposition to purchase both Malting and Grinding qualities.—In Beans and Peas there is no alteration.—The Oat-trade is firm, and needy buyers are compelled to pay very full prices.

ARRIVALS THIS WEEK.

KINGSFORD AND LAY.

Sales by Auction.

SIX DAYS' SALE OF VALUABLE NURSERY STOCK.

MESSRS. PROTHEROE & MORRIS will submit to Public Competition, by Auction, at the American Nursery, Leytonstone, Essex (about one mile from the Railway Station, Stratford), on Monday, 21st October, 1844, and five following days, at 11 o'clock, (to close Executors' accounts), the celebrated NURSERY STOCK, consisting of the choicest kinds of Fruit and Forest Trees, fine Evergreens, Ornamental, Deciduous, and American Plants, of every variety, in considerable quantities, and lotted to suit every description of purchasers. The Stock is particularly worthy the attention of Noblemen and Gentlemen laying out their grounds, from its having many rare specimens that are only to be found in first-rate collections (also of the Trade, from its excellence), and comprising several thousands Azaleas, Rhododendrons, Ledums, Andromeda, all in fine condition for potting, being well furnished with bloom buds.

N.B. The ground is proverbial for safety of removal, the mould adhering to the roots. May be viewed prior to the Sale. Catalogues, One Shilling each, returnable to purchasers, may be had of the principal Seedsmen in London, at the Auction Mart, and of the Auctioneers Leytonstone, Essex.

NURSERY STOCK.

TO BE SOLD BY AUCTION. By MR. J. KING, on the Premises, Acre-lane, Brixton, on the 14th Oct., 1844, and following day at 11 each day, the property of Mr. Dawson; consisting of a collection of Evergreen and Deciduous Shrubs, a large stock of Fruit and Forest-trees, Camellias, and other Greenhouse Plants, &c. &c. To be viewed till the Sale; Catalogues on the Premises; Mr. CLERK, Seedsman, Bishopsgate-street; and of the Auctioneer, Hackney-road.

TO BE DISPOSED OF.—A Very Snug FARM, situate in Surrey, about 12 miles from London, comprising 200 Acres of Arable and Grass Land, in high condition; may be had at a very moderate rental, together with a neat Cottage Residence, and all necessary Farm Buildings.—For particulars apply to MESSRS. BROOKS AND GREEN, Estate Agents and Auctioneers, 28, Old Bond Street.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings at their works, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the constant supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Conservatories or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

WHEAT-SOWING.

GUANO; Genuine Peruvian, Bolivian, and Ichaboe, on Sale; also Potter's Guano, Gypsum, Sulphuric Acid, Sulphates of Iron and Copper, and all other manures. Synopsis of prices, and mode of use, on application, &c.—Apply to MARK FOTHERGILL, 40, Upper Thames-street.

GUANO (GENUINE PERUVIAN & BOLIVIAN)
ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Sept. 27, 1844.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, Sept. 27, 1844:—

Bones	p. ton	£4	10s.	0d	Nit. of Potash p. cwt.	£1	4s.	6d
" crushed,	5l. 10s. to	6	0	0	Oil of Vitriol, or Sulph. acid	p. lb.	0	0	1
" calcined		7	0	0	Rape Cakes	p. ton	4	15	0
Carbonate of ammonia	p. cwt.	2	16	0	Salts, Epsom	"	9	0	0
Guano, Peruvian,	p. tn.	10	0	0	" Glauber	"	7	0	0
" Ichaboe	"	6	0	0	Sulphate of Ammonia, per cwt.,	to	0	17	0
Gypsum	"	2	0	0					
Nitrate of Soda,	p. cwt.	0	14	9					

WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

POTTER'S GUANO MANURE is the only Guano that can positively be depended upon, and has stood the test of three seasons. The imported article, it is well known, is seldom twice alike, even when genuine, and is subject to a most extensive system of adulteration. Orders addressed early to the Works, 28, Upper Fore-street, Lambeth, will have instant attention. Testimonials will be sent per post, if required.

POTTER'S LIQUID GUANO may be had as usual of most Chemists and Seedsmen.

*** Beware of being imposed upon by inefficacious imitations.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE Attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIELD (late Mr. Mitchell), Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No. 5 A, Hawley-road, Kentish Town.

DRAINING OF LAND.

THE A LEVEL, designed for the Use of Workmen, in preserving a uniform fall in Drains and Water-courses. In consequence of the approval expressed and the demand made for these Levels at the recent Southampton Show, Mr. BAILEY DENTON has arranged with an eminent London Mathematical Instrument Maker to make them in any number required. Price 30*s*.

This Level is as accurate as a spirit-level, and so simple, that the workman unable to read can use it with facility. When closed it forms a 5-feet staff.

Orders addressed to Mr. DENTON, Land Agent, 9, Gray's Inn-square, London; or to Mr. CHARNOCK, Wakefield, Yorkshire, will insure a perfect instrument.

SEED WHEAT.

J. D. PIPER, of Colne Engaine, Essex, (Member of the Royal Agricultural Society), has been four years raising two new Stocks of Wheat, viz., Piper's "Thick-set," and "Colne Whitechaff Red." At the last Southampton Meeting two sheaves of these Wheats were exhibited outside (notice not having been given in time for their admission inside), where they produced much excitement, and 6*d*. per car was offered for them. Last year, in the same field, side by side, the Piper's Thick-set grew eight bushels and a half, and the Colne Whitechaff Red five bushels and a half more per acre than the most prolific Wheat grown in the neighbourhood. Last autumn J. D. P. measured a quarter of an acre off his field, and dibbled the Thick-set in rows a foot apart, and one bushel per acre; and though the plant was partially destroyed by the slug in the winter, and a good sprinkling of self-sown Potatoes were left to grow, still the yield was 14 bushels and a half, being equal to 14 sacks and 2 bushels per acre. One person this year grew 15 sacks and 2 bushels, another 14 sacks, and another 13 sacks per acre. One parcel weighed 64½ lbs. per bushel. This is, perhaps, the stiffest-strawed Wheat in England, and is adapted for strong or hollow bottom ground, and is not likely to get laid. J. D. P. will send to London, or to any place within ten miles of Colne, carriage free, and he will be glad to receive a post-office order, or reference to some house in London for the money, with the order for the Wheat. When it is all sold, J. D. P. promises to inform the Public, by an advertisement in this Paper; but if he should get any post-office orders after it is all sold, he will return them. The price is regulated according to the yield. Thick-set, 15*s*. per bushel; Colne Whitechaff Red, 9*s*. per bushel. Samples of the above, both threshed and in the straw, may be seen at our Office. N.B.—J. D. P. advertised in the two principal papers in Essex, where the above Wheat was growing, in order that Agriculturists might see it and judge for themselves of the quality and quantity.

TO AGRICULTURISTS.

CAMPBELL'S CORN STEEPS.—The Material for Wheat is on Sale by the undermentioned Agents, at 2*s*. 6*d*. per gallon.

Notwithstanding the extreme drought of the last spring and summer, the results of the experiments, in very many instances, have been surprising, averaging a saving on seed, in the first instance, of 3*s*. per acre, and yielding a produce of 20 per cent. additional in straw, and 40 per cent. in grain. Had the season been more moist the result would have been at least double.

From Report of the Judges, Glasgow Cattle Show, Aug. 7, 1844.

"Among the remaining articles of the Exhibition (of Roots, Seeds, &c.), the Judges would direct attention to a series of specimens exhibited by Mr. James Campbell, of Dundee, consisting of various Grasses (they were Wheat, Barley, Naked Barley, and Oats), raised from Seed steeped in a Fertilising Liquid. These were contrasted with others which had not undergone the process, and were in all cases decidedly superior."

Agents:—Messrs. G. Gibbs, 26, Down-street, Piccadilly; Thos. Gibbs, corner of Half-moon-street, Piccadilly; and Edw. Purser, 40, New Bridge-street, London. W. E. Rendle, Plymouth Manure Company; J. Campbell, 5, Mersey-street, Liverpool; P. Bruce, Merchant, Hull; Crouch and Co., 66, Close, Newcastle-on-Tyne; W. F. Karkeek, Truro; John Mayer, High Offley, Staffordshire; George Griffith, Bewdley; J. B. Haden, Warminster; Phillips and Whittem, Coventry; John Towers, Maidenhead; Samuel Waldie, Carlisle; John Rodway, Carmarthen; James Black and Co., Aberdeen; W. Campbell, Merchant, Wick; Wm. Cuthbertson, Printer, Annan; J. and D. Campbell, Thurso; Maxwell Dick, Irvine; Dickson and Turnbull, Perth; Drysdale and Co., Glasgow; Drummond and Sons, Stirling; Wm. Dalrymple, Cupar Angus; John Dykes, Kilmarnock; James Haldane, Lauder; J. Bell, Dundee; Thos. Kennedy, Dumfries; A. Kennedy, Thornhill; P. Lawson and Son, Edinburgh; Wm. Low, Forfar; A. M'Farlane, Kinross; John Ogg, and Shield and Co., Arbroath; Geo. Robertson, jun., Kirkwall; John Rae, Ellon; A. Simpson, Macduff; A. B. Telfer, Ayr; Wood and Co., Stonehaven.

EXTIRPATION of the MEALY-BUG, THRIPS, &c.—These pests to Gardens can be readily and effectually extirpated without injury to the most delicate plants, by HEREMAN'S VEGETABLE DILUTIUM, sold in bottles at 5*s*., 10*s*., and 20*s*. each, free of carriage to all parts of Great Britain.—Address, with a remittance, either to SAMUEL HEREMAN, Romsey, Hants, or Messrs. MARNOCK and MANLY, Nurserymen, &c., Hackney, who are the sole London Agents.

EXTIRPATION of all kinds of VERMIN.—Office, 69, King William-street, City, London.—Mr. J. A. MEYER, practical chymist, patronised by Her Majesty the Queen, H.R.H. the Duchess of Kent, the Royal Agricultural Society of England, and the Corporation of the City of London, and by special appointments to the principal Courts of Europe, begs to inform the nobility, gentry, merchants, agriculturists, shipowners, and the public generally, that he continues to CLEANSE, by contract, from one to five years, every description of PROPERTY, of rats, mice, moles, weasels, moths, fleas, bugs, &c., and as a guarantee of the efficacy of his preparation, respectfully refers to the certificates of his great success at Buckingham Palace and Gardens, Windsor Castle, St. James's Palace, Frogmore Lodge, Carlton Club House, Mansion House, Newgate Prison, Tavistock Hotel, Brewers, Chester, and Galley Quays and warehouses in Lower Thames-street, the property of Joseph Barber, Esq., and many others of public and private establishments, which may be seen at the office. The preparations, which are free of poison or deleterious drugs, may be had as above, in pots and bottles at 5*s*., 10*s*., 20*s*., 50*s*., and 100*s*. each, with full directions, which must be used in proportion to the extent of premises infested, to successfully eradicate the vermin, and which can be applied without injury to property. Dwelling-houses cleansed from 1*l*. to 5*l*. per annum; mansions and estates from 10*l*. and upwards; ships, docks, warehouses, granaries, breweries, farms, wharfs, &c., in proportion. Caution.—None are genuine unless bearing the signature and seal "Joseph Anton Meyer."

J. R. AND A. RANSOME, Ipswich, have published a Descriptive Catalogue, with Cuts, of their AGRICULTURAL IMPLEMENTS and MACHINES, which may be had by post, the order being accompanied by six penny stamps.

SMITH'S FIELD and GARDEN SEED-DIBBLE, or HAND-MACHINE, for depositing all kinds of Seed on the various Soils, with the greatest accuracy and despatch.—This Machine is so simple in its construction and operation as not to be liable to get out of order, and can be used by men or women. It is easily set, so as to deliver the exact quantity of seed intended to be planted, into each hole made by the Dibble, at one operation, without any further care than supplying it with Seed, by the person using it, and will plant Turnip and Mangold Wurzel Seed, Wheat, Barley, Peas, and all kind of Garden Seeds. In Tin, 1*l*. 10*s*. each; or with Copper Box and Tube, 1*l*. 15*s*. each. Commission allowed to Agents.

These Dibbles may be obtained of Messrs. COTTAM and HALLEN, 2, Winsley-st., Oxford-st., London, through the agency of the principal Agricultural Implement Sellers in the United Kingdom; or from the Inventor, by letter to his address, inclosing a Post-office order for the amount.—RICHARD SMITH, Upper Hall, near Droitwich, Worcestershire.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d*. per foot, super. A discount to the trade.

THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

TO LANDOWNERS, AGRICULTURISTS, BUILDERS, &c.

McKIBBIN'S Improved ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY.

The disadvantages attending other materials used in roofing, preventing, to a great extent many useful houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will in a great measure—and in some instances altogether—obviate them, and prove most serviceable from its lightness, durability, and impermeability to water and damp, in covering Houses, Cattle-sheds, Workshops, Ropewalks, &c., and for the sides, as well as roofs, of light structures for plants, being likewise a non-conductor of heat; besides its economy in repairs, the timber where it is used may be so light as to save its whole expense; it requires no other coping, and may be applied by any person of common ingenuity; being flexible and portable also, it is free from breakage, the expense of carriage is inconsiderable in comparison with slates, tiles, &c., and it is not liable to contraction like zinc.

Sold in sheets 32 inches by 20, at 5*d*. each (being less than 9*s*. 6*d*. per square of 100 feet), with printed directions for applying them, same as adopted at the Government Dock-yards and various other public buildings.

Orders will meet with prompt attention if addressed to H. C. BOWDEN, 18, East India Chambers, Leadenhall-street, London, or to the following agents:—Liverpool, Messrs. Grueber & Co., 11, Manesty-lane; Plymouth, Thomas Stevens, Esq.; Birmingham, William R. Loyd, Esq.; Sunderland and Newcastle-on-Tyne, Messrs. John Ritson and Sons; Hull, William Ward, Esq.; Bristol, Messrs. Moor and Hewitts; Ramsgate and Deal, Messrs. Edward Hodges & Co.; Whitehaven, William Todd, Esq.; Glasgow, Malcolm Carmichael, Esq., St. Enoch-square; Cork, Messrs. Richard Wallis & Co.; Belfast, Messrs. Grueber & Co., Dunbar's Dock; who have also on sale McKIBBIN'S improved SHEATHING, BOILER, RAILWAY, and other FELT.

*** The "IMPROVED ROOFING FELT" will be found much more durable than the Common Felt made in lengths, and not subject, like it or continuous sheets of other material, to be stripped by storm; it can also be more easily repaired, and from the simple mode of application recommended, the wet cannot percolate through nail-holes, being only fastened down at the overlaps.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and OBTAINED the PRIZE for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Buildings, Bunhill-row, London.

PORTER'S GALVANIZED CORRUGATED AND PLAIN IRON ROOFING, and IRON HURDLE and FENCE WORKS, Grove, Southwark. The Patent Galvanized Iron Co.'s Sorel's) process, is now being used for the Roofing of the New Houses of Parliament; at Woolwich Dockyard, by the Trinity Board, &c. It is particularly suited for the Colonies, and is shipped by J. PORTER to the East and West Indies, Ceylon, &c.; also supplied by him to several English, and to the Jamaica Railway Companies. Moveable Feeding Sheds and Pens, Farmyard and Fireproof Buildings of all kinds. A new description of Galvanized Iron Open Gutter covered with tile for the circulation of hot water, much cheaper than any other kind. The Trade supplied with Corrugated Plates, Galvanized or not, and with Iron Fences of all kinds.

ROYAL POLYTECHNIC INSTITUTION.—The PROTEOSCOPE, an original OPTICAL INSTRUMENT, unlimited in its appliances to Nature and Art, a highly valuable addition to LONGBOTTOM'S OPAQUE MICROSCOPE, the PHYSIOSCOPE, and the OXY-HYDROGEN MICROSCOPE. The PICTORIAL ILLUSTRATION of the PASSIONS, from COLLINS'S ODE, with Vocal and Instrumental Music, is the first subject exhibited by the PROTEOSCOPE, at a Quarter to Five o'clock in the Afternoon, and at a Quarter to Ten in the Evening. Dr. RYAN'S present Daily Lecture is on POISONS and their ANTIDOTES, delivered at Half-past Three, and on the Evenings of Mondays, Wednesdays, and Fridays, at a Quarter to Nine. Professor BACHHOFFNER Lectures on the alternate Evenings. The Lectures abound in interesting Experiments. The HYDRO-ELECTRIC MACHINE, DIVING BELL and DIVER, &c. The Music is composed and conducted by T. WALLIS, Mus. Doc.—Admission, 1s. Schools Half-price.

REAL SHEFFIELD PLATED DISH COVERS, at prices hitherto unattempted. THOMAS WEST, 18, Ludgate-street, London, having received a large supply direct from the manufactory at Sheffield, offers the best Meat Dish Covers as follow:—Cottage Pattern—1 Cover of 20 inches, 3l. 19s.; 1 do. of 18 inches, 3l. 3s.; 2 do. of 14 inches, 4l. 8s.; the set of 4, complete, 11l. 10s. ONLY. Double Dome Pattern—1 Cover of 20 in., 4l. 16s.; 1 do. of 18 inches, 3l. 19s.; 2 do. of 14 inches, 5l. 5s.; the set of 4, complete, 14l. ONLY. In noticing the prices of the above goods, T. W. ventures to assert they are superior to many advertised at a much higher price. Best Wrought Silver Spoons and Forks as usual, Fiddle Pattern, 7s. 2d. per oz.; Queen's Pattern, 7s. 4d. per oz. Superior Watches and Fine Gold Jewellery, cheaper than any house in London. West's Hand-book, with 100 engravings, and full of useful information, is just published, and may be had gratis, and post free, on application to T. WEST, Silversmith, 18, Ludgate-street, London.

HEALTH, LONG LIFE, AND HAPPINESS.—EXTRAORDINARY CURE OF SCORBUTIC HUMOUR.

I, WILLIAM WOOD, of Rockwell Green, in the parish of Wellington, Somerset, hereby certify, that for about *seven years* I was afflicted with SCORBUTIC HUMOUR on my nose, with a continued discharge, rendering me almost unfit for society; I tried several medical men, and various medicines for curing the same, but all proved of no avail, producing no beneficial effect; at last I was persuaded to try PARR'S PILLS, and after taking two small boxes and part of a third, I was completely cured, and I now feel no pain or inconvenience as before. Many parties in the neighbourhood, and your Agent for Wellington, Mr. GREEDY, can bear witness that my testimony is correct, and I wish it to be made known, that others similarly afflicted may be encouraged to try the same medicine, which under the blessing of God has proved so serviceable to me.

Witness my hand this 6th day of August, 1844. WM. WOOD.

In the presence of JOHN GREEDY, Wellington.

From Dr. C. STEANE, 184, Fulton-street, sole agent for Brooklyn.—An instance of the singular efficacy of PARR'S LIFE PILLS, which merits particular notice, occurred in the person of a lady, residing at Brooklyn, of consumptive make, who had been afflicted for upwards of six years with very great and general debility, headache, flatulence, faintings, and all the effects originating in an impaired constitution. Country air was tried, but to little advantage. She complained of weariness and pain on the least motion: her bowels were sometimes constipated, and at others lax, and never regular. At this period, she was recommended to try PARR'S LIFE PILLS, when no less astonishing than true, before she had finished two boxes, an entire and perfect cure was the result. To such, nothing can equal this antidote, as it imparts tone and strength to the stomach, and operates so mildly, that the most delicate of either sex can take them with the greatest safety.

To T. Roberts and Co., April, 1844. Yours truly, C. STEANE.

These, and hundreds of other cases of DECIDED CURES, attested on the highest authority, and already published, occupy upwards of 150 pages of letterpress. These Testimonials are published periodically, and may be had on application at any respectable medicine-vender's. The cures, in many instances, were effected after all other means had failed, and they thus establish the claims of PARR'S LIFE PILLS, in being considered the best medicine in the world.

CAUTION TO THE PUBLIC.—Beware of Spurious Imitations of the above medicine. None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE Letters on a RED GROUND, engraved in the Government Stamp pasted round each box. Sold by all respectable Medicine Venders.

IMPORTANT to the FASHIONABLE WORLD.—By far the most influential of all the graces that contribute to personal adornment is the Hair. Its recovery, preservation, and improvement proportionably concern the élégantes of our fashionable circles, and any information which will insure these desirable results will be hailed as an inestimable boon. The following extract from the letter of a respectable chemist in Bridlington will be read with the highest interest:—

"A lady, a customer of mine, has found great benefit from the use of your Balm. About six months ago her hair nearly all fell off. I recommended her to try your Balm of Columbia, which she did. In the course of a few applications the hair ceased to fall off. Before she had used one 3s. 6d. bottle it began to grow very profusely, and she has now a very beautiful head of hair. "I am, gentlemen, yours respectfully,

"WM. SMITH,

"Chemist and Druggist, Market-place, Bridlington.

"To Messrs. C. and A. Oldridge.—March 13, 1844."

C. and A. OLDRIDGE'S BALM of COLUMBIA causes the Hair to curl beautifully, frees it from scurf, and stops it from falling off, and a few bottles generally restore it again; it also prevents grayness. 3s. 6d., 6s., and 11s. per bottle. No other prices are genuine.

OLDRIDGE'S BALM, 1, Wellington-street, the second house from the Strand.

THE HORTICULTURAL MAGAZINE.—Just Published, price 1s., the introductory Number of this new periodical. Orders received by all Booksellers. Contents:—Science of Gardening—Advantage of a Garden—Annals of Horticulture—Manure and its Application—New Flowers, Fruits, and Vegetables—Landscape Gardening—Planting—Improving Estates—Grafting—Acclimatising—Irrigation—Wonderful Vegetable Productions—The Various Classes of Plants—Hybridising Plants and Vegetables—Designs for Conservatories—Gardening for Manufacturing Towns—Construction of Fountains—Substitutes for Glass—Lawns and Shrubberies—Fruit Gardens and Orchards—Geology—Soils—Horticultural Notes, &c.—T. HOULSTON, Publisher, 154, Strand, London.

CONTENTS of the NUMBER for SATURDAY last, SEPTEMBER 21, OF

THE ATHENÆUM,

JOURNAL OF ENGLISH AND FOREIGN LITERATURE, SCIENCE, AND THE FINE ARTS.

Twenty-four Large Quarto Pages, PRICE FOURPENCE,
Or Stamped, to go free by post, 5d.

The Lancet,

Of Saturday last, SEPTEMBER 21, contains:—

LECTURES on the OPERATIONS of SURGERY and on DISEASES and ACCIDENTS requiring OPERATIONS, by ROBERT LISTON, Esq. (Lecture VIII.):—
Ulcerations of the Face. Noli me tangere. Ulcerations at the Angles of the Mouth. Diseases of the Tongue. Fissure. Ranula. Tumours.

On the Use of Tincture of Iodine.

On Congenital Luxation of the Head of the Femur upon the Dorsum Ilii, by John Murray Carnochan, M.D., New York.

Carbon a Compound Body made by Plants, by J. Aldridge, M.D., Dublin.

Remarks on the London and Dublin Hospitals and Schools.

Reply of Mr. Wilkinson King to Dr. Tyler Smith.

On the Physiology of the Spinal Cord, with reference to Reflex Action, by J. C. Brereton, Esq.

Operation for a Tumour of the Neck, at Jervis-street Hospital, Dublin.

The Lancet.

Medical Agitation in the Country.—The New Fellows of the College of Surgeons.—On the Advantages of frequent Examinations during the course of a Medical Curriculum.—Trusses in Poor-Law Unions.—Mr. Pittock's Case of Dislocation of the Head with Fracture of the Neck of the Humerus.—The Royal Free Hospital and Dr. Costello.

MEETINGS OF THE MEDICAL PROFESSION:—Berkshire; Leeds; Stourbridge; Liverpool; Tunbridge; Hereford; Birmingham; Kidderminster; Ipswich.

Medical Protection Assembly.—Birmingham General Hospital.—Apothecaries' Hall.—Correspondents.

London: JOHN CHURCHILL, Princes-street, Soho; and may be had of all Booksellers and Newsmen.

NEW WORK ON AGRICULTURAL CHEMISTRY.

This day is published, in post 8vo., 7s. 6d. cloth.

LECTURES TO FARMERS ON AGRICULTURAL CHEMISTRY. By ALEXANDER PETZHOLDT.

TAYLOR AND WALTON, 28, Upper Gower Street.

PROFESSOR LIEBIG'S NEW WORK.

Now ready, fcap. 8vo., 5s. cloth,

FAMILIAR LETTERS ON CHEMISTRY.—*Second Series.*—The PHILOSOPHICAL PRINCIPLES AND GENERAL LAWS OF THE SCIENCE. By JUSTUS LIEBIG, M.D., Professor of Chemistry in the University of Giessen. Edited, from the *Lancet*, by JOHN GARDNER, M.D.

TAYLOR AND WALTON, 28, Upper Gower Street.

THIS DAY.

I.

THE BOOK OF THE FARM. By HENRY STEPHENS. Parts XX. and XXI., concluding the Work. Price 8s.

CONTENTS.

Sowing Autumn Wheat—Rotation of Crops—Fertilising the Soil by means of Manures—Experiments—Destroying Vermin—Looking at a Farm; its Rent; its Lease; its Stocking; Capital required for it—Improving Waste Land—Farm Book-keeping—Cottages of Farm Servants—Preservation of Implements—Index—Classified List of Illustrations—with 64 Engravings on Wood.

II.

THE QUARTERLY JOURNAL OF AGRICULTURE, and the TRANSACTIONS of the HIGHLAND and AGRICULTURAL SOCIETY of SCOTLAND. New Series. Part VI. With Coloured Map and Sections illustrating the Geology of Dumfriesshire. Price 3s.

WILLIAM BLACKWOOD and SONS, Edinburgh and London. Sold by all Booksellers.

SHELL COLLECTING.

Just published, fcp. 8vo., 10s. 6d. cloth,

POPULAR CONCHOLOGY; or, the Shell Cabinet arranged; being an Introduction to the Modern System of Conchology, with a Sketch of the Natural History of the Animals, an Account of the Formation of the Shells, and a complete Descriptive List of the Families and Genera. By AGNES CATLOW. Illustrated with 312 Woodcuts.

"This little volume should accompany every family sojourning at the sea-side; the beach would then possess attractions now known but to the scientific few."—*Spectator.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

NEW WORK BY PROFESSOR LOW.

Early in October will be published, in 1 vol. 8vo.

ON LANDED PROPERTY, and the Economy of Estates: comprehending the relation of Landlord and Tenant, and the Principles and Forms of Leases; Farm-Buildings, Enclosures, Drains, Embankments, Roads, and other Rural Works; Minerals; and Woods. By DAVID LOW, Esq., F.R.S.E., Professor of Agriculture in the University of Edinburgh, &c.

By the same Author,

ELEMENTS OF PRACTICAL AGRICULTURE. 4th Edition. 8vo. 21s.

THE BREEDS of the DOMESTICATED ANIMALS of Great Britain. 2 vols. 4to. with 56 coloured Plates, 16l. 16s.

AN ENQUIRY into the NATURE of the SIMPLE BODIES of CHEMISTRY. 8vo. 6s.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Printed by WILLIAM BRADBURY, of No. 6, York-place, Stoke Newington, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, September 28, 1844.

The Newspaper.

SATURDAY, SEPTEMBER 28, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—*Trustees.*—Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

LIFE ASSURANCE AND ENDOWMENT.—The following are specimens of the Premiums charged by the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY, for the Assurance of a payment of £100 to the Assured on the attainment of the age of 60, or for the payment of that sum to his Representatives, in case of his death before that age:—

Age	20	25	30	35	40	45
Ann. Pr.	1*l* 17 10	2*l* 5 8	2*l* 16 6	3*l* 11 3	4*l* 14 0	6*l* 13 1

Persons assured to the amount of £500 participate in the profits of the Company.—Subscribed Capital £200,000.

For Forms of Proposal, and other particulars, apply at the Offices, 126, Bishopsgate Street, corner of Cornhill, City.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY. 14, WATERLOO PLACE, LONDON.

The Chisholm, *Chairman.* W. Morley, Esq., *Deputy Chairman.*

PECULIAR ADVANTAGES OFFERED TO POLICY-HOLDERS IN THIS INSTITUTION.

An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying up the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.

Extract from the Reduced Scale of Rates, for an Assurance of 100*l*., for One Year, Seven Years, and the whole Term of Life.

AGE	ANNUAL PREMIUM. ONE YEAR.	SEVEN YEARS.	WHOLE LIFE.
	£ s. d.	£ s. d.	£ s. d.
20	1 0 9	1 1 6	1 13 11
30	1 2 9	1 3 3	2 2 1
40	1 5 6	1 7 6	2 16 4
50	1 15 9	2 1 6	4 1 11
60	3 3 5	3 17 0	6 8 3

Full particulars are detailed in the Prospectus.

A. R. IRVINE, Managing Director.

NORTH BRITISH INSURANCE COMPANY, Established 1809. His Grace the Duke of Sutherland, K.G., President; Sir Peter Laurie, Alderman, Chairman of the London Board; Francis Warden, Esq. (Director H.E.I.C.), Vice Chairman; John Webster, M.D., F.R.S., 24, Brook-street, Physician.

THIRD DIVISION OF PROFITS.

The Third Septennial Investigation of the Company's Affairs will take place on the 31st December next. Parties joining the Profit Scheme in the interim, will participate in the Bonus to be then declared.

This Institution is incorporated by Royal Charter, and is so constituted as to afford the Benefits of Life Assurance in their fullest extent to Policy Holders, combined with perfect security, in a fully subscribed Capital of One Million Sterling, besides an Accumulated Premium Fund, exceeding Four Hundred Thousand Pounds, and an Annual Revenue of Eighty-seven Thousand Pounds.

Fire Insurances may be effected on Private Houses, Country Mansions, &c., at the lowest rate of Premium.

A Prospectus, containing Tables of Premiums, with the names of the President, Vice Presidents, Directors, and Managers, who are all responsible Partners, may be obtained of Messrs. B. and M. BOYD, 4, New Bank Buildings, or of the Actuary, 10, Pall Mall East.

JOHN KING, Actuary.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronised by "Her MAJESTY," H.R.H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tatar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the enamel, substituting for discolour and the aspect of impurity, the most pure and pearl-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2*s*. 9*d*. per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus,—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each Box. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

FIDDLE and PRINCE ALBERT'S PATTERN PLATE.—A. B. SAVORY and SONS, Manufacturing Silversmiths, No. 14, Cornhill, opposite the Bank of England.—The best wrought SILVER SPOONS and FORKS, fiddle-pattern, 7*s*.6*d*. per ounce; the Prince Albert's pattern, 7*s*. 6*d*. per ounce. The articles may be had, lighter or heavier, at the same price per ounce:—

Messrs. SAVORY and SONS recommend the Prince Albert's pattern; it is very novel, and of unexampled beauty.

HORTICULTURAL BUILDING & HEATING by HOT WATER.

J. WEEKS & R. DAY, ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

IT is most important to the nervous to be assured, on the authority of noblemen, physicians, surgeons, clergymen, &c., that this is the only rational method, and truly honest or successful effort in the world to CURE NERVOUS or MIND COMPLAINTS. All others are known frauds. This effort is from benevolence rather than gain. Above 30 physicians, &c., convinced that no pills, powders, or draughts ever did or can cure mind complaints, have placed themselves, their relations, and patients under Rev. Dr. WILLIS MOSELEY'S new and peculiar treatment, and from having been cured themselves add their testimony to that of a thousand others in pronouncing this to be the only cure in the world for mind or nervous complaints, including depression, debility, blood to the head, giddiness, blushing, groundless fears, loss of memory and aptitude for study and business, restlessness, irresolution, sleeplessness, wretchedness, confusion, delusions, indecision, melanchoiy, thoughts of self-destruction, &c., insanity, &c. Testimonials and references at 9, Charlotte-street, Bloomsbury. At home from 11 to 3. Apply, or write, free. Means of cure can be sent to all parts, and assistants in bad cases to carry out the plan of cure.

RABBIT NETS, SHEEP NETS, FISHING NETS, CAPES, &c.—Long Hare and Rabbit Nets, on Cords, 50, 80, and 100 yards long, for catching Rabbits, and going round coverts in shooting. Net to effectually exclude wasps and flies from ripe fruit, and protect the blossoms in the early part of the year, 7½*d*. per yard. Strong Sheep-folding Net, 4½*d*. per yard, nearly 4 feet high. Net to act as fences against rabbits, poultry, &c., 2*d*. per yard. Fishing Nets of all kinds from 4 to 400 yards long, Nets to inclose fowls and pheasants, 2*d*. per yard. Travelling wrappers, 6*s*. each, for the knees and legs; ditto, covered with waterproof, 7*s*. 6*d*. Agent for the Westmoreland Horse Clothing and Blanket Company. A saving of one-third in these articles. Tarpawling Coats and Capes for watchers, keepers, &c., 7*s*.; Capes, 8*s*. 6*d*.; Coats, Coach and Dog-cart Aprons, 12*s*. each, lined and strapped. Garden Frame Covers (tarpawling), 9 feet and 4 feet, 3*s*. each. Waggon Covers, Roofing, Tarpawlings, &c. ROBERT RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New Road, London. N.B.—2000 second-hand Police Capes for sale, 2*s*. and 2*s*. 6*d*. each, for labourers and farm servants.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

News of the Week.

THE terms of the treaty between France and Morocco are still the subject of angry controversy in Paris, and the Opposition papers attribute them to the anxiety of the Cabinet to gratify the wishes of the British Government, and to enable Louis-Philippe to visit England. It appears, from the details given by the Ministerial papers, that the Emperor of Morocco engages not to assemble more than 2000 men on the eastern frontier, unless by common accord; that the chiefs who have violated the peace by invading the French territory are to be punished; and that Abd-el-Kader is outlawed throughout the Moorish and French possessions, and is to be pursued by the troops of both Governments until he shall have been expelled or captured. The frontiers of the two Empires are to remain the same as at the period of the Turkish rule in Algeria: and the isle of Mogadore and the town of Ouchda are to be evacuated by the French. The King has marked his satisfaction at the conduct of the Prince de Joinville and Marshal Bugeaud, during the late operations, by promoting his Royal Highness to the rank of Vice-Admiral, and by conferring on the Marshal the title of Duke of Isly. The now celebrated letters published in the *Times* and quoted in our columns at the time of the bombardment of Tangiers, are still prominently before the public. Captain Wallis, Commander of the Warspite, has expressed his regret to the French Consul at Gibraltar that such documents were written by any of his officers, and in consequence of a public inquiry, instituted at the command of the Admiralty, the chaplain of the ship has acknowledged that he was the writer of the first letter, and has been severely reprimanded by the Commander-in-Chief. The other officers of the Warspite have resisted the inquiry, and refused to discover the authors of the remaining letters. The accounts from Tahiti are very unsatisfactory. The French troops and the natives have had several collisions, in which the troops were victorious, but with a loss of life which made their victories dearly earned. The Opposition papers attribute the hostility of the natives to the French settlement entirely to the intrigues of Great Britain; but at the same time admit that France would do well at once to abandon the protectorate. His Majesty Louis-Philippe left Paris on Wednesday for the Château d'Eu, preparatory to his departure for England. The squadron, under Admiral La Susse, which is to escort His Majesty to Portsmouth, is ordered to assemble at Treport on Friday, the 5th October; but His Majesty is not expected to embark till the evening of the 7th.—The accounts from Spain, though brief and unconnected, are full of ominous predictions which again threaten the tranquillity of that unhappy country. The province of Navarre has returned in all its elections deputies hostile to the Government, and this is said to be only the precursor of a great Carlist movement, which will probably break out before the end of the year. The expedition is said to be under the control of the famous Carlist General Balmaceda, and between 400 and 500 Carlist leaders are supposed to be hid at this moment in different localities along the frontier. Don Carlos, however, is said to be anxious to avoid any act of violence for the present, believing that the succession question may yet be adjusted by a marriage between his son and Queen Isabella.

At home the proceedings in Dublin are of more than their usual interest. They include the banquet given to Mr. O'Connell and his fellow-prisoners by the citizens of Dublin, the meeting of the Repeal Association, and the motion of Dr. Maunsell in the Corporation, for an Address to the Queen, praying that the Court and Parliament may be held at least once in every three years in the city of Dublin. Mr. O'Connell has announced the abandonment of the proposed Clontarf meeting, on the ground that it is not necessary for the vindication of their rights, and his willinguess to surrender his position as a leader to Mr. Grey Porter, if that gentleman will take his place and carry out his plans for a Federal Parliament. Dr. Maunsell's motion fell to the ground for want of a seconder, but it was received with general applause, and was complimented by Mr. O'Connell, with an expression of his regret that he could not support it. The speech of Dr. Maunsell, who is both a Conservative and a Protestant, and the tone and temper of the meeting at large, are worthy of attentive consideration. If they do not indicate a modified state of feeling among the two antagonist parties, they at least show a desire to meet upon some common ground, and confirm the unanimous impression that some important change is close at hand.

Home News.

HER MAJESTY'S VISIT TO SCOTLAND.—The Prince did not go out deer-stalking on Tuesday as was anticipated. In company with Lord Glenlyon, his Royal Highness proceeded to the hills of Bruar, where, in the short space of fifty-five minutes, he brought down seven brace of grouse. A heavy shower of rain came on at one o'clock and continued to fall in torrents for upwards of two hours. This compelled Her Majesty to defer her drive until a late hour in the afternoon, and Prince Albert was also obliged to retreat from the moors above Bruar. The rain ceased about half-past three, when Her Majesty and the Prince, accompanied by Lord Glenlyon, Lady Canning, and Lady C. Cocks, drove off for the Falls of Tummel. The Royal party left the Castle in two carriages and four, preceded by outriders, and on passing by Killiecrankie Her Majesty ordered the postilions to stop, and stood up in the carriage to look through a gap, which has lately been made by Mr. Butter of Fascally. One of the most beautiful views in this neighbourhood had long been hidden by the rich foliage which fringes the banks of the Garry; but, by the judicious removal of a few trees and shrubs, the traveller is now enabled to pause on the brow of the hill, and see the Garry glittering in the sun, and the whole of the precipitous defile through which General Mackay passed with his troops before Claverhouse fell upon him with his Highlanders. As on the previous occasion when visiting the Pass Her Majesty addressed several questions to an old Highlander, named William Macdonald, who haunts this neighbourhood. The old man is exceedingly proud at having been selected by Her Majesty to point out the beauties of his native land, and dilates with enthusiasm on being thus honoured by the Queen. The postilions were then ordered to drive on along the high road to Perth, and, on arriving at the bridle road, which leads to the Falls of the Tummel, Her Majesty alighted, and proceeded on foot to view the Fall. Her Majesty walked at a rapid pace along this road, which is nearly a mile in length, and was not, as may be supposed, in a fit state for ladies, on account of the heavy rains which had lately fallen. Her Majesty, however, heeded neither the mud nor the loose gravel, but walked leaning on the arm of Prince Albert, Lord Glenlyon acting as cicerone. On

arriving at the confluence of the two rivers, where the Tummel first falls over the rocks into the Garry, Her Majesty was extremely pleased with the meeting of the waters. The view at this spot is singularly beautiful, and not being within the beaten track of tourists is seldom visited. The Fall was increased in magnificence by the immense body of water which came rushing down in torrents from the mountain streams. After having passed three quarters of an hour in viewing the beauties of this spot and the immediate neighbourhood, Her Majesty walked back to the carriages and returned to the Castle. On Wednesday Her Majesty rose early and took her usual morning walk in the grounds, accompanied by the Prince and the Princess Royal. At eleven o'clock, Her Majesty and the Prince, attended by two servants with led ponies, left the Castle on foot, and, unattended by any of their suite, forded the Garry and proceeded to climb the hill of Tulloch, which overhangs the back of the Castle. Her Majesty succeeded in attaining the summit of the rocky mountain, a work of much labour, as some parts of the hill are almost perpendicular. Her Majesty and the Prince in their descent mounted their ponies at the foot of the hill, and cantered back to the Castle at 12 o'clock. On returning from their mountain ramble, Her Majesty and the Prince partook of a luncheon, and in the afternoon drove out in the neighbourhood in a carriage and four, preceded by outriders. During the afternoon Her Majesty accompanied the Prince into the park, where His Royal Highness shot a fine buck. The carriages were ordered at three, to convey the Royal party up the Vale of Glen Tilt. Her Majesty there had an opportunity of seeing the remote solitudes and magnificence of Highland scenery in all its wildness. The Prince, who was on horseback, preceded Her Majesty, with a small cavalcade, consisting of his noble host and some of the gentlemen of the Royal suite. The foresters had been out during the morning, and the red deer were seen in countless myriads pouring over the craggy precipices, roaming unrestrained through these rocky fastnesses as Her Majesty drove through the glen. On Thursday morning the Princess Royal, accompanied by Mdlle. Charrier, her governess, rode out in the grounds. The Prince shot another stag in the Home Park, not so large as that on Wednesday, but still a splendid animal. The Royal party afterwards walked out in the grounds. The Marquess of Breadalbane arrived in the course of the day from Taymouth, by invitation from the Queen. The Hon. Fox Maule and lady also passed through Blair, and left their cards at the Castle. The jeweller to Her Majesty also arrived from London. About four o'clock, Her Majesty, accompanied in the carriage by the ladies of her suite, and by the Prince and Lord Glenlyon on horseback, drove up for about three miles, where, sheltered by the woods which there appear to fill up the valley, they could have a view of the deer that the foresters had been out in the course of the day driving in that direction. They had not to wait long. In the course of a quarter of an hour a troop of about fifty of these graceful animals appeared on the very ridge of the hill, peering down into the valley below. The sight was the most beautiful that could well be conceived. Their forms were brought out in distinct relief against the sky above the sharp, clear, and well-defined outline of the hill-top; and every movement could be discerned even by the naked eye, as these graceful creatures tossed their antlered heads, and appeared to snuff the gale. Now they moved in a compact mass slowly down the hill, when their forms became indistinct and blended with the heathy slopes; but presently they turned again, crested the hill, and then moving for some time along the ridge, they again disappeared on the opposite side. In about half an hour, a troop, increased to between 200 and 300, again appeared, and again every eye was fixed upon their motions. It seemed to be the object of the drivers to keep them on the crest of the hill, where their outlines could be most distinctly seen, so that for a considerable time the herd were seen to move almost in single file along the top in one direction; then a portion of them stopped and turned back; and lastly the whole herd bounded back again, though not apparently alarmed, and finally disappeared. Of the whole herd three only were now left, and men were observed gaining the wind of them from various points of the hill, as if deer-stalking; but no attempt was made to shoot them, as it was understood that the object was merely to show Her Majesty the deer in their wild state—an object in which they completely succeeded. Her Majesty did not return to the Castle until nearly 7 o'clock. Lord Breadalbane dined with Her Majesty in the evening. On Friday morning the Queen rode out on a pony for three hours shortly after breakfast, and returned to the Castle at 12 o'clock. The carriages were ordered to be in readiness at 3 o'clock to convey Her Majesty again to Glen Tilt. Her Majesty was so struck with the magnificence of the scene on Thursday, that she expressed a desire to penetrate still farther into the Glen, on the road towards Braemar, the forest of which is now leased to the Duke of Leeds. Her Majesty was driven in the pony phaeton by Prince Albert; Lord Glenlyon, Sir E. Bowater, Lord C. Wellesley, the Marquis of Breadalbane, Lady Glenlyon, and Lady Canning being also of the party. Lord Glenlyon's phaeton followed the cavalcade, which proceeded at a rapid rate towards the last forest lodge, and then went on two miles beyond the lodge, which is eight miles distant from the Castle. Her Majesty and the Prince both expressed themselves delighted with the beautiful diversity of the scenery. The Royal party did not return till 6 o'clock. On Saturday Her Majesty, according to her invariable custom since her residence at Blair Athol, rose at 7 o'clock, and shortly afterwards was seen taking her morning walk in company with Prince Albert and the Princess Royal. The Princess gambols about the grounds in great glee with her young playmate, the Master of Glenlyon, a beautiful little boy, with fine silken hair, attired in the Highland costume. Her Majesty took a ride after breakfast, and after luncheon proceeded with Prince Albert to take another drive up Glen Tilt, where preparations had been made for his Royal Highness to go deer-stalking. Her Majesty was exceedingly anxious, if possible, to witness the sport, and her Majesty's pony had been sent on before with one of Lord Glenlyon's gillies, in order that she might alight from her carriage, and ascend the rocky brow of the hill, where a more favourable opportunity might be obtained of seeing the herds of deer. Lady Glenlyon had preceded Her Majesty up the Glen, and the Queen was accompanied by Prince Albert, Lady Canning, Lord Glenlyon, Lord C. Wellesley, and Sir E. Bowater. On arriving at Lochlass, which is a considerable distance up the Glen, Her Majesty and Prince Albert mounted the gray ponies, and climbed along the rugged and precipitous sheep-walks which lead to the summit of Cairnchlamman, or the Hill of Gleds, so called from its being the favourite resort of hawks, which are called "gleds" in this part of the country. The wind unfortunately was not favourable for deer-stalking, and not one animal was shot, but Her Majesty and the Prince succeeded in attaining the loftiest point of Cairnchlamman, upwards of 2000 feet high, and, perched on this dizzy eminence obtained a magnificent view of the vast domains which belong to the house of Athol. In ascending these rocky mountains, nothing appears to daunt Her Majesty, and the gilly who leads the pony often pauses, and looks along the craggy precipice, as if fearful to conduct his precious charge into the midst of such dangers; but Her Majesty orders him always to go on, and keeps her seat with the same composure as if she were cantering down the long walk in Windsor Park. It is said that Her Majesty has even expressed her intention of ascending the barren mountain Ben-y-Gloe, a feat which but few persons in the neighbourhood have ever accomplished. The Marquis of Breadalbane left the Castle for Taymouth at half-past six, A.M., and Sir James Clark also left for Dunkeld.—On Sunday Her Majesty and Prince Albert, accompanied by Lord and Lady Glenlyon and the suite, attended divine service in the parish church. The building, which accommodates between 500 and 600 persons, was crowded to excess, a large number of strangers being present, not only from the surrounding parishes, but also from Dunkeld, Perth, Dundee, Glasgow, and other towns. All sorts of vehicles, coaches, phaetons, gigs, and dog-carts, were in requisition, and kept pouring in their occupants from an early hour in the morning; the result of which was that large numbers were disappointed of admission. Her Majesty arrived shortly after 12, escorted by her Highland Guard, and took her seat in the Royal pew. The anxiety to see Her Majesty was very great, so great as to overstep church decorum, the people, especially in the galleries, often rising from their seats to get a view, and staring at the Queen and the Prince with unseemly pertinacity, notwithstanding the hushing murmurs of the gentry of the neighbourhood. Lady Canning, Lady Glenyon, Lady C. Cocks, and Lord Glenlyon, attired in his Highland dress, occupied the front seats of the pew. In the back seats were Lord Aberdeen, Lord Liverpool, Lord C. Wellesley, Sir E. Bowater, and Sir J. Clark. Her Majesty wore a black silk dress, with a shepherd's plaid thrown over her shoulders, and a white crape bonnet. Before the minister entered the pulpit, Mr. Peacock, the precentor, published the banns of marriage for the first, second and third times of asking, between Mr. Irvine, the minister of the church, who preached on the previous Sunday, and one of his fair parishioners. After this matrimonial proclamation, divine service was commenced by the Rev. Dr. M'Leod, one of Her Majesty's Chaplains for Scotland, and minister of St. Columba, at Glasgow, where the service is performed in Gaelic, for the accommodation of the vast number of Highlanders who throng the streets of that commercial city. Dr. M'Leod attended at the request of Mr. Irvine, who did not wish to make his public appearance in the pulpit immediately after the announcement of his intended marriage. After the usual service according to the Presbyterian form of worship, Dr. M'Leod preached an excellent sermon from the 11th to the 14th verses of the 2d chapter of Titus. The sermon was delivered in a broad Scotch accent, and was a favourable specimen of the style of preaching which at present prevails in the Scottish Presbyterian Church. It contained a defence of the cardinal doctrine of Calvinistic Christianity, viz., the inseparable union between God's free grace and man's restitude of life. Dr. M'Leod, like his predecessor, had the good taste to abstain from any allusion to the presence of Her Majesty among the congregation. The concluding prayer was delivered with an earnestness which came home to every member of the congregation, and a distinctly audible Amen was heard from every corner of the church when Dr. M'Leod prayed with heartfelt fervour that Her Majesty the Queen Victoria might long wear her crown, and that she might yet see many happy days, and that at the last, when she left her earthly throne, she might ascend a throne of imperishable glory. The service concluded as before with a benediction, after which Her Majesty, with Prince Albert, the noble host and hostess, and the suite, returned to the Castle. Her Majesty and the Prince did not leave the precincts of the Castle during the day: Her Majesty walked in the grounds in the afternoon with Prince Albert to the Falls of the Fender. In the evening Dr. M'Leod had the honour of dining with Her Majesty. On Monday Her Majesty's movements were again confined to the grounds. In company with Lord Glenlyon, the Queen on her sure-footed Highland pony ascended a hill beside the Castle, that she might have an opportunity of witnessing the grouse-shooting of Prince Albert. In a short time His Royal Highness brought down six brace, after which the royal party returned to the Castle. In the morning the Prince shot another stag; he finished it with two bullets, the first not having completed the work. Lord Glenlyon also took three shots at it, but missed with all. On Tuesday, Her Majesty again proceeded to Glen Tilt, as Lord Glenlyon, at an early hour in the morning, had gone down to the Castle to inform the Prince that the weather would be favourable for deer-stalking. Her Majesty being desirous to witness the sport, resolved to accompany the Prince, and shortly after breakfast the cavalcade left the Castle and went through the Glen up to the Forester's Lodge. Her Majesty alighted at the Lodge, and remained there for some hours, whilst the Prince and Lord Glenlyon issued forth on their expedition. The Prince was, however, unfortunately, unsuccessful, and was compelled to return after a blank day. Her Majesty continues in the enjoyment of excellent health, and has derived considerable benefit from the fresh air, and absence of restraint and ceremony. The Highland guard are continually on duty—day and night—in detachments of twenty, which relieve each other every two hours. The sentinels at the principal gate allow no one to pass who has not a written order from Lord Glenlyon. On Saturday his lordship's brother, the Hon. Captain Murray, was refused admittance, on the ground that he had not such an order. A sturdy Highlander on guard insisted on the usual pass, and that not being forthcoming, Captain Murray was told that he could not be admitted, upon which he at once retired, saying that he should tell his brother how well the guard did their duty. It is expected that Her Majesty will leave Blair Athol on Tuesday next, the 1st October, as Her Majesty will be thus enabled to reach Windsor before the arrival of King Louis-Philippe on the 6th inst. There is now no doubt that Her Majesty, Prince Albert, and a portion of the infant Royal family, will pay a visit to the Isle of Wight during the autumn. Osborne House is in course of preparation for the reception of the Court, which is expected to arrive there immediately after the departure of the King of the French.

THE ROYAL FAMILY.—The Duke of Cambridge and his son-in-law, the Grand Duke of Mecklenburgh Strelitz, are making a tour in Scotland, and have been on visits to Drumlanrig Castle, Hamilton Palace, Scone Palace, and Inverary, during the week. His Royal Highness passed through Glasgow on Monday. Their Royal Highnesses the Prince of Wales, the Princess Alice, and Prince Alfred, will leave the Pavilion at Brighton for Windsor Castle on Monday or Tuesday next; Her Majesty, it is stated, having abandoned the intention of visiting Brighton in the Royal yacht previously to her return to Windsor.

Order of the Garter.—It is understood that a Chapter of the Garter will be held at Windsor on Friday week, for the election of two knights. The summonses from the office of the King-at-Arms, for the knights to attend in their robes on the above day, were delivered at their town residences on Monday. The King of the French, it is expected, will, as a European Sovereign, be elected an honorary knight of the Order during his sojourn in this country.

Parliamentary Movements.—Mr. Talbot Clifton was elected Member for North Lancashire on Friday, without opposition.

Foreign.

FRANCE.—The controversy respecting the conclusion of peace with Morocco is kept up with great acrimony by the Opposition prints, and the Ministerial papers scarcely turn their attention to any other topics. The former still maintain that a pecuniary compensation for the expenses of the war might easily have been obtained; that the bombardments of Tangiers and Mogadore, and the rout of his army at Isly, had terrified the Emperor into complete submission; but that the Ministry were so anxious to gratify the wishes of our Government, and to enable Louis-Philippe to proceed to England, that they were even more eager for peace than Abd-er-Rhaman. The *Constitutionnel* affirms that the convention was not even signed on board the Suffren, as might have been inferred from the telegraphic despatch announcing the event, but that the French negotiators landed at Tangiers, and obsequiously waited on the Pacha, Sidi-Bousslam, at his casbah. On beholding such a show of courtesy, the Moors recovered from their consternation, and the result was an arrangement whereby the person of Abd-el-Kader is not even secured. Abundant sarcasms are lavished on this diplomatic achievement; a tent, a parasol, and the duchy of Isly, are reckoned the sole profits of the campaign, and M. Guizot is exhorted to get himself made "Duke of Mogadore." It adds that M. Guizot will have great difficulty in defending the treaty, even in the opinion of his friends. The official *Moniteur* announces the promotion of the Prince de Joinville to the rank of Vice-Admiral, and intimates that this proof of the royal favour should be regarded as only the first testimony of His Majesty's satisfaction at the conduct of the Prince and all under his command in the recent operations on the coast of Morocco. The *Moniteur* adds, that

rewards and distinctions will be accorded to all who distinguished themselves in the expedition. The King, by an ordinance of the 18th inst., conferred on Marshal Bugeaud, Governor-General of the French possessions in Algeria, the title of "Duke of Isly," and in the great national Museum at Versailles, two compartments, which are yet empty, but which M. Horace Vernet has been deputed to fill, have already inscribed over them the words "Isly," "Tangier," "Mogador." The following is a summary of the treaty of peace concluded between France and Morocco, as published in the *Débats:* "The most important clause is that which regards Abd-el-Kader. The Emir is outlawed. The Moors, consequently, undertake to pursue him, with arms in their hands, throughout their territory, until he shall have either been expelled the territory or they shall have laid hold of his person. If the Emir fall into their hands, they engage to confine him in one of the towns situate on the western coast of the empire, until the two Governments shall have come to an understanding to take measures to guarantee the tranquillity of Algeria against his attacks. This is the essential article of the treaty. Another article stipulates that an exemplary chastisement shall be inflicted on the Moorish chiefs who have violated the peace and invaded our territory. The Emperor engages to prevent for the future any assemblage of troops on our frontier, and not to retain more than 2000 men under the command of the Caid of Ouchda, the nearest town to our frontiers, and which we occupied after the battle of Isly. The frontiers are to be marked out as they were during the domination of the Turks in Algeria. This question of frontier was, it may be recollected, the origin or the pretext for the attack of the Moors. The treaty acknowledges our rights, and decides in our favour. Fresh negotiations will take place for the purpose of completing and consolidating the ancient treaties which regulate our political and commercial relations with Morocco. In the meantime these ancient treaties are maintained, and France will enjoy, in every respect, the same privileges as the most favoured nation."—The famous letters published by the *Times*, and with which our readers are familiar, have not yet ceased to excite attention. The official journals state that "M. Eugene Bero, Consul of the King at Gibraltar, has informed the Minister for Foreign Affairs, that Capt. Wallis, commander of the English frigate Warspite, repaired on the 6th to his office, accompanied by an officer of artillery of the English garrison of Gibraltar. The object of their visit was to protest officially against the letters, published in the *Times*, by persons alleged to have been officers of the Warspite. Capt. Wallis, moreover, signed a written protest, which was to have appeared the same evening in the *Gibraltar Chronicle*, and an inquiry had been instituted on board the Warspite by order of the British Government, to discover the writers of the letters published by the *Times*." This account is confirmed by the *Times* of Thursday, which states that the writer of the first of the three letters which found their way into its columns last month from the Warspite, in Tangier Bay, has, in consequence of the "inquiries," discovered himself to the "authorities," and been "severely reprimanded" accordingly by the Admiral in command at Gibraltar. This gentleman turns out to be the chaplain of the ship. The *Times* says upon this point:—"On what pretence, or on what conceivable principle, this gentleman has been 'severely reprimanded' by the Admiral of the station, or any other Admiral, merely for expressing his own private opinion about the manœuvreing of a couple of French line-of-battle ships, of which he happened to be an unconcerned spectator, we are really at a loss to conceive. We should have thought that the Bishop, if any one, was the authority to which this gentleman was responsible for his opinions; and to have an Admiral catechising the chaplains of his fleet with a view to limiting their freedom of speech and opinion about things indifferent, certainly appears to us pretty nearly as great an incongruity as would be exhibited by that well-known naval wonder, the service of the horse marines. The *lay* officers of the Warspite, we are told, have resisted this most inquisitorial and unEnglish intrusion upon the free exercise of their hitherto undoubted right of speech and opinion, and have refused to discover the authors of the remaining two letters. We are heartily glad of it. A plainer case of tyranny—of vexatious, truckling, and most unprofitable tyranny—could not occur; and there can be no breach of discipline involved in resisting or rather baffling it."—We learn from the Toulon journals that very great preparations are making in that town to give a brilliant reception to the Prince de Joinville. It is said that deputations from several departments will arrive at Toulon on this occasion.—It is said that the Lord Mayor and Aldermen of London have written to Louis-Philippe a very respectful letter, requesting of him to accept an entertainment from the city of London. The King has shown himself much gratified with this attention, but has at the same time declined the invitation of the London corporation, pleading his health as the ground of his excuse. What appears really to have decided his Majesty against going to London is the desire to avoid too public a reception. His Majesty wishes that, in present circumstances, his journey to England should preserve the simple character of a visit from one Sovereign to another.—An absurd story published in the *Morning Herald* respecting an alleged treaty which would secure to England the possession of the port of Suez and other advantages in Egypt, has been much canvassed in Paris. The *Débats* and other Ministerial papers from the first disbelieved the account, and it now turns out that no such treaty was ever thought of, and the British Cabinet have denied all knowledge of such a transaction.—The papers publish the following account from Tahiti:—"The Government have received accounts from the island of Tahiti, dated the 24th April, which state, that after having vainly endeavoured to reduce to obedience the rebels who had attacked us at Taravau, the Governor, M. Bruat, proceeded to engage them at Mahahana, where they had raised entrenchments, which were defended by 1000 armed men, with three pieces of cannon. On the 17th, the Governor, M. Bruat, landed with 441 men of all arms. The redoubts were carried by the bayonet. The rebels had 102 men killed; their colours were captured, and their cannon spiked. On the following day we destroyed their works, and carried off their arms and ammunition. On our side we have to deplore the loss of two officers killed, M. de Nansouty, lieutenant in the navy; and M. Siegnette, an officer of artillery. We had, moreover, 52 privates wounded." Upon this announcement the Ministerial journals make no observation. The Opposition papers, however, make use of it in order to revive all their virulence towards the French Government and the English nation. The *Journal de Paris*, however, thinks that France ought to abandon the protectorate of Tahiti as not worth having, an opinion in which it is joined by the *Constitutionnel* and the *Revue de Paris*.—Few subjects have caused more speculation than the rumoured visit of Lord Palmerston to Paris. The Opposition papers announce his arrival as a great event, and the *Siècle* says—"An Englishman comes to Paris in this season to enjoy the autumn sun, to visit the environs before the leaves fall, or to attend the opening of the Italian Opera, but Lord Palmerston can come but for a political object, and, moreover, he has expressed the intention of seeing Louis-Philippe. The *Siècle* then calls upon the Cabinet to keep on its guard. Lord Palmerston it says thinks that the Tories are tottering, and that the Whigs may soon have a chance of recovering office; but he knows that an Administration openly hostile to France would have public opinion against it in England, and he is, therefore, coming to make his peace with Louis-Philippe and his Ministers.—Accounts from Toulon of the 18th inst. announce, that the schooner Etoile had been despatched on a mission to Tunis. It was believed that she was the bearer of an order to Admiral Parseval Deschènes to return to Toulon with the naval division under his command. Marshal Soult was expected in Paris to assume the Presidency of the Council during the King's journey to England. Marshal Bugeaud is expected to arrive in Paris about the same time, with six Algerian chiefs, who are to travel through France at the expense of the Government.—On the 8th inst. the Pope signed the dispensations necessary previous to the union of the Duke d'Aumale with Princess Caroline of Naples, his cousin-german.—The *Courrier Français* states that there are now building in the different French ports 23 ships of the line, 19 frigates, 2 brigs, 3 schooners, and 10 transports and store-ships, besides 6 steam-frigates of 450 and 550 horse-power, 11 steam-corvettes of 220 to 320 horse-power, and seven other smaller steam-ships of 80 to 160 horse-power.—Great festivities have been going on at Dieppe during the past week, in honour of the inauguration of the statue of Admiral Duquesne, born in that town 1610. Duquesne was one of the greatest naval heroes which France has ever produced, and he is celebrated among other exploits for his defeat of De Ruyter the Dutch Admiral in 1676, and of an English fleet off Bordeaux in 1650.—The first committal under the convention between France and England for the mutual extradition of criminals has taken place this week, Jacques Besset, who was under the firm of Pricener & Co., general merchants in Fenchurch-street, having been examined at the Mansion-house and delivered over to the French Government, charged under the law of France with fraudulent bankruptcy.

SPAIN.—M. Martinez de la Rosa has accepted the Ministry of Foreign Affairs. The official *Gazette* of the 16th publishes the degree appointing him to that post. Major-General Pavia was named on the 15th Captain-General of Navarre. On reckoning the ballots, it was found that the Ministerial party had completely triumphed at the elections of Madrid. The ratifications of the peace between Morocco and Spain had been exchanged. The Duke de Glucksberg was shortly expected at Madrid, where Mr. Bulwer was to arrive on the evening of the 16th. On the 11th the latter was at Tarifa, with Mr. Peel. All the accounts received from that place, Cadiz, Algesiras, and Gibraltar, concur in stating that the conclusion of peace between France and Morocco was principally due to Mr. Bulwer's exertions. Great apprehensions are entertained of a serious outbreak in the northern provinces, and the Government are apparently guarding against a surprise, by sending large bodies of troops into Navarre, where all the elections have been hostile to the Government.

PORTUGAL.—The Portuguese Cortes open on the 30th inst. The Minister counts on a majority of twenty-two in the Chamber of Deputies, and it is expected he will be in a minority in the Chamber of Peers. The Opposition now reckons among its members all the old friends and supporters of Dom Pedro, and all the former faithful servants and most of the Ministers at various past periods of Her Majesty the Queen.

BELGIUM.—Some serious riots have taken place at Verviers, in consequence of a decision come to by the Commissioners of Hospitals at that place to place the bospital "de la Providence" under the direction of the Society of Jesuits; an immense fermentation was the consequence. The people assembled in great numbers, and attacked the houses of some of the principal citizens. Tranquillity was, however, restored, on its being announced that the authorities had revoked the offensiv decision, and by the last account all was again quiet.—By virtue of a very old custom in Belgium, particularly in Brussels, the reigning Sovereign of this country becomes godfather to the seventh consecutive son of any family, however humble their situation may be. A few nights since, says a Brussels paper, the wife of an honest mechanic in that city gave birth to her seventh son, who will accordingly have the honour of becoming the godson of His Majesty.

GERMANY.—The *Hanover Gazette* of the 14th publishes the treaty of commerce and navigation entered into with England in July last. It is preceded by a notification that, on the exchange of the ratifications, it was agreed that the existing Customs tariff of Brunshan shall remain in force, but that the articles of British manufacture interdicted in the article of the treaty, will only pay, from the 1st October, when brought up the Elbe in British vessels, the duties fixed by Article 63, and from that date British vessels and their cargoes will pay no other duty than that fixed by this tariff.—The Berlin papers inform us that there will be an exhibition of the products of industry next year at Vienna, but that it will be confined to the manufactures of Austria, whereas the Berlin exhibition includes the products of the whole of Germany. The Emperor of Austria intends, it is said, to create a special order of merit for the manufacturers who shall be declared worthy of it, and the possessor of the decoration will be declared noble, but his nobility is not to be hereditary.—The Protestant Consistory Court of the Grand Duchy of Baden delivered, on the 14th August, its sentence in the proceedings for a divorce between his Royal Highness Prince Gustavus Wasa and the Princess Louisa Amelia Stephanie, and this sentence was confirmed by the Grand Duke on the 20th of the same month. The sentence dissolves the marriage concluded on the 9th September, 1830, and authorises both parties to contract another marriage.—The German papers announce the accession of Bohemia to the German Customs Union for a period of five years, and attach great importance to the event, as completing the Zollverein on the east.

ITALY.—The sixth scientific congress of Italy is now going on at Milan, and appears to be a very brilliant one. At the first general meeting of the society at the Palace of Brera, which has been set aside by the Austrian Government for its use, the statue of the celebrated Cavalieri, the Galileo of Milan, was inaugurated. The Viceroy of Italy was present. Count Borromeo presided, and M. Piola pronounced the introductory discourse. The celebrated Professor Orioli, against whom the Pontifical Government shut the gates of Padua, has been allowed to attend the meeting. — Letters from Florence state that the Grand Duke of Tuscany has gone to Trieste, where he is to meet the Emperor of Austria, who has repaired to that city, with some members of his family, and Prince Metternich, for the purpose of sea-bathing. It is said that the two Sovereigns will thence proceed to Milan, to be present at the sittings of the Scientific Congress. The journey of the Grand Duke may, however, be connected with a project of which Austria is said to be secretly pursuing the execution, the establishment of an Italian Customs Union. Report states that a proposition to that effect is to be made at the Congress of Milan, and that all the Italian States except Naples will join in the negotiation. The attempt made by the Italian revolutionists who had taken refuge at Malta and at Corfu to enrol bands of adventurers in Albania in order to organise another expedition against the Roman States, has it is said completely failed. It is announced that M. Mazzini is about to publish a pamphlet, entitled *The Last Moments of the Patriots sacrificed at Cosenza.*—The political annual for the Roman States has just been published. It contains the following facts:—On the 18th inst. the Pope will have accomplished his 79th year. He has occupied the Holy See since the 2d Feb. 1831. The sacred college consists of 60 cardinals, six of whom are cardinal-bishops, 44 cardinal-priests, and ten cardinal-deacons. There are still living two cardinals, created by Pius VII., Oppizani and Riario Sforza, and seven by Leo XII. The 51 remaining were appointed by the present Pope. Monsignor Tardini, the oldest cardinal, is 85 years of age, and the youngest, Monsignor Schwartzenberg, 35. At the close of 1843 Rome possessed a population of 170,701 inhabitants, exclusive of the Israelites.

CITY.

Money Market, Friday. — Consols closed at 100 for Money, and the Account; Exchequer Bills, 74 to 76; India Bonds, 93 pm.; India Stock, 288½.

GAZETTE OF THE WEEK—BANKRUPTS—C. R. WILLERT, Church court, Clements-lane, City, merchant—D. J. MACKENZIE, 33, Chambers-street, Minories, provision merchant—W. A. MEARNS, Acre-lane, Clapham, ale brewer—J. W SNELL, formerly of Mount place, Mile-end-rd., but now of Ramsgate, lodging-house keeper—P. ROBINSON, Warrington, Lancashire, bottle manufacturer—T. M. MONCKMAN, Bradford, Yorkshire, tobacconist—H GIBBONS, Wolverhampton, chemist—W. BOWEN, Merthyr Tydvil, Glamorganshire, grocer—E M'LAUGHLIN, Long-lane, Bermondsey, hair merchant—F. B. and W STACY, Lawrence-lane, Cheapside, warehousemen—J. G. WEBB, Rosamond buildings, Islington, mineral water manufacturer—T. ELDRIDGE, Upper North-place, Gray's Inn-road, coach builder—W. WILLIAMS and J. SAWYELL, Newport, Monmouthshire, corn and provision merchants—J LEYBOURN, Bradford, Yorkshire, provision shop keeper—J. LAMBERT, New Elvet, Durham, grocer.

DECLARATION OF INSOLVENCY—A. KNOTT, Brighton, out of business—T. W BOOTHWORTH, Hulme, Lancashire, draper.

SCOTCH SEQUESTRATIONS.—J HERRIOT, Glasgow, wine merchant—A. MURRAY, late of Muirhouse, but now of Canongate, Edinburgh, farmer—R. STEVENSON, late of Paisley, accountant, but now of Glasgow, general commission agent—J WATT, Edinburgh, turner—D. MILN, Dundee, grocer—H. LAIG, Glasgow, manufacturer.

Metropolis and its Vicinity.

Approaching Election for Lord Mayor.—The nomination of Lord Mayor takes place this day, Michaelmas

Day this year falling on the Sunday. Speculation is still very great as to the person who will be selected to fill the chair. The friends of Alderman T. Wood and Gibbs have been exerting themselves for the purpose of returning them at the Common Hall, and the friends of Alderman Wood are determined, in case of the rejection of that gentleman, to go to the poll. By some it is expected that both Alderman Wood and Gibbs will be passed over, and that the present Lord Mayor and Alderman Johnson will be put in nomination. Several meetings of the friends of Alderman Wood have been held, at which resolutions have been adopted to the effect that the charges brought against him with respect to the Talacre Company are groundless, and that he is in every way worthy to fill the office of chief magistrate.

Election of Aldermen.—Mr. Sheriff Sidney was elected on Thursday Alderman of Billingsgate ward, without opposition. The nomination of an Alderman for Portsoken ward took place on Wednesday, when Mr. Sheriff Moon and Mr. David Salomons, the ex-sheriff, were put in nomination. Mr. Moon stated that he had offered to retire if Mr. Salomons would promise to make the necessary declaration if elected; but Mr. Salomons declared that he would continue to adhere to the Jewish faith. About nine years ago Mr. Salomons was returned to the Court of Aldermen, but rejected by them because he would not make the usual religious declaration. The Lord Mayor took a show of hands, when a considerable majority were held up for Mr. Salomons. His lordship declared the election, on a show of hands, to be in favour of that gentleman; upon which a poll was then demanded by Mr. Moon, and granted. The result of the first day's poll gave Mr. Salomons a majority of 38. The second day, which closed the poll, gave Salomons, 168; Moon, 136. Majority for Salomons, 32.

Court of Aldermen.—It is currently reported in the city that Alderman Sir John Pirie has received an intimation that he will be appointed a Commissioner of Excise. Of course an immediate resignation of his gown will be the consequence; and another vacancy in the aldermanic body will take place.

Custom House.—It is understood that the Custom-house authorities have it in contemplation to place officers on board the steamers from the Continent, as soon as the vessels arrive off Gravesend, so that the inspection of luggage, &c., may be completed during the passage up the river. The object of this experiment is to prevent the detention of passengers after their arrival, and if found to give protection to the revenue, it doubtless will be continued, and be a most important improvement.

New Royal Exchange.—The progress of this structure is so far advanced that the committee of Lloyd's have announced to the subscribers that the subcription-room will be prepared for the transaction of business in a short time. The centre area of the Exchange is nearly all laid down with the tesselated pavement. The building is entirely cleaned externally, and workmen are employed in placing the flagstones, many of which are from eight to ten feet square. Iron gas pillars are erected at short distances from each other, on every side of the edifice, and the gas pipes are almost all fixed. The mechanism of the clock is now being put up, under the superintendence of Mr. Dent, of the Strand, and is expected to be completed in the course of the next week. The bells, 15 in number, have been in the tower some days.

Royal Mint.—An immense number of a new coinage of half-farthings, which for the last ten days have been selling in the different thoroughfares of the metropolis at four and six a penny by the itinerant street venders, have been struck at the Mint for the last month, and will be issued as legal tenders of our copper circulation, on Tuesday next, the 1st October, according to the Royal proclamation announcing their issue a year and a half ago, but which had been delayed in the United Kingdom, although in the colonies they have been for some time current. The various shopkeepers, grocers, and tea-dealers, in the Borough and different parts of the metropolis, have large bowls in their windows full of this new coinage, which will be useful to the working classes, as "half farthings saved are pennies gained."

Bank of England.—The Proprietors of the Bank of England held their half-yearly meeting last week, and the usual dividend of 3½ per cent. (deducting income-tax) was declared for the half-year. The meeting occupied less than a quarter of an hour, and was, therefore, the shortest that has been known for many years. An alteration in the mode of making up the accounts was communicated by the Governor, and was acted upon for the first time on this occasion. Hitherto the accounts have been made up to the 10th October, and the portion of the "rest" that was to accumulate between the day of the meeting in September and that day was only given by estimate. Now the accounts are made up to the 31st August, and, consequently, the "rest" is stated according to actual results. A corresponding alteration is to be made in the beginning of the year, and the last day of February, instead of the 5th of April, will be the day on which the accounts for the current half-year will be made up. The Governor, Mr. Cotton, stated that the Bank will sustain no loss by the late forgeries of Barber and Fletcher, the Commissioners for the National Debt having to sustain it.

St. Paul's.—In consequence of the cleansing and repairs which have been going on in this cathedral for some time, divine service has been entirely suspended, and great complaints have been made against the Dean and Chapter on the subject. It is now announced that the service will recommence to-morrow the 29th inst.

Proposed New Hospital at Blackfriars.—On Monday morning a numerous meeting of the inhabitants of the parishes of St. Bride's, Fleet-street, St. Anne's, and St. Andrew's, Blackfriars, and Bridewell precincts, was held for the purpose of taking measures to prevent the contemplated establishment of an infirmary for the cure of cutaneous diseases, at the house, 25, Bridge-street, Blackfriars, formerly occupied by Barber, the solicitor concerned in the Wills Forgeries. The requisition convening the meeting was signed by upwards of seventy inhabitant householders. Mr. Delane took the chair, and stated that in the house at which it was intended to have the infirmary the means of accommodation were extremely small. The house was confined, abutting on three streets, and having at the back only two or three yards of open space. It had been calculated by the projectors of the institution that they would have 500 patients a week, all of whom would have to be in attendance nearly every morning. As it was impossible that all could be accommodated at once, a large majority of them would have to wander about the adjacent streets, or to take refuge under the porticos of the neighbouring houses. Resolutions affirmatory of the danger to the interests and health of the parishioners to be apprehended from the infirmary were proposed and carried, and a committee appointed to carry out the object of the meeting.

Christ's Hospital.—Saturday being St. Mathew's-day, the annual orations were delivered by the senior scholars, according to a custom which has prevailed for many years in connection with this ancient institution. Previous to the delivery of the orations divine service was performed in the church adjoining the Hospital, in the presence of the Lord Mayor, Aldermen Musgrove, and Sheriffs. At the conclusion of the service, the Lord Mayor and gentlemen by whom he was accompanied, in their official robes, entered the hall of the Hospital, where the whole of the scholars and an exceedingly large and respectable company had already assembled. The Lord Mayor having taken his seat at the top of the hall, the Grecians proceeded to deliver their addresses in the following order:—A Latin oration by Langham Dale, 2d Grecian; an English one by M. A. Leicester, 1st Grecian; a Greek oration by E. T. Hudson, 3d Grecian and classical medalist; and a French one by E. A. Newton, 11th Grecian; all upon the same subject, and one full of interest to every person present—"the benefits of the Royal Hospitals." The three first named of these gentlemen are proceeding to College—the first to Queen's, Oxford, the second to St. John's, and the third to Trinity, Cambridge. Several other orations were then delivered, and at the close of the proceedings a collection was made for the purpose of defraying the expenses of the Grecians at College.

East India Company.—At the Quarterly Court of Proprietors on Wednesday, the resolution adopted at the last Court, granting an annuity of 1000*l.* a year to Major-Gen. Sir Wm. Nott, was confirmed by acclamation. The other business transacted was of a routine character, the motions respecting the payment to the Temple of Juggernaut, the King of Delhi, &c., having been withdrawn.

Improvements in the Tower.—After considerable delay preparations have commenced this week for the extensive improvements about to be made in the Tower, agreeably to plans approved of by the Government. Barracks are to be built on the site of the small armouries which were destroyed by fire in 1841, but as their width will be greater than the late buildings, the frontage of the new barracks will encroach several feet upon the consecrated ground extending eastward from the royal chapel of St. Peter, in which are deposited the mortal remains of many distinguished personages. Their remains are, however, to be carefully raised and placed in a vault at the rear of the chapel.

Vauxhall Gardens.—The "royal property" has been restored to its pristine brilliancy this week for the purpose of bidding a final farewell to the public before the hand of the builder destroys its trees and all the appliances for public entertainment, and occupies the ground with rows of houses. Six gala nights have been announced, and on Monday the first of the series was given. The illuminated arcades, the orchestra, and the saloon, were just the same as in days gone by; nor were there any indications of approaching ruin. The entertainments consisted of a concert, ballet, pantomime, and display of fireworks, which fully maintained the reputation of Vauxhall in its best days.

Battersea New Park.—The Commissioners of Woods and Forests have determined, it is said, upon purchasing Battersea-marsh and fields, a tract of land upwards of 200 acres in extent, and making a public park, to be adorned with lakes, serpentine walks, shrubberies, &c. In addition to this, it is said that there will be a carriage drive along the margin of the Thames from Vauxhall to Battersea-bridge. An eminent builder has been directed to furnish the plans, and as soon as these are completed an application will be made to Parliament.

The late Sir Astley Cooper.—A statue has just been placed in St. Paul's Cathedral to the memory of Sir Astley Cooper, the eminent surgeon. It was raised by subscription, confined to the profession. The greater portion of the donors were his former pupils, headed by Mr. Callaway and Mr. Travers. The statue, exclusive of the pedestal, is 8 feet high, and the likeness is considered good. It is by Mr. Baily, R.A.

London Missionary Society.—On Wednesday the Jubilee meeting of the friends of this Society was held at Exeter Hall, to celebrate the 50th year of the Society's existence. The platform was filled with Dissenting Ministers from all parts of the country, and some clergymen. In the body of the hall there were upwards of 4000 persons. Sir Culling Smith, Bart., took the chair, supported by Mr. Pritchard, late Consul at Tahiti; the Rev. E. Bickersteth, Rector of Walton, Herts; Dr. Vaughan, Principal of the Lancashire Independent College; Dr. Jenkyn, Principal of Coward College; Dr. Collison, Dr. Lichfield, Messrs. Sherman, Jay, &c. The chairman in opening the business remarked that the Society had succeeded to a great extent in breaking down the bonds of caste in India, and in carrying on the evangelisation of savage tribes in Africa. Their Wesleyan brethren had broken the chains of slavery in the West. The American missionaries had carried the Gospel into the midst of the fallen Eastern Churches, while the Churches of Scotland had exerted themselves in planting the principles of the education of their native country amongst the benighted people of Hindostan. But the subject which more especially pressed itself upon the attention of the Missionary Society was the state of Popery, which he had no hesitation in saying was now on the verge of destruction. Still that system was as false, superstitious, and tyrannical as it was when England broke the chains, or thought she did, in the fifteenth century. The chairman concluded by narrating several anecdotes in support of his statements. A resolution expressive of gratitude to Providence for the favour bestowed on the Society during the last 50 years, was moved by the Rev. E. Bickersteth, seconded by Dr. Bunting, President of the Wesleyan Conference, and carried unanimously. Dr. Liefchild moved the second resolution, deploring the persecutions of the Christians at Madagascar and Tahiti, expressing towards them cordial sympathy and prayerful solicitude, and condemning the perfidy and cruelty of France towards the unprotected Queen of Tahiti. Fifty years ago this Society had only three missionaries, now it had 700; then there was one station, now there were 85, with various preaching places around them. Since its formation, a million and a half sterling had been expended, chiefly the contributions of British Christians. The resolution having been seconded by Mr. Hamilton, Minister of the Scotch church, was unanimously passed. A subscription was entered into on behalf of the Society's general objects, and the large sum of 500*l.* was announced. Other resolutions were proposed, several addresses were delivered, and the meeting dispersed after singing the Doxology and paying the usual courtesy to the chairman.

Singular Voyage on the River.—A novel feat was successfully performed on Monday on the river, between Vauxhall and Westminster bridges. Mr. Barry, one of the clowns of Astley's Theatre, had announced his intention of sailing from Vauxhall to Westminster in a washing-tub drawn by two geese. A large crowd assembled on both sides of the river to witness the undertaking. At about half-past 3 Mr. Barry, with several of his friends, and attired in his clown's dress, arrived at Vauxhall-bridge, and, all things having been prepared, he at once stepped into his tub and started upon his voyage. The tide being in his favour, he went along safely enough, and had little difficulty in making the geese keep a proper course. An immense number of boats accompanied this strange water party, so that he was in no danger of drowning. Mr. Barry disembarked from his vessel at Westminster-bridge, and proceeded amidst loud cheers to the theatre. The same feat was performed some years back by Mr. Usher, the well-known clown.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Sept. 21: West Districts, 128; Northern, 164; Central, 152; Eastern, 183; Southern, 230; Total, 857. Weekly average for the last five years, 946.

Provincial News.

Deal.—The recent attempts to fix Mr. Steward's beacon on the Goodwin Sands are said to have failed; but the experiments of Mr. Bush, the civil engineer, who made so many persevering efforts in 1842 to fix a caisson on the Sands, promise to be more successful. The following letter has been addressed by Mr. Bush to the Committee of Lloyd's:—"Having been engaged for several months in erecting on the site of the caisson sunk on the Goodwin Sands by me, during the autumn of 1842, an iron column, with the two-fold object of fixing thereon a red light, for the guidance of mariners, and for boring the quicksand to ascertain its depth, with the ultimate view of erecting a more permanent light-house, I have the honour of informing you that I have already fixed the column 9 feet above high-water-mark, and shall, in the course of the next fortnight (weather permitting), carry it up to the height of 30 feet; and that, on or before the 1st of November next, I shall show at the top of the column a brilliant red light. The true bearings of the other lights have not yet been ascertained accurately, but shall be furnished to you in the course of next week."

Ffon.—An adjourned inquest was held at Old Brentford on Wednesday, on the body of John Shaw, whose thigh was severely fractured by a fall of earth on the 5th August last, at Slough, and was conveyed to the Eton union workhouse, where he died on the 12th inst. At the previous proceedings the friends of deceased made certain allegations against the officers of the Eton union, to the effect that deceased had been grossly neglected; that they were not permitted to see him, except in the presence of the matron or porter; that on his becoming worse, and their going to Slough at midnight, they were refused to see him; that the food they took to him they were not allowed to give him; and that had they not fetched the body to Brentford, it would have been buried by the union authorities without any inquest. After a long inquiry before Mr. Wakley on Wednesday, the jury returned the following verdict:—"We find that deceased died from the mortal effects of a fracture of the left thigh bone, produced by accidental causes. In returning a verdict of accidental death, the jury consider

it to be their duty to state that they are decidedly and unanimously of opinion that the refusal of the governor and matron of the Eton union workhouse to allow any conversation to pass between the afflicted man and his wife, sister, and mother-in-law, except in the presence of a listener and a spy upon their conduct, is a part only of a system of moral treatment adopted towards the poor man, which is a disgrace and a scandal to a Christian country; and that the refusal to receive and give shelter to the wife and other poor relations when they arrived at the union workhouse at midnight, in a strange place many miles from their homes, to pay as they thought a last visit to a dying husband, brother, and son-in-law, was in the opinion of the jury an act of so cruel and inhuman a character that any person by whom such conduct could be perpetrated is altogether unfit to be intrusted with the care of the poor." On the master and matron of the workhouse leaving the house with their witnesses, about an hour before the verdict was returned, on their way to Slough they were greeted with a volley of hisses from the crowd in front of the house. The inquiry occupied twelve hours.

Exeter.—A new sect, in imitation of the Free Secession in Scotland, has just sprung up in this city within the pale of the Church of England. It is called the "New Free Church in England," and its chief and most curious feature is the announcement that it is an episcopal establishment, which will allow, however, no bishop to interfere in its concerns. The promoters of this schism are Church of England clergymen, two of whom, the Rev. H. B. Bulteel, formerly Fellow of Exeter College, Oxford, and the Rev. S. Shore, M.A. of Bridgetown, near Totness, opened the new church in Exeter on Thursday. We extract the following from their address to the public, stating their objects and principles:—"It has long been felt by very many who are attached to the doctrines of the Protestant Church, as well as to episcopal order, scrupulously administered, that for the preservation and increase of evangelical religion, in these days of revived superstition and arrogant assumption, it is highly desirable to attempt the formation of an episcopal church, distinct from the Established Church, on a sufficiently comprehensive basis to effect the union of genuine believers in Christ, who may not object to episcopal discipline, though otherwise differing in some unimportant points. The promoters of this work entertain the most cordial esteem for all who love the Lord Jesus Christ in sincerity. With such they would be on terms of Christian friendship, their sole controversy being with the anti-evangelical doctrines and practices now so fearfully spread in this diocese and throughout the land."

Gloucester.—The Triennial Meeting of the three choirs of the cathedrals of Gloucester, Worcester, and Hereford, the oldest musical festival in England, and the foundation from which all the others have sprung, commenced on Tuesday. The arrangements were on a new and more economical plan, the engagement of foreign singers on enormous terms having been abandoned. The programme contains three morning performances in the cathedral; the first consisting of Handel's "Samson," as performed at Norwich; the second, a portion of Haydn's "Creation," Mendelssohn's "Hymn of Praise," and "Israel in Egypt;" and the third, "The Messiah." There are three evening concerts, made up of the usual materials—the most popular vocal and instrumental pieces of the past London season. There is one new feature; instead of a single ball to conclude the festival there are three balls, one after each concert, for which Adams's quadrille band is engaged. The first day's performance was attended by not less than 2000 persons, and at the close of the service 163*l.* were collected at the doors. At the Shire-hall, in the evening, a miscellaneous concert took place, and selections were given from "Acis and Galatea," and other works. The proceedings of the day terminated with a ball, which was fully attended.

Huddersfield.—One of the most munificent examples of benefactions for public improvements which have been recorded for some years is mentioned in the local papers as having just occurred in this town, Sir John Ramsden, who had previously been a great benefactor to the neighbourhood, having bequeathed a sum for the improvement of Huddersfield, amounting to no less than 20,000*l.*

Hull.—On Thursday last week, a Roman Catholic gentleman was admitted into communion with the Church of England, at Ellerker, in this riding. The convert was Mr. Boham, attached to a party conducting the Government Ordnance survey of the county of York. He had been for some time in a course of instruction, under the Rev. G. F. Townsend, incumbent of Ellerker; and on Thursday was admitted by Archdeacon Wilberforce, and other clergymen, into the Church of England.

Manchester.—We lately noticed the liberal contribution of Sir Robert Peel to the fund for forming a public park in this town, and the handsome letter by which it was accompanied. We now learn that the directors of the Phœnix Fire Office have contributed 200*l.* towards the same object, announcing their gift in the following letter, which is creditable to all parties:—"The benevolent measure entertained by the leading merchants and manufacturers of your town, for the promotion of the health and comfort of its industrious population, by the establishment of public walks and gardens, has to-day come under the notice of our board; and the board, feeling that during its long and extensive connection with the trade of Manchester, the Phœnix Company has had frequent experience of the good disposition of the labouring classes, when their personal services have been required, in cases of fire, are desirous to avail themselves of the opportunity which the measure alluded to presents of adding their assistance towards the success of a measure so well calculated to effect the object contemplated. I am therefore instructed to request that the name of the Phœnix Company may be added to the list of contributors for the sum of 200*l.*"

Newcastle-on-Tyne.—The local papers state that a sum sufficient to produce an income of 120*l.* a-year has been contributed by Messrs. Bigge, manufacturers of this town, towards the endowment of a church, which they are now building at Shotley-bridge, Northumberland, for the benefit of the artisans in their employment.

Oxford.—The following circular has been addressed to members of Convocation:—"Oxford, Sept. 23, 1844.—Members of Convocation are respectfully informed that the Vice-Chancellor, although requested by the Senior Proctor, has refused to give any information as to the day of the nomination of his successor. Whether this information will be open to Dr. Symons, members of Convocation may decide for themselves from the events of the past year. At all events it is to be hoped that they will hold themselves in readiness to come up on the receipt of a notice of the day, if the discovery of it prove possible; or, if not, to show in some other marked way their sense of this fresh act of injustice."

Portsmouth.—A fine French steam-frigate, named Le Caïman, came into this harbour from Cherbourg last week, bringing despatches to the Commander-in-Chief at this port, notifying the intention of the King of the French to land at Portsmouth in the second week in October; the precise day and hour, however, named in the despatch is only known to the Commander-in-Chief and the Lords of the Admiralty. The despatches are to the effect that His Majesty wishes accommodation provided for the fleet which will accompany him to this country. The Baron de la Roncière Lenoury, Aide-de-Camp to Admiral La Susse, who will command the fleet or squadron in attendance upon His Majesty, arrived in Le Caïman to present the despatches, and conduct the necessary arrangements for His Majesty's reception. Le Caïman did not salute in coming into harbour. She is a remarkably fine frigate. Her officers had a good view of the Queen, 110, Captain Martin, which was leaving the harbour under canvas at the time the Caïman was entering it. A finer specimen of a British man-of-war could not have been exhibited, and her leaving the harbour at such a moment was most opportune. It was a beautiful sight, and many thousand persons assembled on the fortifications to witness her departure for Spithead, where she is now moored in the position lately vacated by the Collingwood. She was beautifully manœuvred in going out of the harbour.

Sunderland.—The excitement created by the trial of Belaney, on the charge of murdering his wife, at Stepney, still prevails in North Sunderland and its neighbourhood, where he has been living since his acquittal. On Monday week last the populace collected in great numbers about 8 P.M., and paraded the streets and lanes with three effigies, the first representing Belaney, the second "the archfiend," and the last one of Belaney's friends, who resides in Newcastle, and who took a very prominent part in the late trial in favour of the prisoner. On the procession reaching the gates of Belaney's house, about 9 o'clock, they began to set fire to the effigy outside the gates, upon which Belaney rushed out of the house, and fired off a pistol in the direction of the crowd, but he was glad to make a hasty retreat, dropping his pistol on the way. His conduct so exasperated the populace, that they commenced a general assault on the house, battered in the shutters, and demolished the glass windows. Having effected an entrance, they destroyed everything that came in their way. In the confusion Belaney effected his escape, and contrived to elude the vigilance of his pursuers by secreting himself in a neighbouring corn-field, otherwise there is little doubt his life would have been sacrificed. The crowd then set fire to the gates and to two of the figures, and finally suspended that representing Belaney by the neck from the chimney-top of a house on the opposite side of the road. The house on the following morning had all the appearance of a place that had undergone a military assault, the walls being battered as if struck by hundreds of cannon-balls. But the work of destruction did not end here. The populace again assembled on Wednesday night, and burnt the premises to the ground. The situation of the house was a very romantic one. It is at the end of the village, near the edge of the cliff, overlooking the sea, the drawing-room windows being only a few inches from the summit of a fearful precipice. It was built according to a plan laid down by himself, and has long afforded a subject for gossip among the rustic population of that locality. The following additional particulars have been communicated to the *Morning Chronicle*, by a correspondent in the neighbourhood:—"During the time the conflagration was proceeding, various articles of furniture were flung out of the windows, in order to save them from the devastating element, but they were instantly flung into the flames by the mob, and in a short time everything was consumed. Belaney effected his escape, and it is not known whither he has directed his steps, but I have been informed that during this morning he was seen walking on the quay in this town. The news of the destruction of his property is hailed by all with delight; and two or three persons, in my hearing, on being informed of the event, expressed their sorrow that he was not consumed as well as his property. The popular indignation towards him knows no bounds; and if he remain in this neighbourhood much longer, his life will certainly be sacrificed. It is said that the shopkeepers in North Sunderland have refused, ever since the trial, to sell him even the necessaries of life: and indeed this is not to be wondered at, considering the light in which he is regarded here by everybody. I have conversed with many persons about him, and not a word of commiseration towards him has escaped from one of them. A handbill has been circulated extensively in the district, and is known to have excited Belaney's ire. How he can have the effrontery to remain at North Sunderland, with hundreds about him thirsting for his blood, is a mystery; it is supposed that he was at first determined to brave the popular feeling, and by residing, as usual, in North Sunderland, to endeavour to stamp on the mind of his neighbours the idea that by so doing he was innocent; last night's proceedings will, however, convince him that North Sunderland is no longer an abiding place for him."

York.—The 14th Annual Meeting of the British Association commenced business in this city on Wednesday, when the sectional officers were elected; and on Thursday the first General Meeting of the whole body was held, when the chair was taken by the President of the last meeting, the Earl of Rosse, who was afterwards succeeded in his office by the Rev. Dr. Peacocke, the Dean of Ely, President for this year. The Vice-Presidents of the year are, Earl Fitzwilliam, Viscount Morpeth, the Hon. Stuart Wortley, Sir D. Brewster, Professor Faraday, and the Rev. W. V. Harcourt. It is said that the meeting will be a highly respectable one, and show a good list of names known in science, and present interesting reports and papers. Professor Liebig is already here, and Professor Mattemer, and other well-known foreigners, are expected.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2828*l.*; Bristol and Gloucester, 1117*l.*; Eastern Counties, 4427*l.*; Edinburgh and Glasgow, 2827*l.*; Great Western, 17,471*l.*; Grand Junction, 8920*l.*; Glasgow, Paisley, and Ayr, 1547*l.*; Great North of England, 1857*l.*; London and Birmingham, 18,180*l.*; South Western, 8030*l.*; Blackwall, 1123*l.*; Greenwich, 750*l.*; Brighton, 5909*l.*; Croydon, 550*l.*; Liverpool and Manchester, 5596*l.*; Manchester, Leeds, and Hull, associated, 8324*l.*; Midland, 11,262*l.*; Manchester and Birmingham, 3720*l.*; Newcastle and Carlisle, 1806*l.*; Newcastle and Darlington, 1112*l.*; Preston and Wyre, 566*l.*; South-Eastern and Dover, 5995*l.*; Sheffield and Manchester, 911*l.*; York and North Midland, with Leeds and Selby, 3289*l.*; Yarmouth and Norwich, 361*l.*—The Railway department of the Board of Trade have given notice that in addition to the schemes already announced as under consideration, they will proceed to examine, with the view of reporting to Parliament, the schemes proposed for connecting Portsmouth with London, by more direct lines of railway communication, and the Richmond and West-End Junction, and other schemes for forming a central terminus in the neighbourhood of Waterloo and Hungerford bridges.—A meeting of gentlemen connected with the western division of Suffolk was held in the Shire-hall, in Bury St. Edmund's, last week, for the purpose of considering the best means by which a railway could be established between Bury St. Edmund's, the other parts of the county, and the metropolis. The meeting was attended by Earl Jermyn, Sir H. E. Banbury, Bart., Sir Hyde Parker, Bart., the Rev. Sir A. Henniker, Bart., and upwards of 300 gentlemen connected with the county. A resolution was unanimously adopted, that a railway proceeding from the Norwich and Brandon Railway, at or near Thetford, to Bury St. Edmund's, appeared to be best adapted for the interests of the western division of the county, and a provisional committee was appointed for carrying this resolution into effect. Sir John Rennie was nominated the engineer to the line.—Meetings have been held at Liverpool, Dorking, Portsmouth, and Dudley, to explain respectively the merits of the Sheffield and Lincoln extension to Gainsborough; of the Portsmouth direct line; and of the Oxford, Worcester, and Wolverhampton line; at each of which resolutions were passed in support of the proposed undertakings. The rage for new projects does not appear to have abated, and the readiness with which the new issues of stock brought into the market are purchased at a premium, is sufficient evidence to prove that the spirit of speculation is once more afloat, liberally supported by the abundance of unemployed capital. It is, however, prudent to be prepared for the reaction. The fluctuation in prices attendant on new schemes cannot be better illustrated than in the cases of the shares of the London and York and the Portsmouth direct companies. These during the last week have borne high premiums, but within the last two days they have suddenly become flat and depreciated. The reason assigned for the re-action in the value of London and York is the resignation of Mr. Locke, the engineer, who does not sanction the proceedings of the committee in joining with the Manchester and Leeds Company; and in the case of the Portsmouth direct line rival projects are mentioned, which, it is said, will most likely interfere with the smooth course the promoters marked out for the success of the undertaking. Mr. Cubitt is announced as the engineer in chief of the York line in the room of Mr. Locke. For securing the traffic of North Kent two or three companies are in embryo. The South-Eastern directors have started the consideration of a line to connect London with Rochester, Chatham, Faversham, and the intermediate districts, and to join their line near Chilham. The inhabitants of Faversham have, however, refused to give it their support till they have had the opportunity of acquainting themselves with the plans of the other companies.—The Preston and Wyre Company have determined upon constructing a line a little more than three miles in length from Blackpool, to join their railway at Poulton, the cost of which

will be from 20,000*l.* to 24,000*l.* As there is no opposition on the part of the landowners, no impediment stands in the way of a speedy completion of the undertaking. The necessary funds are to be raised by the issue of 7500 new shares, and to be allotted in the proportion of one new share to the holder of every two original shares. The value of the shares are to be fixed at 8*l.* 6*s.* 8*d.* each, only half of which is to be called for till the Lytham branch is commenced.—The Ulster Company have declared a dividend of 15*s.* per share from the balance of net profit, stated at 8481*l.*, which would leave 693*l.* 15*s.* 3*d.* to be added to the reserved funds. The gross receipts of the half-year from traffic amount to 13,856*l.*—Since the Act for the Dublin and Cashel Railway received the Royal assent, all the shares have been purchased for the extensions to Limerick and Cork, and for a line to Mullingar, Athlone, and Longford, running from the trunk at Lucan, and intersecting the finest districts of Kildare and Meath; while the applications for shares in the Drogheda and Portadown Company, making a continuous line between Dublin and Belfast, amounted to 40,000 in three days—being more than double the number advertised in the prospectus. In addition to these, there are several other companies in course of formation, principally in connexion with the north of Ireland, all involving an outlay of millions of capital.—On Tuesday, the opening of the branch line from the London and Dover Railway to Paddock's Wood, 46 miles from London, took place with the usual ceremonies and rejoicings. The line is 10 miles in length, and has cost 100,000*l.* The Directors and their friends took the chief part in the proceedings, and at the Maidstone terminus the train was met by the mayor and corporation, by whom the visitors were conducted to the Town Hall, where 250 persons sat down to a public dinner.

IRELAND.

Dublin.—"The National Banquet to O'Connell and the rest of the liberated martyrs,"—to use the words of the advertisement—took place on Thursday the 19th at the Music-hall, Lower Abbey-street. Covers were laid for about 800, and as the Hall was crowded it may be supposed that about that number sat down to dinner at six o'clock, long before which hour all the seats were occupied. As each gentleman was entitled to a lady's ticket, about a similar number of ladies in full dress filled the galleries. The Hall was brilliantly lighted, but very slightly decorated, and the only inscriptions were, "Remember the 30th of May, 1844;" "The Repeal of the Union;" "Peace and Perseverance;" "Lords Denman, Cottenham, and Campbell." Mr. W. S. O'Brien was in the chair. On his right sat Mr. O'Connell, Dr. Higgins (Bishop of Ardagh), the Rev. Mr. Tierney (ex-traverser), Rev. Mr. Tyrrell (Protestant clergyman); on his left the Lord Mayor of Dublin, Lord Ffrench, and Dr. Cantwell (Bishop of Meath). There were also at the same table the "rest of the liberated martyrs," the Hon. Mr. Hutchinson, Dr. M'Nally (Bishop of Clogher), Rev. Mr. Kennedy (Protestant clergyman), Sir J. Power, the Mayors of Cork, Limerick, Waterford, Kilkenny, Sligo, Clonmel, and Drogheda; Mr. Somers, M.P., Mr. Blake, M.P., Mr. D. Browne, M.P., Mr. Power, M.P., Mr. Maher, M.P., Mr. Kelly, M.P., Mr. E. B. Roche, M.P., &c. The Chairman, after proposing the usual loyal toasts, gave, with a complimentary introduction, "Mr. O'Connell's health and happiness, and that he may live to see the darling object of his life accomplished—the Repeal of the Union." (Loud and enthusiastic cheers, several times vigorously repeated, until at length the whole company, including the ladies, rose and waved their handkerchiefs).

Mr. O'CONNELL said—"There cannot be one amongst you who supposes that I rise to pour out my gratitude. No; I rise for another, a better, a nobler purpose. I rise to instigate you all, and, through you, to arouse all Ireland, to renewed exertion for the Repeal of the Union. (Cheers.) It is very good to cheer—it is very pleasing to be cheered, provided it does not last too long; but cheering alone won't do, words won't do, we must have actions. From this spot I call upon every man, of every creed, sect, and persuasion throughout Ireland, to rally for Ireland. The illustrious Grattan well said that he stood by the cradle of Irish independence—that he followed her to her grave. She is not dead, my friends, she only sleeps; and here am I calling upon you to sound the trumpet for her resurrection. Yes, she shall arise, she must rise in her native dignity, majesty; she will arise, glorious and as far immortal as anything earthly can be. Gracefully she shall proceed in her career of liberty and happiness, gently bowing the head of allegiance to the English crown, but asserting firmly her right to be governed by her sons. Ours is a country that ought to be free, and must be free. She has been too long sunk in provincial degradation—she must be the sister and co-equal of England, and not continue the slave of any land. And are our prospects darkening? Is the vista gloomy through which we behold the coming dawn of Irish freedom? No; we are triumphant to-night—we are celebrating our triumph—it is an ovation for Ireland and freedom, and the glorious prospect of liberty shines bright and steady before us. We are celebrating a triumph. A celebrated French General has rightly asserted, that difficulty does not consist in obtaining victory, but in profiting by it. We have gained a victory—certainly without personal difficulty to ourselves, for it came at a moment that it was least expected, and when we anticipated that the dark bolt of Ministerial injustice was shot closely on the door of our prison. At that very moment there came an unseen hand that shook to pieces every obstacle—the prison door was opened, and it was declared that Ireland had a right to take her measures to obtain legislative independence. And how are we to profit by that decree, except by redoubling our exertions, and by one and all being prepared to approach the British Houses of Parliament, at the commencement of the ensuing session, with the combined voices of the Irish people, collected together in petitions, in order to give haughty England to understand that there is no rest for the wicked—that she shall have no rest until Ireland is free again. What, then, is our first duty? To combine together Irishmen of every sect and persuasion, and, above all, to combine those of every gradation of political opinion who agree with us in seeking for the one thing necessary—a Repeal of the Union. I heard with pleasure a letter of Mr. S. Crawford read at the commencement of this meeting, and felt somewhat surprised that he should think, or for a moment suppose, that the leaders of the great national agitation had excluded federal repealers from the Association. Now, I am happy to inform that gentleman, and all federalists, that such is not the case, and that, on the contrary, we are delighted to have men who wish to see their country prosper—and think she will prosper with a federal Parliament—enrolled as members. I prefer—and most of those around me, I believe, prefer—a simple Repeal of the obnoxious Act of Union; still there are none of us who would not be glad to see a federal Parliament established in this country. I do not think it the best, but I never was one of those who would depend upon the infallibility of his own judgment, and who would not yield to the man who thought federalism better—which would give at all events to the Irish the power of making laws for themselves. On the contrary, I have always encouraged and courted the co-operation of those who professed federalism, and upon the profession of those opinions numbers have joined the Association. Mr. Gray Porter, the Protestant High Sheriff of Fermanagh, has proclaimed himself a federalist, although he has not yet joined us—and I have called upon him in the name of the Irish people, and offered him if he should become a member of the Association, the position of a leader in the great movement—for I am not at all anxious to be a leader—I am ready to be driven. Who can for a moment remain neutral at the present crisis? Is there a doubt upon the mind of one single Irishman but that the Union was carried by the most profligate means—by force and fraud—by bribery and bloodshed—and by the combination of everything that was base and foul, which rendered the crime of the perpetrators one of the greatest insults and injuries ever inflicted by England upon Ireland? I proclaim this to the people of England, and I turn to the people of Ireland and ask them for support. Who can look around this beautiful island without observing that it contains all the necessaries for forming a nation—all the resources from whence flow prosperity and success—which has been fully shown in that excellent work published upon her 'Industrial Resources' by Professor Kane. Her fertility is beyond that of any other country in the world—her green fields—her fruitful valleys and noble mountains, which pour out their torrents sufficient to turn the machinery of all the manufactories upon the face of the earth—can compete with those of any other country, and why, then, should she not be a nation? Her noble harbours fit to be compared with any in the universe, are neglected and idle, together with all her other internal resources—and what is the cause?—to what is it owing? It is, my friends, owing to the Act of Union; and these evils must continue until that measure is repealed and Irishmen have Ireland for themselves. When this is the state of the country, why do not the men of all religions and political opinions join us? It is said that they refuse to do so from fear lest there should be a religious ascendancy. Now, I tell them that they were never more mistaken in the whole course of their lives, for I am as much opposed to the ascendancy of any party as they are or could be; and if you, Mr. Chairman (addressing Mr. O'Brien) thought so you would not be in your present position—you would not have been working for us the last twelve months. You, Sir, have been twelve long months in our councils in public, and in our committees in private, and you know if one word or one single expression was ever used derogatory to the religion of any man, or that would lead you to think that an ascendancy was the object of Repealers. No, I abhor ascendancy. I never saw any but bad effects resulting from it, and I hate it too much to contaminate my religion with it; still, at the same time that we disclaim it on our own part, we will not let it exist upon the other side. All we want is equal justice—repeal for all, and ascendancy for none. This is our creed—this is our practice—these are our objects. Yet how proud the enemies of Ireland would be if they could insinuate hypocrisy or raise doubts as to our sincerity! We, however, do not care for them; we want no ascendancy ourselves, and we won't let them have it. No; we are struggling for the three greatest blessings that a nation can be honoured with—a free press, freedom of education, and freedom of conscience. These are the terms upon which we invite our friends to join us from the north, south, east, and west, combining the Protestant, Catholic, and Dissenter of every persuasion, in one common bond of nationality. I am aware that I am now repeating what I have often said before, but it becomes necessary that I should do so, for every year, every day, a fresh flow of young Irish blood is coming in amongst us, who must be told the foundation upon which their country's freedom is based. A man generally suspects that he is in error if he requires a bayonet or a constable's staff to confirm his opinions—he thinks they are incapable of being enforced by truth when he considers it necessary to adopt such means; and such is the position of the present Government. Ascendancy I now leave, and will come to another impediment in the way of Repeal—namely, the supposed confiscation of property. I say that property is not safe unless there is a Repeal—and it ought not to be safe when six millions of Irish money is spent out of the country. But, upon the other side, if Repeal were obtained, property would be perfectly secure; therefore it is that men of property should be actively engaged in the struggle; and let me remind them, that an opportunity once lost can seldom be regained. The prosecution, it was said, would put down the agitation—but has it done so, although I and my fellow martyrs were for three months illegally in prison? Certainly not—and by the by, the judgment of the Lords professed to restore us all that we lost. I hope it will do so. I lost three months of my life, and I am entitled to get it back. Lord Chesterfield was once called upon by a London mob to give them back eleven days of their lives, after he had changed the calendar. I have lost more than that; I have lost three months of my life by the Government, and will Sir Robert Peel give it back to me? If not, I call upon every man in Ireland to rally and give me at least an equivalent—a Repeal of the Union—for his having imprisoned seven of Her Majesty's subjects illegally. I forgive them, and you forgive them, and I am sure that the Anti-Repealers of Ireland throughout this country will see that the people who act so must succeed. The members of the Established Church will see it; and the working clergy of that Church, who are the worst paid men upon the face of the earth, shall see it. They also will see every situation worth having in Ireland filled by Englishmen or Scotchmen, which ought not to be the case, and would not be the case if there was a native Legislature. Therefore I call upon all men of all religions to 'agitate! agitate! agitate!' After our victory we are to be more determined. It is every man's duty to consider how he can forward the Repeal cause. Ireland can't tell how long the Union will continue, and it is for those who have influence over the people to guide them in the proper direction. They can answer for it that separation will not come in their time at all events—if such a calamity should ever occur; but who can tell what may happen when death closes around some of us, and time lessens the authority of others? This, then, is the time for Anti-Repealers to come forward. In 1825 the British Minister would have been thanked for emancipation, and it would have been accepted from him as an act of charity: but he refused, and what was the consequence? In 1829 we forced it from them by peaceable and legal agitation. They have also refused us Repeal, and by adopting the same course of policy we shall obtain it. Our plans are fully developed, and all we have now to do is, to rouse the patriotism of Irishmen. Is not Ireland a country worth struggling for? If a foreign foe invaded us, is she not worth fighting for? And if there arose a necessity, is she not a country worth dying for? Oh, my fellow-countrymen, when I look around me and see such an assembly in the body of this hall, and take them as a specimen of the Irish nation, may I not ask if such a people deserve to be free? and when I again look higher, and behold those fairy sylphen forms, fit emblems of the country itself, may I not ask them, are their husbands, fathers, brothers, and sons, to be slaves? These questions may, perhaps, be thought ludicrous by some, but I can tell them they are not; and further, that there is not a man, at least an Irishman in soul, who does not love liberty—and can there be anything more exalting than the love of country, of fatherland, of old Ireland? What pleasure can equal that of contending for one's native land? for a noble people, shrewd to a proverb—temperate to excess—living in as fine a climate as any upon the face of the globe? I tell the tyrants of conscience that they shall not have this country to themselves. The Irish people are entitled by birth to this land, and without depriving any man of his property or liberty they shall become disenthralled and free. Ireland shall be a nation again, united to England by the golden link of the crown, and having the power of legislating for herself, and thereby increased means of prosperity. The day is fast approaching. It cannot be far distant, when I see around me the real representatives of the people from all parts of Ireland—the members of the reformed corporations of Ireland—the honest patriot Smith O'Brien in the chair—and the sacred hierarchy of Ireland. No, it must be at hand. This is a glorious day for Ireland, and in proportion to its importance let us rally for her in every district—in the old and favourable course—paying due obedience and submission to the law. Beloved land, you shall be a nation again—it is decreed that you shall, therefore I call upon Christians of every persuasion to rally with me for old Ireland and Repeal."

Mr. O'Connell sat down amidst tremendous applause from all parts of the hall, which lasted for some minutes. The health of Mr. Smith O'Brien followed, for which the Chairman returned thanks and gave the following toasts:—"The health of the other Liberated Martyrs" (who, excepting Mr. Duffy, severally addressed the company), "Lords Denman, Cottenham, and Campbell," and "The Roman Catholic Hierarchy and Clergy of Ireland," which brought speeches from the Roman Catholic Bishops, Dr. Ffrench, Dr. Higgins, Dr. Cantwell, and Dr. M'Nally. The Rev. T. Maguire, pariah priest of Ballinamore, then delivered a long and humourous speech of a political character, and concluded by proposing "The Protestant Patriots of Ireland." The toast was drunk with enthusiasm, and responded to by Mr. Grattan, M.P., and Mr. C. Powell, M.P. The Lord Mayor having returned thanks, Mr. O'Connell, in giving "The health of Lord Ffrench," explained that the toast had not been given earlier, the committee not being certain that they would have been honoured by his Lordship's presence. Lord Ffrench briefly returned thanks. Some routine toasts were then proposed, and the company did not retire till a late hour.

Repeal Association.—The weekly meeting of the Repeal Association was held on Monday, and was densely crowded, as it was expected that the committee appointed for that purpose would report whether the Clontarf meeting is to be held, and that some further development of Mr. O'Connell's plans for the threatened impeachment of every official connected with the recent prosecutions, and for the assemblage of the Preservative Society in Dublin, would be brought forward. All the leading members of the Association, with the exception of Mr. W. S. O'Brien, who will be absent for some time, were in attendance shortly after 1 o'clock, when Mr. F. Cumming, of Woodstock, ex-Justice of the Peace, was called to the chair. After several subscriptions had been handed in, including some for the Impeachment Fund,

Mr. KELLY, M.P., congratulated the Association on the spirit of inquiry that was abroad, and expressed his conviction that the best results would be derived from it. All agreed that a change would be desirable, but there was a great diversity of opinion as to the means by which this change could be accomplished. Some thought that if the Queen should hold a Parliament in Dublin every three years it might answer the purpose; but, much as he desired to see their Sovereign amongst them, he considered that the carrying out of this proposition would be but a slight alleviation of their diseases. Others were of opinion that a federal Parliament would be the best means of meeting the difficulty; and this party being by far the more numerous, were entitled to the greatest respect. But until the appearance of Mr. Gray Porter's pamphlet they had not put forth their opinions in a tangible shape. Mr. Porter was the son of a Protestant clergyman, and was high Sheriff of Fermanagh, and the sentiments of such a man were entitled to the most serious consideration, and more particularly as it was evident he had the good of his country at heart. The opinions of Mr. Porter were certainly rather indefinite; but he promised that before Christmas he would place them more fully before the public. It was to be regretted that such a production as Mr. Porter's should contain aspersions on the Catholic religion and its ministers; but he would not advert to them, as he was perfectly satisfied that the Catholic religion was beyond the reach of calumny. Mr. Porter had charged the Catholic clergy with a determination to create an ascendancy, but he was sure that had Mr. Porter thought deeply on the subject, or looked into the proceedings of the Association, he would have arrived at a contrary conclusion; or had he attended the late banquet, he would have heard several dignitaries of that church disclaim any such intention. The Association was most anxious to conciliate all parties, and they would therefore pass over the alloy which was contained in Mr. Porter's pamphlet, but they would hold him to his promise of stating his opinions on Federalism. He then congratulated the Association on the re-appearance of Mr. O'Connell amongst them, and rejoiced that the machinations of their enemies had been frustrated. They had hoped to render him emaciated and disheartened, but he would appeal to the meeting whether they ever saw him in better health or more buoyant spirits. Their triumph over judge-made law was most signal, but he considered that the time was not far distant when a far greater triumph awaited them—the realisation of their fondest hopes, the Repeal of the Legislative Union.—Mr. H. GRATTAN, M.P., then addressed the meeting in a very long speech, embracing a very great variety of subjects, and moved that the recent municipal addresses to Mr. O'Connell should be embossed and enrolled among the records of the Association. He denounced the practice of sending Government reporters there, who might omit a word in their reports and bring about an impeachment on his head, and he protested against that course of filling the country with political and police spies. In conclusion, he would promise that the Irish people should sign a bond to tear in pieces the act of their independence, if in seven years' time it could be proved that the country had not increased by self-government; and he then told that meeting that his dying declaration to his children should be, never to be at peace till justice had been done to their country.—Mr. O'CONNELL said, before addressing the meeting on the regular topics of the day, he wished to notice a few matters of minor importance. The first was an omission which he noticed in the report of the grand dinner on Thursday last. The omission was that of the letter of Lord Cloncurry, which had been read by the secretary, and to which he attached much importance. He mentioned the subject because the letter contained one

paragraph which was most important, as being the opinion of that truly patriotic nobleman. It was as follows:—"I beg leave to declare my usual sympathy with my countrymen, and my joy at the most providential escape from the projected massacre at Clontarf, and the projected martyrdom by means of a fraudulent jury." He wished, in the second place, to protest against something which had fallen from his hon. friend the member for Meath, when he spoke of the spy system being employed by Government in procuring the reports of the proceedings of the Association. During the Catholic Association they had Government reporters present at their meetings, and he always found them to act as gentlemen should act. From his own experience of that branch of Government functionaries he could speak highly favourably of them. They attended the committees of the House of Commons, and it was surprising with what rapidity and accuracy they took down the often unconnected answering of the different witnesses. He was always glad to see them present, as he was very sure of having his own speeches accurately taken down. For instance, the report taken by Mr. Ross, at Mullaghmast, was very correct; but he was not equally satisfied at seeing policemen taking notes of their proceedings. In the first place, they were standing in the crowd; secondly, reporting was not their profession; and thirdly, if they happened to be dishonest, they might take down the strong phrases and omit the qualifications, whereas both would appear in the notes of the professional reporters. The third subject he wished to mention was some exceedingly strong observations that had been used by a gentleman whom he much esteemed (Dr. Gray), at the dinner on Thursday night. That gentleman spoke very harshly of England, and spoke of hating the English people, and he wished to protest against such language. He was himself always ready enough to blame the crimes of the people of England, but he could not be silent when such general expressions were made against them—expressions that could only be accounted for by the hurry of a tumultuous moment. He totally disavowed any participation in those expressions, and the Association could have nothing to do with them. He would next proceed to bring the business of the day before the Association. On the last day of meeting, it had been referred to the committee to report whether it was necessary to hold the great meeting at Clontarf, the suppression of which had been described by Lord Cloncurry in the manner that he had read to them. That meeting would only be necessary for the assertion of a great constitutional principle, which no longer required to be vindicated. They insisted on the right of the Queen's subjects to meet in any numbers, no matter how large, for peaceably petitioning the legislature. Lord Althorp, who said he preferred a civil war to granting Repeal, yet with that constitutional justice which was an ingredient in his mind, said —"I will admit that if the great and overwhelming majority of the people of Ireland demand a repeal of the Union they were entitled to have it." He had tried first a Precursor Society; but everything they solicited from England was refused. He then commenced the Repeal Association to call out the people and let the universe know that the people of Ireland demanded Repeal. He made that experiment, and it was perfectly successful. In no other country but Ireland could he have made it. They committed no breach of the peace. Judge Burton, in passing an illegal sentence on him, admitted that his intentions were peaceable, that he had the power to keep the people peaceable, and that in fact they had remained peaceable; but still the Irish judges were unanimously of opinion that those meetings were illegal, though the English judges unanimously pronounced them to be strictly legal. After that unanimous opinion, pronounced by the nine English judges, there was no necessity for them to go farther in vindicating the principle of their right to meet. Were it otherwise, he would be for holding the Clontarf meeting at any risk. He said "at any risk," because though he knew the people would remain peaceable, and go to the meeting unarmed, still if Lord Cloncurry spoke the truth in his letter, there might be an attempt to procure a massacre of them by armed soldiery. The committee had taken these matters into their consideration, and had requested him to report the following resolution for the adoption of the Association:—"Friday, Sept. 20, in committee, Mr. O'Connell moved, that it is the opinion of this committee, that the holding of the meeting at Clontarf in lieu of that illegally prohibited is not necessary for the maintenance of our constitutional principle, namely, the right of the Queen's subjects to hold peaceable meetings in any numbers, however great, for the purposes of petitioning the Crown or Parliament for obtaining legal redress for grievances, having been recognised and established by the unanimous opinions of the English judges."—Seconded by Mr. W. S. O'Brien, and passed.—Mr. O'Connell (in continuation) said that the next topic related to the assembling of the Preservative Society, and the question had been referred to the committee, who had reported that the time had not yet arrived for it, and had asked leave to sit again. He would therefore move that they should have leave to sit again to consider the subject, and that in addition it should be an instruction to the committee to avoid introducing anything which in the smallest way could be construed into illegality. His two propositions therefore were, that further time should be given to consider the nature of the Preservative Society, and that they should avoid the least approach to any violation of the law. Further time was necessary, because the steps to be taken must be considered and entered upon most deliberately. The Association, too, wanted to satisfy every person of the necessity of such a body, which, in its general substance, would be an assemblage of three hundred gentlemen, possessed of 100*l.* each, who might form themselves into a society and enter into negotiations with the ministry of the day for Repeal, and to have the checking and controlling power over all the acts of the Association. Though such was the general plan of the society in theory, it required the greatest caution to carry it into practice, and every step towards its formation should be taken with the greatest deliberation. It was right that people's minds should ripen upon the subject of the difference between the simple absolute Repeal, and the Repeal with a tendency to admit principles of Federalism. There was, he was happy to say, a great growing spirit of nationality in a large portion of the party calling themselves Conservatives. They were beginning to consider the question of the restoration of the Irish Parliament. It was therefore necessary to undeceive the public mind, and make them understand that the Association received Federalist and Repealer alike. There could be no Federalist without the repeal of the Union Act, and that Federalists and Repealers sought alike. They had accordingly, after much deliberation, admitted Federalists, the first of whom had been the Roman Catholic Bishop of Clare, and he hoped to augment their numbers. He was not at all hurt that Mr. Porter had printed his unfounded opinions of Catholicity, for he had been educated in prejudice, some of which he had thrown aside, and for himself he was glad that Mr. Porter had Protestant prejudices, for it showed how strong his convictions were when he became a Federalist. Mr. Porter had written a work on draining; he must now write a book against it, for the country had been drained enough. He the more readily consented to postpone the assemblage of the Preservative Society, in order that he might not anticipate Mr. Porter, who had promised them his scheme by next Christmas; and in the name of the Association, and of the Irish people, he declared his readiness to acquiesce in any plan which could leave the people self-government, and which would do away with the drain of the absenteement. He was of opinion that every Irish absentee should be made to bear his portion in the expenses of the country, unless his absence was caused by ill-health. The hon. gentleman then at some length referred to a passage in the letter of apology for Thursday last sent by Mr. Sharman Crawford, wherein that gentleman expressed his regret that the Repealers had not admitted the federal principle. Now, he agreed with Mr. Crawford in seeking for a representative body for Ireland, competent to manage her resources and protect her rights. That was all he wanted. Mr. Crawford was under a mistake, and he (Mr. O'Connell) told him from that spot that he agreed with him, and would embrace any plan to carry out that object. He cared not by what ear-mark or nickname they might distinguish it, so as it gave Ireland to the Irish. They were ready to admit and join Federalists, and to leave that an open question, and he, for one, could not comprehend what kept Mr. Crawford from joining them. What a delightful moment it would be, when they found Protestant fortune and rank, and Roman Catholic moderation, joining them, and when they found the cry for Repeal spread over universal Ireland. Unanimity, let them remember, was victory—division was defeat. The honourable gentleman having formally moved the resolution for the Preservative Society committee, proceeded to say that he had but a few more words to address to them. On Thursday he intended to go away to his native mountains. He had the pleasure of informing them that his pack was in most excellent order (cheers and laughter). Mr. M. O'Connell would attend at the Association in the absence of himself and of Mr. S. O'Brien. The only remaining topic he had to touch upon was the proposed "impeachment" (great cheering). They sneered at his plan in England. It was always the case. He had never proposed anything but in England they first had laughed at him, and then abused him and it; then they vilified the measure, and himself and its supporters, and finally he carried it (great laughter and cheering). Now he thought it would be impossible for the British Ministry to resist inquiry. They knew it was his intention, if the Association approved of it, to go through England some time before Parliament met, and to state to the English people the groundwork for the impeachment, and then leave them to act for themselves. He would put them in a position to act for themselves, and in full possession of the facts. Mr. S. O'Brien thought that the people of Ireland should not stoop to solicit anything from England, and he (Mr. O'Connell) doubted his own judgment when he found it opposed to that man's, whom he considered one of the greatest blessings ever bestowed on Ireland. He would model his plan to meet his opposition; indeed there could be no variance between Smith O'Brien and himself, for he (Mr. O'Connell) would sacrifice his opinion sooner than such should be the case, unless where some great principle were staked. He anticipated, therefore, the pleasure of that visit, which the people would be prepared for by the publication of a work now nearly ready, detailing all the events of the trial in language technical, yet plain. He would thus then test the English people, and find out whether they would join the English Government or the Irish people. Having enlarged upon the necessity of the impeachment, and on the advantage of his proposed tour, Mr. O'Connell went on—He had been told more than once that the Ministry would resort to some violent means to prevent impeachment. There must then be some consciousness about them that the Irish Government had misconducted itself, and that it could not bear investigation. He would not be surprised at any act of violence, and he ventured to prophecy that some such measure would be taken; but whatever it might be, he told them that it would not tire the Irish people of submission to the law, and that, if consonant to law, it would be obeyed. After some further remarks the hon. gentleman moved that the committee appointed to consider the impeachment should have leave to sit again. He would add one word of advice to the Irish people—to persevere (cheers; "we will"). It was a time to gain golden opinions, and his absence would be painful if he thought they would relax. They had much to contend against—misstatements and lies. The *Globe*, for instance, denied that the rebellion of '98 was fostered by Government in order to effect the Union more easily. He had five witnesses to that fact—Lord Plunkett, Burke, Saurin, Scott, Lord Clonmel, and the fact that Colonel Maquare was in communication for 11 months previously with the Government, and that they knew the abode of every colonel and captain all the time. They had fanned discontent into rebellion; the men of Wexford nearly turned rebellion into a revolution. The Irish people were content that their own church should be supported on the voluntary principle. They had never been guilty of persecution. They had been three times in power since the Reformation, and if a single instance could be shown in which they persecuted Protestants, he would give up the Repeal agitation for ever. There were but two countries in Europe in which persecution was enforced by law, and neither were Catholic countries. A statement had been made at a recent religious meeting at Glasgow, that a woman had been persecuted in the Island of Madeira for leaving the Catholic faith, but on inquiry it was found to be an utterly unfounded rumour. In Sweden, a Protestant country, an eminent artist was recently banished for life for having become a Catholic, but nothing of that nature was witnessed in Catholic countries. There could be no danger, were it even otherwise, of the Catholics persecuting in Ireland, for there would be 99 out of 100 of the Irish House of Peers Protestants, and he was convinced that more than half of an Irish House of Commons would belong to the same persuasion. After again expressing his hope that during his brief absence in the country the business of the Association would be carried on with as much order and energy as if he had continued present, he concluded by reminding them that it was by perseverance and order they could alone expect to succeed, and to see their country again what they all desired her to be, and what Nature intended she should be—

"Great, glorious, and free,
First flower of the earth, first gem of the sea."

The Hon. Mr. HUTCHINSON bore testimony to the observations of Mr. O'Connell with regard to the Irish rebellion. That rebellion, if not planned, was at least fostered by the English Government, and he could state this fact on the authority of his father and uncle, Lord Hutchinson.—Mr. STEELE handed in a sum of money, and said he would take that opportunity of cautioning the executive against receiving reports of meetings furnished by policemen and such characters, which could not by any possibility be correct. If the Government wished for reports let them employ gentlemen, such as his friend Mr. Hodge (the Government reporter), to whose accuracy and fidelity he could bear the strongest testimony.

After some further business had been disposed of, Mr. O'Connell announced the rent for the week to be 600*l.* 12*s.* 6*d.*

Meeting of the Corporation.—A special meeting of the Town Council was held on Wednesday, to consider a proposition of Dr. Maunsell, the terms of which were as follow:—"That an humble address be presented to the Queen, praying that Her Majesty be graciously pleased to hold her Court, and to summon an Imperial Parliament, to meet at least once in every three years, in her loyal city of Dublin. Also that she will recommend to the consideration of Parliament the propriety of making such provision as shall secure that the same be done in future times." The notice of this discussion excited a great deal of interest. In St. Andrew's Ward on Tuesday there was a meeting of the burgesses to consider the question, when, after a great deal of discussion, the proposition was negatived only by the casting vote of the chairman. The assembly-room on Wednesday was well filled at one o'clock. Shortly after that hour Mr. O'Connell made his appearance, and was saluted with a general cheer. The Lord Mayor having taken his seat said he had convened this meeting with great pleasure. He did not mean to say that he approved of the proposition about to be submitted to them. On that point he gave no opinion whatever; but he was delighted that such a proposition was brought forward, as it showed that there was a feeling abroad that some change was called for and generally desired. Dr. Maunsell then rose to bring forward his motion.

He felt that the time was favourable for obtaining from England some moderate measure for the benefit of Ireland. He felt assured that, however strange it might sound in English ears, there never was a period when there was less bitterness of feeling, or more good humour in Ireland, than at present. With that view he had brought forward this motion, and he should avoid drawing comparisons between his proposition and others that might be in agitation. He thought good might be done for Ireland by this proposition. His opinion regarding Repeal was, that it would, if carried, lead to the domination of Popery in Ireland. There were at present in Ireland only two institutions of an exclusively Protestant character—the Church and the University—and, threatened as these were during the last session, no Protestant could consider them safe. Every one has seen the handwriting on the wall against them. A change has been announced in the University, and can any suppose that it will not be one to weaken, not to strengthen, its Protestant character? Any man who has observed the character of the present Government, when pressed from without, will feel convinced that another sop is in preparation to be thrown to the monster of agitation. (A laugh, in which Mr. O'Connell joined.) Now, when the University is surrendered, how long will the Church be safe? There was already a large party of proprietors hankering after the remaining three-fourths of its property. The Church, then, he considered, was in danger—in very great danger. The present Ministry were in the habit of tiding over these dangers, and he had little doubt that if they could tide over but a single session they would, without hesitation, ship both our Protestant University and the Church. He next adverted to the subject of patronage, and asked who were those who now were most favoured by the patronage of the Government? Was it the out-and-out Protestants? or was it not rather the renegade Repealer, or the lukewarm Protestant? These were sops given to the monster of agitation. He hoped Mr. O'Connell would excuse him; but such was the fact. Well, but the time would come when all these sops would be exhausted, and then the time of real struggle for Repeal would have arrived. They might delay the destruction of Protestant institutions, and the consummation of that feeling of dissatisfaction which led Protestants, who were regarded as the garrison of Ireland, to expatriate themselves; but assuredly that time would yet arrive. Was it when Protestant strength was weakened that they were to take up a position in self-defence? Certainly not. They had the best chance of success by now relying on their own resources, and he saw no reason for despair on their part. This was not a Popish country. There were in Ireland the elements of a Protestant nation. The Protestants were in sufficient numbers to arrive at that position, and he trusted they would, confident in their own innate strength and great resources, endeavour to occupy it. He believed the periodical sittings of the Legislature in this country would go far towards Protestantising Ireland. Everything would be transacted before the eyes of Protestants, and they would have an opportunity for watching over their interests and guarding against attacks on their rights and privileges. The Protestant barrister and physician would derive great benefit from the presence in Dublin of the Imperial Legislature. The speculator in railways and other commercial matters, the tenant, the farmer, and the artisan, would all derive especial benefit from the sitting of the Legislature. (Loud cheers from Mr. O'Connell, in which the whole assembly joined.) It was also important to consider what effect the measure would have on the interests of England. Dr. Maunsell then referred to the Rebecca Riots, which he traced to the neglect of their duties by the aristocracy, and quoted the saying of Baron Alderson respecting the intimacy subsisting in a part of England between the landlords and tenantry. They played at cricket together, and the result was that no incendiarism existed in that part of the country. A similar effect would follow from a general and agreeable intercourse between the upper and lower classes in other localities. Rome had been destroyed, and France revolutionised, by the want of this intercourse. Centralisation and bureaucracy were causing incalculable mischiefs in England, which mischiefs the creation of other centres of attraction would effectually cure. There was a plethora of capital at present in England, and moneyed men would, if the Parliament met in Dublin, embark their capital in various Irish commercial speculations. At present the English capitalist was unused to this country, and ignorant of the various ways in which he might profitably invest his capital. Political knowledge of a country could only be obtained on the spot, and by bringing English Members to Ireland they would become better qualified to legislate for the country. He did not think the number of representatives for Ireland insufficient, but if the number was insufficient let it be increased. He was, however, of opinion that the efficiency of the present number might be greatly increased. Those who were sent to Parliament from Ireland did not attend to their duties. The lawyers, certainly, attended because they expected promotion. There were 52 Scotch Members, who clung together for the promotion of the welfare of their country, but the Irish Members were attracted from their Parliamentary duties by dinners and assemblies given by the Opposition. The Irish Members, in fact, wanted to get their wives and daughters introduced into some third rate society, where, in all probability, they were duly laughed at. Irish Members would have greater weight and respectability, and their services would be far more effectual. The third great object sought was to diminish absenteeism. As to the evils of absenteeism, it was obvious that by his measure the absentee would be brought home, and made to reside, with many others, at least once in three years. The Irish business would be done then, and this, perhaps, would suffice for the country. Besides the absenteeism occasioned by attendance in Parliament, there was another arising from attendance at Court, which would also be cured by his measure. As to territorial absenteeism, this also would be greatly diminished—as such absentees might be induced to build houses, and reside here for some time at least. Another sort of absenteeism which utilitarians thought important, was the bringing of the shipowners into this country. On that point it was unnecessary to dilate. The bar to the development of our national resources was the want of capitalists. English capitalists had not sufficient knowledge of the resources of Ireland, nor adequate confidence in the country. If the Parliament sat in Dublin, Englishmen would acquire that confidence and information with their own eyes far better than they possibly could by a commission. An improvement in the economical state of Ireland would lead to an improvement in the social state. A gentleman of his acquaintance once asked, "What will quiet Tipperary?" "Give the labourers 10*d.* a day all round," was the reply. He (Dr. Maunsell) believed that answer contained an important and undeniable truth. The Queen might hold her Court and Parliament wherever she thought proper. An English Parliament had been held in York and Oxford as well as Westminster. The Irish Parliament had been held in Kilkenny and Trim, and even in the potwalloping borough of Swords. The statutes of Merton and Gloucester were not passed in a Parliament sitting at Westminster. There was no charm in that locality to confine the performance of legislative functions to it. This notion was treated as a novelty; but he insisted it was not so. It was moved repeatedly by a Mr. Bish, in Parliament, and had been recommended in *Blackwood's Magazine*, the *Dublin Warder*, and several other periodicals and newspapers. He denied that

there was any impossibility about it, and if we only all agreed that it was possible and feasible it would be done. It was said that the records of Parliament could not be moved about; but he denied that there were any records of Parliament, and, as to any information that might occasionally be called for, it could be obtained by electric telegraph and steam in the course of a very few hours. Such was his case. If his plan were adopted, it would necessarily set aside others, for, if it answered, no other would be required. It had this advantage—that it would be likely to obtain an extent of general concurrence which no other plan, he well knew, would. This country had been marshalled under two hostile armies, who had been halloed to battle to their own gain for the advantage of Lord John Russell and the Whigs—("Don't spare the Whigs" from Mr. O'Connell)—or Sir Robert Peel and the Tories. What had English Whigs or Tories to do with Irishmen? Had those party English feuds done anything to compensate for the injury doneby them to Irish interests? He was persuaded they had not. The great English political parties were now about to be resolved into their original elements. The course of destruction and reproduction in nature showed that when matter was once dissolved it was reproduced in new bodies. The same was true of political bodies. He trusted that if it were only for the novelty of the thing, they would join him in giving a unanimous vote for old Ireland.

Dr. Maunsell concluded amidst loud and long continued cheering from all parties. His motion, however, was not seconded, and the Lord Mayor declared it to be lost for want of a seconder.

Mr. O'CONNELL said: "Before we adjourn on that motion, I would beg leave to say a very few words respecting it. Had the discussion proceeded on the original motion, I certainly would not have availed myself of the opportunity to make what might be called a repeal speech. I think it would be unbecoming in me to do so. I am glad that the learned gentleman has been heard with perfect respect, and that the assembly has extended towards him that attention which was evident in all throughout his speech. He merited that attention and respect from his firm tone, his temper, and his manner. He merited respect from the religious feeling which he exhibited; and as to politics, we nearly agree together. He said nothing throughout his argument to which any one could object, as it is delightful to have even the beginning of a discussion conducted in such a tone and temper. I heard the entire of his speech with unmixed gratification, and in a great portion of it I entirely concur. I think his arguments were all but conclusive, and that they only wanted the proper conclusion to them to render them irresistible. But, above all, I am delighted to perceive that his philosophic mind has ascertained the fact that the elements of society have been shaken in this country from their ancient state, and that a new combination has now become essentially necessary; may that combination be founded in benevolence, and originate in feelings of philanthropy towards each other, all of us recollecting that though there are many roads to heaven by which each of us may travel, there is but one road that leads to the political salvation of Ireland, and that that road ought to be trodden by all Irishmen of every religious belief. I believe recent events warrant me in saying that there has been none of the insolence of triumph witnessed after the recent victory of the popular party, and that greater moderation has, perhaps, been exhibited than might be expected in an hour of greater strength, and of greater defiance on the part of our opponents. I hope that spirit will go forth throughout the land, and that all idea of our being satisfied with those things called 'sops,' will be given up. I can recognise my own title in what the learned doctor said about the 'monster of agitation,' and I can assure him that, as far as I am concerned, I have no inclination whatever to have 'sops' prescribed for me. As for the sop of the University of Dublin, I can only assure him that I would be sorry to see any alteration in it by which its utility would be lessened in any way, or the property belonging to it endangered. I have the honour to be a tenant under the university, and they are very good landlords; but I do think that it would not be an injury to the university if the number of those who attend its lectures, and to whom its honours are open, were augmented; and if the number of fellowships were increased with the increasing demand for education that will exist among the gentry of Ireland; and if in that University, while the Protestant theological department was kept perfectly independent and untouched, for the use of the Protestant population of the land, a door were to be thrown open, that would leave every other department of literature and science to be shared equally by Irishmen of all persuasions. As to the Church, I have never concealed my sentiments. I do not wish that there should be any Church establishment in connection with the state; but I would rather perish on the scaffold than be the means of depriving any one individual of the interest vested in him. At the same time I think that no Protestant should be apprehensive for the stability of his religion, because it would be deprived of state support. Let him look to the Roman Catholic faith. We have preserved our hierarchy against all the emaciating cruelty of the penal code. Surely you who think Catholicism an error and Protestanism truth should not be afraid of leaving your religion open, not to persecution, for that can never occur—but on that scriptural authority on which you say it stands. You cannot fear that Protestant truth is not as well able to buffet the storm of neglect of the State, for that is all that you can fear, as the faith that is professed by the majority of the Irish people. I am glad that the learned Doctor has put his objections on religious grounds, though it is difficult to deal with such arguments, as, if a man of confused notions happens to take an erroneous view, it is likely that he will be doubly erroneous on that point. But it is delightful that we should come to a community of sentiment on political matters. It is clear that things cannot remain as they are. There must be a change, and God forbid that that change could be effected without the consent of men of all religions. I would consider that change not a blessing, but a curse, if it were forced on any portion of the Irish people. Every hour tells me that other combinations are about being formed. They shall be met by me half way, or more than half way, to restore those advantages to Ireland which the learned Doctor would give us but once in three years, but which I would be for having every year. When that spirit extends farther abroad—and I believe it is working to its manifestation, and will appear in the course of a few weeks—it will totally defeat religious partisanship, combining all in love of our common country. I move that the assembly do now adjourn."

The motion was put and carried, and the meeting adjourned.

Belfast.—The Irish General Assembly have determined to separate from the Belfast Academical Institution, and to set on foot a college of their own for the education of their clergy. For some time past there have been differences between the Orthodox Presbyterians and the Unitarians, respecting the management of the Belfast Institution, which receives a Parliamentary grant.

Mayo.—A policeman arrived at Huddersfield a few days since, and apprehended an Irishman, named John Ennis, *alias* Black Jack, on a charge of murder, committed by him, along with three other persons, on a farmer in this county, so long ago as 1838. The discovery of Ennis occurred through one of his letters, addressed to his wife, who recently died, having reached the dead letter-office, where it was opened.

Londonderry.—A dinner has been given in Londonderry to Sir Robert and Lady Sale, when upwards of 180 sat down. The mayor occupied the chair, and was supported by a number of the clergy and gentry of the county. A variety of toasts were given and responded to, and the entertainment passed of with much *éclat*.

SCOTLAND.

Edinburgh.—The Scotch papers are unanimous in their reprobation of a letter addressed by Sir Andrew Agnew to Lord Aberdeen, containing a lecture to the Queen upon the mode in which she should spend the Sabbath in Scotland, which he describes as "a strict Sabbath-observing country, in the true scriptural sense of the word." The letter deals in the free and familiar use of holy names and references, and in one place it presumes to pray that "the Sabbath may be a sign between God and Her Majesty, whereby Her Majesty may know that He is the Lord her God." The *Scotsman* designates the writer as a "Pharisaical coxcomb," and says, "We shall next have the Total Abstinence Society, we presume, forwarding an Address to Her Majesty inculcating habits of temperance! The one we are sure would be as appropriate as the other."

Montrose.—The local papers state that Mr. W. Dorward, of this town, has recently given 2000*l.* towards the endowment of the Trades Schools of Montrose, which will henceforth bear the name of Dorward's Seminary.

Tongue.—On Monday week a boat belonging to Her Majesty's cutter Sparrow, Commander Otter (at present stationed at Sutherlandshire on the Government survey), having on board Dr. Black, from this place, who had been visiting one of the men who had received some injury on board the vessel, Mr. Tweeddale, purser, and three sailors, when about half way up the Frith, was upset by a squall, and all on board were thrown into the water. They managed to get upon the keel of the boat, and remained there, according to the survivors, for two hours. The tide having drifted the boat towards a sand bank, the mast struck on it, when they were again thrown into the waves. Mr. Tweeddale and two of the sailors sank to rise no more, but Dr. Black and the remaining sailor held on for some time by the boat, and then swam in the direction of the shore, which they gained in a greatly exhausted state, near Melnest. They swam, it is supposed, half the breadth of the Frith. The bodies of those who perished were found, and interred in the churchyard of Tongue.

SPORTING.

DONCASTER RACES, concluded.—*Friday.—Scarborough Stakes* of 30 sovs each, 20 ft, for three-year-old colts, 8st 7lb; fillies, 8st 4lb. 5 Subs. Mr. Salvin's the Cure beat Mr. Smallwood's Prince Royal, and Mr. W. S. Standish's Susan. Won in a canter. —*Match*, 1000 sovs. St. Leger Course. Mr. Irwin's Foigh-a-Ballagh, 3 yrs, 7st, beat Mr. Collett's Corranna, 5 yrs, 9st, in a canter by six lengths.—*Park Hill Stakes* of 50 sovs each, h ft, for three-year-old fillies, 8st 7lb each; second to receive 100 sovs; winner to pay 20*l.* towards expenses. 31 Subs. Mr. Osbaldeston's Sorella beat Colonel Anson's Princess, Mr. Irwin's Pride of Kildare, Lord G. Bentinck's All-round-my-Hat, and Lord Chesterfield's Joan of Arc. Won cleverly by a length.—*Match*, 300 sovs each, Red House in. Lord G. Bentinck's br f Longitude for. rec. from Lord Glasgow's b f Sister to Deerslayer.—*Match*, 100, h ft. Two miles. Mr. Collett's Corranna, 5 yrs, 8st 10lb. against Mr. H. Johnstone's William le Gros, 5 yrs, 8st. Off by consent.—*Town Plate* of 100*l.*, for 3 yrs old, 7st 2lb: and 4 yrs, 8st 7lb; fillies and geldings allowed 3lb, and maiden horses, 3lb. Heats, miles. The following ran:—Mr. Irwin's Mickey Free, 3 yrs, Mr. Meiklam's True Boy, 4 yrs., Lord Chesterfield's Parthian, 4 yrs, Captain Boyd's Dog Billy, 3 yrs, and Sir R. Gill's Corodino, 3 yrs. 1st heat, Trueboy won easily by 2 lengths, Corodino second. 2d heat, Parthian won by a length, Dog Billy second. 3d heat, Mickey Free won in a canter by 6 lengths, Parthian second, Trueboy third, the others drawn. 4th heat, Mickey Free won by 2 lengths, Trueboy second.

BIRTHS.—19th inst., the lady of the late Major C. B. BRISBANE, late of Her Majesty's 34th Regiment, of a son—19th inst., in Half-moon-street, the lady of G. T. ELLISON, Esq., of a daughter—21st inst., at Beacon-hill, the lady of E. S. GOOD, Esq., of a daughter—22d inst., at the Rectory, Fledborough, Notts, the lady of the Rev. A. FITZGERALD, of a son—22d inst., at Brighton, the lady of C. BURNETT, Esq., of a son—23d inst., at Ipswich, the lady of J. H. T. WARDE, Esq., 4th Light Drags., of a son—Recently, at Dinshill-house, near Ledbury, the lady of the Rev. J. LANDER, of a son, still-born—23d inst., at 118, Albany-street, Regent's Park, Mrs. W. HAMPTON, of a son—23d inst., at Notting-hill, the lady of F. W. MEDLEY, Esq., of a daughter—23d inst., at Norwood-lodge, Surrey, Mrs. J. MAUDSLAY, of a son—24th inst., in Grosvenor-square, the Hon. Mrs. C. STANLEY, of a daughter.

MARRIAGES.—19th inst., at St. Nicholas Church, Brighton, J. F. HAFFNER, Esq., to CLARISSA A. HINSON, only daughter of Mr. W. Hinson, of Norfolk-square, Brighton—21st inst., at St. Mark's Church, Pentonville, W. H. COOK, eldest son of Mr. Cook, of Baker-street, to ANNE MURRALL, second daughter of the late Mr. Murrall—23d inst., at St. Luke's Church, Chelsea, S. ARCHBUTT, second son of S. Archbutt, Esq., of Oakley-square, Chelsea, to ANNE CLARKE, of Blacklands-house, Chelsea—24th inst., at the parish church, St. Marylebone, H. TUFNELL, Esq., M.P, to the Hon. FRANCES BYNG, second daughter of General Lord Strafford, G.C.B., and niece to G. Byng, Esq., M.P. for Middlesex—24th inst., by special licence, at the chapel of St. Mark's College, Chelsea, the Rev. E. W. EDGELL, Rector of North Cray, Kent, to the Hon. H. O. CAVE, youngest daughter of the Baroness Braye and the late H. Otway, Esq., of Stanford-hall, Leicestershire.

DEATHS.—17th inst., at Shandwick-place, Edinburgh, MARGARET HONYMAN, daughter of the late Sir William Honyman, of Armadale and Graemsay, Bart.—18th inst., at her house at Burdon, near Darlington, in the county of Durham, MARGARET WALDY, relict of the late J. Waldy, Esq., of Yarm, in the county of York, aged 83—19th inst., at Dover, Major C. B. BRISBANE, late of Her Majesty's 34th Regiment, eldest son of the late Admiral Sir C. Brisbane, K.C.B., Governor of St. Vincent—19th inst., at Vevey, Canton de Vaud, Switzerland, after a short illness, N. DUNN, Esq., the proprietor of the Chinese Collection, and late of Philadelphia—20th inst., in Park-lane, LUCY ELIZABETH, Countess Dowager of Bradford—21st inst., after a week's illness, J. BURT, Esq., surgeon, the only son of G. Burt, Esq., surgeon, 7, Crescent-place, New Bridge-street, Blackfriars, aged 24—21st inst., at Richmond-hill, Capt. M. SMITH, R.N., aged 76—21st inst., at 39, Lower Belgrave-street, THOMAS CLEEVE, eldest son of the late W. T. Cleeve, Esq., of Wisbech, aged 19—23d inst., LADY ELLEN, wife of J. W. FANE, Esq., of Shirborn-lodge, Oxfordshire, and daughter of the Earl of Macclesfield.

SIX POUNDS OF TEA, whether Black or Green, for 17*s.*; and small bright Gunpowder, in 12-lb. boxes, at 4*s.* 6*d.* per lb. East India Tea Company's Offices, 9, Great St. Helen's Churchyard, Bishopsgate-street.

TERRA COTTA FIGURES, VASES, FOUNTAINS, &c. Manufactured by DOULTON and WATTS, LAMBETH POTTERY, High-street, Lambeth, London.

D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, the superiority of which over Artificial Stone or Cement is well known. It is subjected to a high degree of fire, which renders it imperishable, and gives it a sharpness and surface which no changes of temperature can impair.

D. and W. are enabled to offer the Terra Cotta at a considerable reduction in price; and Drawings and Designs will be forwarded Gratis, on application.—Architectural work executed.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June 6*, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

WANTED, within eight miles westward of Hyde Park Corner, a PIECE OF GARDEN GROUND, fronting the high road, consisting of not less than 2, or more than 10 acres. If Rent and Terms are reasonable, with a small respectable Cottage on the ground, the Advertiser would be willing to take a lease. Direct, post-paid, to Mr. SHUTER, solicitor, 67, Millbank-street, Westminster.

WANTED.—A GARDENER by a Gentleman in Berkshire. Wages 1*l.* per week, and the use of a Cottage. Apply for the place by letter, prepaid, to A.B.C., Post-office, Reading. The letter must state Applicant's name, and age, and circumstances, and the different engagements which have been held by him during the last six years, as well as the names and addresses of respectable persons who will vouch for his thorough integrity, general good conduct, and skill in his profession. No Dissenter need apply.

WANTED, a PARTNER in the Nursery and Seed Business.—A respectable young Man, 32 years of age, who has been in the above business from his youth, and for some time as an improver in a London Nursery, has attained a thorough practical knowledge of every department. He has at present a small share in a country Nursery, from which he intends to withdraw in a few months, when he will have 400*l.* at his disposal; he is desirous of meeting with a Partner who can command the same amount, or more; if more, satisfactory arrangements could be made. The Advertiser would have no objection to join an established concern, where an active Partner is required. References as to character, &c., of the highest respectability, can be given.—Direct to S. B., at the Office of this Paper.

WANTED, by a Gentleman in Devonshire, a first-rate WORKING BAILIFF, to superintend a Farm of about 300 acres. He must be thoroughly acquainted with the improved husbandry of the present day, and must have his employer's interests as much at heart as his own; be able to write a good hand; be correct in his accounts; a judge of cattle, both in buying and selling; of honest character, and of sober and industrious habits. A married man, with a wife competent to take charge of a Dairy and Poultry is required. An excellent house, with garden-ground, and wood for firing will be provided. Should this Advertisement meet the eye of one who can bring an unexceptionable character from his last employer, he may apply by letter, pre-paid, to J. L. TEMPLER, Esq., Torr Hill Cottage, Ivybridge, Devon.

WANT PLACES.—All Letters to be post-paid.

AS HEAD-GARDENER.—A Married Man, aged 31, who is conversant with gardening in all its branches, and is leaving his situation in consequence of the death of the nobleman with whom he lived. Satisfactory references will be given as to character, &c.—Direct to Messrs. FAIRBAIRN, Clapham, near London, or to Mr. WILLIAM BAXTER, Huntingfield, near Yoxford, Suffolk.

AS GARDENER.—An active, industrious, married Man, who is conversant with the thorough management of Hothouse and Greenhouse, Kitchen, Fruit, and Flower-Garden, and every branch of the business; and can have an undeniable character.—Direct to Messrs. WM. WOOD and SON, Nurserymen, Maresfield, near Uckfield, Sussex.

AS GARDENER.—A married Man, aged 30, with one child, who perfectly understands all Forcing Departments, Flower and Kitchen Garden, and has been Foreman in a Nobleman's Garden seven years; can have a good character from the situation he has lived in two years as Head Gardener.—Direct to J. B., Post-office, Chislehurst, Kent.

AS GARDENER.—A young Man, 24 years of age, who has a perfect knowledge of his business in all its various branches; also understands the management of horses. Can have two years' unexceptionable character from the situation he has just left. No objection to town or country.—Direct to A. B., Post-office, Battersea, Surrey.

AS GARDENER.—A Married Man, aged 29, who perfectly understands his business in all its branches, including Pines, Vines, and Greenhouse plants. Is a native of North Britain. Can have a good character from the family he lately left.—Direct to G. R., Westbourne Lodge, Harrow-road, near London.

AS GARDENER in a Gentleman's Family, or UNDER-GARDENER in a Large Establishment.—A respectable young Man, aged 26, who can undertake Kitchen and Flower-garden and Forcing in the general way. He is leaving his situation in consequence of the death of his late employer. Can be highly recommended.—Direct to P. S., 115, Curtain-road, Shoreditch.

AS UNDER-GARDENER in a LARGE ESTABLISHMENT.—A respectable young Man, 23 years of age, who has lived in several establishments, and can have a two years' good character from the gentleman he has just left. A premium will be given, if required.—Direct to A. B., care of Mr. Austin, Gardener, Beddington Park, Surrey.

A YOUNG MAN, 24 years of age, who has been brought up to the Nursery and Seed Business, wishes to meet with a Situation in a Seed-shop, where he could obtain a further knowledge of the Business. No salary would be required for the first year. Respectable reference and security can be given.—Direct to H. M., Office this Paper.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

GARDENERS' BENEVOLENT INSTITUTION.—NOTICE IS HEREBY GIVEN that an Election for FOUR PENSIONERS on the Funds of this Institution will take place on WEDNESDAY, 22d Jan. next. All persons desirous of becoming Candidates are requested to send in their Testimonials, &c. on or before FRIDAY, 1st Nov. next, after which time they will not be received.

Printed Forms may be had on application to E. R. CUTLER, Secretary, 97, Farringdon-street.

UNIVERSITY COLLEGE, LONDON.—Faculty of Arts and Laws, Session 1844-45.—The SESSION will COMMENCE on Tuesday, October 15, when Professor MALDEN will deliver an INTRODUCTORY LECTURE at Two o'clock precisely.

CLASSES.

LATIN.—Professor LONG, A.M.

GREEK.—Professor MALDEN, A.M.

HEBREW.—A Professor will be appointed before the opening of the Session.

ORIENTAL LANGUAGES.—Professor FALCONER, A.M.

ENGLISH LANGUAGE and LITERATURE. — Professor LATHAM, A.M.

FRENCH LANGUAGE and LITERATURE. — Professor MERLET.

ITALIAN LANGUAGE and LITERATURE. — Professor PEPOLI.

SPANISH LANGUAGE.—Teacher, Mr. GIL DE TEJADA.

GERMAN LANGUAGE.—Teacher, Mr. WITTICH.

COMPARATIVE GRAMMAR.—Professor KEY, A.M.

MATHEMATICS.—Professor DE MORGAN.

NATURAL PHILOSOPHY and ASTRONOMY.—Professor POTTER, A.M.

CHEMISTRY.—Professor GRAHAM.

ARCHITECTURE.—Professor DONALDSON.

GEOLOGY.—Professor WEBSTER, F.G.S.

DRAWING, in ALL its BRANCHES.—Teacher, Mr. MOORE.

BOTANY.—Professor LINDLEY, Ph.D.

ZOOLOGY, RECENT and FOSSIL.—Professor GRANT, M.D.

PHILOSOPHY of MIND and LOGIC.—Professor the Rev. J. HOPPUS, Ph.D.

ANCIENT and MODERN HISTORY—Professor CREASY, A.M.

LAW.—Professor CAREY, A.M.

JURISPRUDENCE.—Professor HARGREAVE, B.L.

Residence of Students.—Several of the Professors and some of the Masters of the Junior School, receive Students to reside with them, and in the Office of the College there is kept a register of parties unconnected with the College who receive boarders into their families—among these are several medical gentlemen. The register will contain references as to respectability, terms and other particulars.

FLAHERTY SCHOLARSHIPS.

Flaherty Scholarships of 45*l*. per annum will be awarded in the Session 1844-45, by Examiners to be appointed by the Council, to the best proficients among the Students of the College of two years' standing, under the age of 21 years, as follows:—A scholarship, tenable for four years, in Mathematics and Natural Philosophy, and an Extraordinary Scholarship, tenable for three years in Classics. The examination will take place between the 7th and 15th of January. A Scholarship will be awarded in January, 1846, for Classics, and in January, 1847, for Mathematics. Printed copies of the Regulations concerning these Scholarships may be had on application at the Office.

Prospectuses and further particulars may be obtained at the Office of the College.

Oct. 1844. P. S. CAREY, Dean of the Faculty.
CHAS. C. ATKINSON, Secretary to the Council.

BAGSHOT NURSERY (late HAMMOND'S).

GEORGE BAKER, late of Knap-hill, has to inform his Friends and the Public, that, under an agreement entered into in July last, he has become the tenant of the Bagshot Nursery Grounds, formerly for many years occupied by Mr HENRY HAMMOND. Mr. BAKER is adding considerably to the stock, rendering it superior in quality and of greater variety than has hitherto been kept at this Nursery. All letters addressed to Mr. BAKER, Bagshot Nursery, Surrey, will be punctually attended to.

HAMILTON'S CELEBRATED BLACK SPINE CUCUMBER—never before sent out. Seven good Seeds sent postage-free on receiving a post office order of 5*s*. Has the last three years taken 10 first prizes in the vicinity of Manchester and Stockport—has completely outstripped all the most recent varieties. Length exhibited—24 to 28 inches in pots; same in dung-pit and frame. Also his TREATISE on the PINE-APPLE, GRAPE, and CUCUMBER. An annual crop of splendid Pines cut from the same plants at a trifling expense. Price 6*s*. May both be had of Mr. T. Wild, Three Tavern-street, Ipswich; J. Hamilton, Thornfield, Stockport; or Mr. J. Masters, Publisher, 33, Aldersgate-street, London.—Oct. 3.

SPLENDID NEW HEAVY-EDGED PURPLE PICOTEE, WOOD'S "PRINCESS ALICE."

JOHN WOOD begs to announce that the stock of this superb flower is now ready for sale at 15*s*. per pair, postage included. It has gained the following prizes:—At Cambridge Florists' Show, 1843, it was the 1st seedling, and the 1st heavy-edged purple; at the same Show, in 1844, it took the premium prize, beating all the Picotees exhibited. At Huntingdon, 1843, it was 1st seedling and 1st purple Picotee; at the same place, 1844, it was 1st, 2d, 3d, and 4th, excluding every other flower. At Peterborough, 1843, it was the 1st seedling, took 1st pair of purple, and was in the best stand of six Picotees; in 1844, at the same Show, it took the 1st pair, and was again in the 1st stand of six.

J. W. flatters himself that this statement precludes the necessity of farther comment. Plants of the above may also be had of HURST and M'MULLEN, 6, Leadenhall-street.

J. W. has a few pairs of that splendid Pink, Garratt's "Queen of Roses," for sale, at 7*s*. 6*d*. per pair; his Catalogue of Carnations, Picotees, &c., may also be had on prepaid application; and those about to commence growing, he will supply as follows, if left to his selection.

CARNATIONS AND PICOTEES.

N.B.—Remittances must accompany the orders of unknown correspondents.—Nursery, Huntingdon.

GERANIUM "CELESTIAL."

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, have now ready to send out young plants of their New Geranium "CELESTIAL," which has been so much admired. The flowers being very large, and with a beautiful white throat, it is one of the most conspicuous varieties that has yet been raised. Plants, 10*s*. 6*d*. each.

C. and Sons have also to offer healthy young plants of CAMELLIAS of sorts, with flower-buds, at 30*s*. per dozen; larger plants 42*s*. per dozen; and good plants of the newer sorts 60*s*. per dozen. Also good plants of the best sorts of CHRYSANTHEMUMS, at 12*s*. per dozen; larger plants, 18*s*. per dozen. The package included in the above prices. A remittance or reference for payment in London will be expected from unknown correspondents.

INGA PULCHERRIMA. (Figured in "Paxton's Magazine of Botany" for August, 1844.)—Fine Plants of this extremely elegant and beautiful Exotic, with most of the other new and rare Plants of the season, may be obtained of the undersigned, at the following low prices:—

Inga pulcherrima, 7*s*. 6*d*.
Achimenes picta, 10*s*. 6*d*.
Æschynanthus Horsfieldii, 7*s* 6*d*
Amycia zygomeris, 7*s*. 6*d*.
Clerodendron splendens, 10*s*. 6*d*
,, squamatum, 5*s*.
Hindsia, or Rondeletia longiflora, 15*s*.
Epacris campanulata rosea (the finest selected from 1000 seedlings), 7*s*. 6*d*.
Habrothamnus elegans, 15*s*.
Tremandra Hugelii, 10*s*. 6*d*. to 21*s*.
Veronica speciosa, 5*s*. to 15*s*.
Erica elegans, fine and healthy, 15*s*., 24*s*., and 30*s*. per doz.
Drymonia punctata, 3*s*. 6*d*.
Phlox Van Houttei, (flowering plants), 2*s*.
Spirea Reevesiana, 5*s*.
Viburnum cotonifolium, 3*s*. 6*d*.

Also the following, in collections:

100 Cape Ericas of 100 distinct sorts, (including many fine sorts) 5*l*.
12 Epacrises of 12 distinct sorts, (including Campanulata rosea) 21*s*.
12 Azalea indica, of 12 distinct sorts, (including fulgens) 21*s*.

THOMAS JACKSON, Kingston Nursery, Surrey, Oct. 4.

NEW PLANTS.

MESSRS. VEITCH AND SON have now ready for sending out the two undermentioned beautiful New Plants, viz.:—

HINDSIA VIOLACEA. Strong plants at 63*s*. It is figured by Dr. LINDLEY, in the "Botanical Register" for August last, who there says—"The Hindsia violacea is one of the finest things obtained from South Brazil. It has been imported by Messrs. Veitch and Son, of Exeter, who received for it the Large Silver Medal at the Horticultural Society's Garden Exhibition in May last. It will doubtless prove a very easily cultivated Greenhouse Plant; and is certainly unsurpassed in beauty by blue-flowering shrubs."

CLITORIA FULGENS. Strong plants at 42*s*. This plant was exhibited at Chiswick, in May, under the name of Centrosema species, and received the Knightian Medal. See Report in *Gardeners' Chronicle* for May 25. It is figured in "Paxton's Magazine" for July last.

Messrs. V. and Son have also to offer the following fine plants, viz.:—

Achimenes picta
Allemanda grandiflora
Barbacena squamata Veitchia
Clerodendron lævifolium
,, splendens
Cyrtoceras reflexa
Echites atropurpurea
,, hirsuta
,, splendens
Gardenia Rothmannia
Gardenia Sherbournea
,, tetrasperma
Gesneria polyantha
Gloxinia Cartonii
Hindsia longiflora
Inga pulcherrima
Luxemburgia ciliosa
Passiflora actinea
Pentas carnea
Thunbergia chrysops, &c. &c.

N.B.—Messrs. V. and Son's General Catalogue can be had on application.—Exeter, Oct. 4, 1844.

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may be had at the Nursery, and of Messrs. WARNER & WARNER, Cornhill, London, after the 7th September.

TO FLORISTS, NURSERYMEN, &c. &c.

WANTED to House, in the vicinity of London, for the Winter, a few ORANGE PLANTS. Direct post-paid, with lowest terms, and all particulars, A. C., 16, Pall Mall.

NEW AND VALUABLE PLANTS.

R. GLENDINNING respectfully begs to offer the following very desirable Plants:—

CLERODENDRON INFORTUNATUM, 42*s*.—This is by far the finest species of this genus yet introduced, a plant of which was exhibited by R. G. at the Chiswick Show, in June last, and awarded the Large Silver Medal as a New Plant. It flowers freely in a dwarf state, and will remain in flower in a cool greenhouse six months. It is figured by Dr. Lindley, in the "Botanical Register" for April, and in "Paxton's Magazine of Botany" for August last.

Achimenes picta, 7*s*. 6*d*.
Budleya Lindleyana, 7*s*. 6*d*.
Barnardesia spinosa, 10*s*. 6*d*.
Correæa Goodei, 3*s*. 6*d*.
Clerodendron splendens, 5*s*.
,, lævifolium, 5*s*.
Cyrtoceras reflexa, 10*s*. 6*d*.
Echites splendens, 42*s*.
,, hirsuta, 5*s*.
,, atropurpurea, 7*s*. 6*d*.
Gardenia Rothmanni, 5*s*.
,, Sherbournæa, 42*s*.
Gesneria macrochiza, 10*s*. 6*d*.
*Gloxinia Cartoni, 5*s*.
,, magniflora, 5*s*.
,, bicolor, 5*s*.
Gonolobus hirsutus, 42*s*.
Hindsia longiflora, 7*s*. 6*d*.
Jasminum Bidwellianum, 5*s*.
Lasiandra cautiniana, 10*s*. 6*d*.
Pentas carnea, 2*s*. 6*d*.
Physianthus aurocomus, 42*s*.; the flowers of this creeper are as large as Stephanotus, of a creamy-white colour, and sweet-scented.
Portlandia grandiflora, 10*s*. 6*d*.
Rondeletia, 42*s*.; a most beautiful new species, with long yellow flowers, from Havanna.
Taxonia molissima, 5*s*.

* See the "Botanical Register" for August last, in which these are figured.

Chiswick Nursery, near London, October 1, 1844.

DOUBLE ROMAN and PAPER-WHITE NARCISSUS, 4*s*. per dozen. The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. COBBETT'S, late MR. BARRON'S, Italian and Foreign Warehouse, 19, Pall Mall. Also Dutch Hyacinths, Crocus, Tulips, Anemones, &c. &c. Price Catalogues of which may be had per Post.

THE GREATEST NOVELTY EVER OFFERED TO THE PUBLIC.

RHODODENDRON JACKSONII.—This splendid new hardy Rhododendron is confidently recommended as the most beautiful variety extant; it surpasses in the colours of its flowers the richest Geranium, and is quite a new feature in this noble family. It forces well, is a free blooner, and of dwarf habit. A truss of flowers was transmitted to Dr. Lindley, who pronounced it "a very compact and handsome variety," with "great richness" in its general appearance, &c. See *Chronicle* of the 6th April last, page 216, "*Rhododendron.—C. L. N.*" To be sent out in March at 10*s*. 6*d*. each.

WM. JACKSON and Co. beg also to call the attention of the Nobility, Gentry, and the Trade to the following rare and valuable Rhododendrons, all warranted true, at the very low prices attached. The plants are from seed, fine and stout, twice transplanted.

Rhododendron campanulatum, averaging 1 inch, 3*l*. per 100.

HYBRIDS

Between R. campanulatum and the scarlet arborea, 2 in., 3*l*. p. 100
,, ,, and R. venustum, 1 inch . 2*l*. ,,
,, ,, ,, maximum . . 3*l*. ,,
,, ,, ,, nivaticum, 1 inch . 7*l*. 10*s*. ,,
,, ,, ,, Catawbiense, 1 inch 7*l*. 10*s*. ,,

Usual Discount to the Trade on the above.

Cineraria Celestial, No. 1, 2*s*. 6*d*. each; do. Fairy, No. 2, 2*s*. 6*d*. each; fine plants well established. See Dr. Lindley's opinion in the *Gardeners' Chronicle* of April 6th, page 215, under the letters "*C. L. N.*," and Advertisement of Aug. 24th.

WM. J. and Co. take this opportunity of stating that in consequence of the great success they have had in propagating the above beautiful Cinerarias, they have reduced the price, which will be applicable to all who have already favoured them with their orders, which will be executed next month, and plants given to compensate for long carriage.

Their new Catalogue is now ready (in which is a list of their fine white and scarlet Rhododendrons), and may be had on application. A remittance or reference will be expected from unknown correspondents.

Agents in London: Messrs. WHITLEY and OSBORN, Fulham Nursery, who have seen the plants.

Cross Lanes Nursery, near Bedale, Yorkshire, Oct. 4.

TULIPS, HYACINTHS, RANUNCULUSES, ANEMONES, GERANIUMS, AURICULAS, CARNATIONS, and LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment FLORIST TO HER MAJESTY, begs to recommend to the attention of the Nobility, Gentry, and Public his extensive assortment of the above Flowers, which, from the success he has had in their cultivation, he can offer at very moderate prices. He particularly wishes to call attention to the highly-flattering remarks on his Exhibitions of Tulips and Lilium lancifolium this season, in the various papers. He is also desirous of reminding the Nobility, Gentry, and Amateurs, who may wish to add to their collections or ornament their parterres with these beautiful flowers, that this is the best season to make a selection. The varieties of the splendid Lilium lancifolium are particularly adapted for parterres, as, besides being quite hardy, they flower at a time when the Nobility and Gentry are at their country seats, and when flowers are so much wanted. They only require to be known to be universally cultivated. Catalogues can be forwarded by post on application. Foreign orders executed.

CARNATIONS, PICOTEES, PINKS, AURICULAS, ALPINES, AND POLYANTHUS.

JOHN HOLLAND, FLORIST, &c., Market-place, Middleton, near Manchester, Lancashire, respectfully informs his Friends and the Floricultural Public that his extensive and choice collection of the above Florists' Flowers are now ready for sending out, Catalogues of which are now ready, and may be had on prepaid application.

Market-place, Middleton, October 4.

TULIPS.—To be disposed of for £6, a BED OF TULIPS, of 17 Rows, with their Offsets, in three drawers; an equal quantity of Bizarres, Rubiemens, and Roses, well-arranged and true to name, such as Polyphemus, Cerise belle forme, Charbonnier, &c. Apply to EDWARD WOODTHORP, Purfleet, near Romford, Essex.

LILIUM LANCIFOLIUM. — Flowering Bulbs of these most beautiful LILIES to be had at the following low prices: Lancifolium album . . 5s. each.
" punctatum . 5s. "
" speciosum . 25s. "
of W. J. Nutting, Seedsman, 46, Cheapside, London.
Seed from the best varieties of IXIAS and SPARAXIS, at 2s. 6d. per packet.

CAMELLIA JAPONICA.

ROBERT LAWSON, Esq., of Tiverton, intends disposing of his stock of Camellias, which he has collected at much expense, and successfully cultivated for many years. They are in the highest state of health, and most abundantly set with blooming buds. Mr. L. disposes of them solely in consequence of their having become too large for his conservatory. They are as follow:—

			£	s.	d.
Reticulata,	from 7 to 8 feet in height, a very fine specimen, quite healthy and green	. . . .	10	10	0
Imbricata,	from 7 to 8 feet in height,	do. .	8	8	0
"	" 3 to 4 "	. . .	1	10	0
Reticulata	" 7 to 8 "	a magnificent plant	7	7	0
Conchifolia	" 6 to 7 "	a fine plant	5	5	0
"	" 3 to 4 "	. . .	1	10	0
Lady Hume's Blush	6 to 7 "	. fine	4	4	0
Double White	6 "	. . .	5	5	0
" "	5 to 6 "	. . .	3	10	0
"	5 "	. . .	2	10	0
Invincible (Gray's)	5 to 6 "	. . .	3	3	0
Bealii	" 4 to 5 "	very fine	4	4	0
"	" 2 to 3 "	. . .	1	1	0
Double Striped	5 to 6 "	. fine	2	10	0
Anemoneflora Alba	4 to 5 "	. . .	2	10	0
Speciosa	" 4 to 5 "	. . .	2	2	0
Woodii	" 4 "	. fine	2	10	0
Warratah	" 4 to 5 "	. fine	2	2	0
Bealii	" 4 to 5 "	. . .	2	10	0
Corralina	" 3 "	. . .	1	5	0
Lowsonii	" 2 "	. new	1	10	0
Colvillii	" 2 "	. . .	0	10	6

Insignis	" 6 to 7 "	very fine	2	10	0
Eclipse (Press's)	6 to 7 "	. . .	3	3	0

The Prices affixed are for the separate plants, of which not less than 3 can be taken together. If the whole are taken in one lot a considerable reduction will be made. Mr. Lawson will be happy to show them, or give any further particulars that may be required.—Tiverton, Oct. 4th, 1844.

J. KERNAN begs to announce the arrival of his large and carefully selected Dutch, Cape, and other Bulbs of every description.

Finest named Hyacinths, old favourites, from 6s. to 12s. and 18s. per dozen.

Double red mixtures, different shades, 3s. 6d. per dozen.

Double blue, 3s. 6d. per dozen.

Double white, 3s. 6d. dozen.

Single, each colour, as above, 3s. 6d. per dozen.

Early Tulips, Narcissus, Jonquils, Anemones, Ranunculus, Iris, Ixias, Amaryllis, with all the new Lilies and good Herbaceous Plants, hardy and greenhouse, worth cultivating.

J. K. has also to offer, of this season's saving, some very choice seed—

From the finest named Calceolaria, 2s. 6d. per packet.
" " Cineraria, 2s. 6d. "
" " Heartsease, 2s. 6d. "
" " Geranium, 2s. 6d. "
Scarlet Phlox Drummondii, 6d. per packet.
Schizanthus Hookerii, 6d. "
Intermediate Stock, 6d. "

By sowing the above this autumn a season will be saved.

With many other good Biennials and Perennials. Also, Myatt's new Deptford Pine Strawberry; Myatt's British Queen do., Prince Albert do., Lady's Finger do., Keen's Seedling do. Old Pine do., &c., &c.

Bailey's Scarlet Admirable Rhubarb, the very best for early forcing. Giant Asparagus and Sea-kale Plants. Rivers's new Catalogue and Amateur's Rose Guide.

White Clover, Rape, Winter Tares, Rye, and Italian Ryegrass, for early green food. Catalogues may be had on application. All Mr. Rivers's Dwarf and Standard Roses may be ordered through J. K.

Curtis's and other new Budding and Pruning Knives.

4, Great Russell Street, Covent Garden, Oct., 1844.

SPLENDID NEW PLANTS.

JAMES CUTHILL begs most respectfully to announce that he has now ready to send out strong, healthy plants of the following:—Lisianthus Russellianus, 2s. 6d. to 5s. each; L. nigrescens, 5s. to 10s.; L. longifolius, 5s. to 10s.; L. corymbosa, 10s. each; L. glaucifolius seed, at 2s. 6d. per packet. J. C. has a splendid Yellow Lisianthus which will be sent out next year. A Treatise will accompany each order on the best method of growing the Lisianthus. Fine roots of the Prince of Denmark Scarlet Clove-scented Carnation, an excellent forcer, 18s. per doz.; Petunia ornatissima (Van Houtte), a fine pencilled lilac, 1s. each; also Fleming's Trentham Cabul Melon, which gained several prizes at Regent-street—the best-flavoured and most extraordinary bearer; three lights produced 80 lbs. each crop—4th the second; and is now bearing the third; 2s. 6d. per packet. Lance's Victory of England Cucumber, 2s. 6d. per packet. Cuthill's early improved Black Spine, very handsome, 1s. 6d. per packet, or the three for 6s. **The trade supplied by the ounce of the above Cucumbers, by sending a money order on the Camberwell Post-office.—Letters directed to J. Cuthill, Florist, Denmark-hill, Camberwell, London, will be immediately attended to.**

N.B. **The Lisianthus nigrescens can be seen in bloom 7 feet high, with upwards of 1000 blooms upon it, and will continue in flower till Christmas.**

Strong Plants of the British Queen, and Keen's Seedling STRAWBERRIES in pots for next year's forcing can be selected out of 500 pots.

MESSRS. TYSO AND SON, Wallingford, Berks, respectfully invite the attention of the Nobility, Gentry, and Public to their extensive collection of TULIPS, RANUNCULUSES, CARNATIONS, PICOTEES, PINKS, &c.

TULIPS.—In beds, containing an equal number of Roses, Byblœmens, and Bizarres, under name, arranged for planting.

	£	s.	d.
1st Assortment.—A bed of 30 rows, or 210 bulbs, including many extra fine new sorts . . .	20	0	0
A bed of 40 rows, or 280 bulbs, ditto . . .	25	0	0
2d Assortment.—A bed of 30 rows, including many very fine sorts	12	0	0
A bed of 40 rows, ditto	15	0	0

Messrs. T. and Son beg to inform the cultivators of the Tulip that they intend letting out six roots of their splendid new Bizarre "Polydora," a third row Bizarre, figured in No. 120 of the "Floricultural Cabinet." It was much admired by connoisseurs in and near London this season, when in bloom, and will be found to possess all the requisites of a fine show flower. Price 6l.

RANUNCULUSES.—Messrs. T. and Son having cultivated this beautiful flower with unparalleled success, are enabled to supply strong roots of their seedlings and other fine varieties, adapted for competition. They obtained first prizes at Chiswick, June 15th; at Surrey Gardens, June 18th; and at several provincial Exhibitions this season.

Messrs. T. and Son's General Descriptive Priced Catalogue may be had, Gratis, on prepaid application, inclosing two postage labels.

GEO. LIGHTBODY, Falkirk, respectfully informs the cultivators of the RANUNCULUS, that his CATALOGUE of SEEDLINGS is now ready, and may be had on application. A few Varieties of Superior New Seedlings will be let out this season.

NEW CARNATIONS, PICOTEES, AND PINKS.

MESSRS. N. and B. NORMAN'S CATALOGUE of SHOW VARIETIES can be had on prepaid application—Bull Fields, Woolwich.

SUNBURY NURSERY, MIDDLESEX.

J. T. WILLMER, Sen., begs most respectfully to offer to the Public that beautiful Purple Flake CARNATION "MAYO," which received a Certificate at the last July Show of the Horticultural Society of London. Price 7s. 6d. per pair. Likewise a Carnation with buff ground, pink and maroon stripes; a novel and beautiful flower. 7s. 6d. per pair. The above Flowers are well adapted for bedding, when a sufficient stock is raised. The plants are well rooted and strong, with the rest of J. T. W.'s stock of Carnations, Picotees, Pinks, and Auriculas, Catalogues of which may be had by prepaid application, inclosing a postage stamp.—October 4, 1844.

MR. HOYLE'S NEW SEEDLING GERANIUMS.

WILLIAM MILLER respectfully announces to the Nobility, Gentry, Amateurs, and the Trade, that he has purchased the entire stock of the following superb SEEDLING GERANIUMS raised by G. W. Hoyle, Esq., of Guernsey, viz.:

		£	s.	d.
1844—Titus	each—	3	3	0
Pompey		3	3	0
Champion		2	2	0
These three for six guineas.				
1843—Unique		1	1	0
Queen of England . . .		1	1	0
Claude		1	1	0
Sarah Jane		1	1	0
Amelia		0	10	6
Majestica		0	10	6
Rosalia		0	10	6
Flora		0	10	6
General Pollock		0	10	6
These nine for five guineas.				

The entire set 10 guineas, with a discount of 20 per cent. to the Trade. A remittance must accompany the order from unknown correspondents.

Titus received a seedling prize at Chiswick, June 1844; Pompey, Champion, and Unique were pronounced by Professor Lindley, in the *Gardeners' Chronicle* of June 29, 1844, to be "three flowers of good substance, size, and variety;" and Mr. Glenny, in *Gardeners' Gazette* June 22, 1844, says, speaking of the Geraniums at the Chiswick Fête—"Mr. Hoyle had by far the best lot there; Pompey was the best of them, and Titus next." Blooms of the others were likewise exhibited at the June Fête, Chiswick, 1844, and attracted very extraordinary attention, and were universally admired. On the whole, the above varieties, for substance, roundness of form, and general excellent qualities, are among the best ever offered to floriculturists. Printed Lists, with full descriptions, can be had on application. The plants are now ready to send out.

W. M. has been supplied by Mr. Hoyle with some choice GERANIUM SEED, which he saved from his own beautiful Seedlings, and the newest and best varieties sent out by other growers. Sealed packets of 100 seeds, 12s.; do. of 50 seeds, 7s. Also, Hybridised Seed, saved from his own extensive collection of Pelargoniums; packets of 100 seeds, 10s.; of 50 seeds, 6s.

Providence Nursery, Ramsgate.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

Burbidge and Healy respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, Burbidge and Healy refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. Glendinning, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ s.	s.	s. d.	s. d.	s. d.		
10	1 5	20	7 6	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.							
10	2 2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3 10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5 5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

CONICAL BOILERS.—The Boilers invented by John Rogers, Esq., are made of several sizes, and may be obtained of John Shewen, Ironmonger, Sevenoaks, Kent.

They may be seen in operation at Messrs. Chandler's, Vauxhall; Loddiges', Hackney; Henderson's, Pine-apple place, Edgware-road; Rollisson's, Tooting; Pontey's, Plymouth; The Horticultural Society's Gardens, Chiswick; and in the Gardens of the Royal Botanical Society, Regent's-park.

MR. LAWES' MANURES.—**Mixture for Wheat, 7l. per ton; Super-phosphate of Lime, 7l. per ton. To be had at the Factory, Deptford Creek, near London.**

Super-phosphate of Lime, in a concentrated form, may also be procured at Messrs. Warner's, 28, Cornhill, in 7 lb. packets, price 1s.

HYACINTHS AND GREENHOUSE PLANTS.

HUMPHREYS'S SOLUBLE COMPOUND.—A few grains are effective. Half a bottle dissolved in a quart of water furnishes a superior Liquid Guano at half the usual cost. Sold in bottles, price 1s. 6d. each, by Flanagan and Son, Mansion-house-street; Hurst and McMullen, Leadenhall street; W. Clarke, Bishopsgate-within; Smith, Islington Nursery; Grimsley and Co., Covent-Garden; Batt and Rutley, 412, Strand; William and John Noble, Fleet-street; Thomas Gibbs and Co., Piccadilly; Smith, Covent Garden; Charlwood, Tavistock-row; W. J. Nutting, 46, Cheapside; G. Lawrence, 18, Piccadilly; John Kernan, Great Russell-street, Covent Garden; Lockhart, 156, Cheapside; Shuttleworth, Pantheon; Minier, Adams, and Nash, 63, Strand; Thatcher and Son, Islington; J. Fryer, Clarendon-terrace, Camberwell; Thomas Ansell, Camden Town; Thomas Watkinson, Market-place, Manchester; T. S. King, Rochester; W. E. Rendle, Plymouth; Dicksons and Co., Edinburgh; Pontey, Leeds; Fisher, Holmes, and Co., Sheffield; P. Lawson and Son, Edinburgh; J. Thorne, Shepton Mallet; and other leading Seed-men in town and country. Wholesale Agents, Davy, Mackmurdo and Co., 100, Upper Thames-street, London.

COTTAM AND HALLEN, Engineers, Iron-founders, &c., &c., No. 2, Winsley-street, Oxford-street, London, and at Cornwall Road, Lambeth.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with Cottam's Patent or Rogers's Boilers. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for Agricultural and Horticultural Purposes.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

Sales by Auction.

SIX DAYS' SALE OF VALUABLE NURSERY STOCK.

MESSRS. PROTHEROE & MORRIS will submit to Public Competition, by Auction, at the American Nursery, Leytonstone, Essex (about one mile from the Railway Station, Stratford), on Monday, 21st October, 1844, and five following days, at 11 o'clock, (to close Executors' accounts), the celebrated NURSERY STOCK, consisting of the choicest kinds of Fruit and Forest Trees, fine Evergreens, Ornamental, Deciduous, and American Plants, of every variety, in considerable quantities, and lotted to suit every description of purchasers. The Stock is particularly worthy the attention of Noblemen and Gentlemen laying out their grounds, from its having many rare specimens that are only to be found in first-rate collections (also of the Trade, from its excellence), and comprising several thousands Azaleas, Rhododendrons, Ledums, Andromeda, all in fine condition for potting, being well furnished with bloom buds.

N.B. **The ground is proverbial for safety of removal, the mould adhering to the roots. May be viewed prior to the Sale. Catalogues, One Shilling each, returnable to purchasers, may be had of the principal Seedsmen in London, at the Auction Mart, and of the Auctioneers, Leytonstone, Essex.**

BUNNEY'S FINAL SALE.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietor (in consequence of the Lease having expired), to submit to Public Competition by Auction, on the Premises, Kingsland Nursery, Balls Pond-road, on Monday, Oct. 7, 1844, and following days, at Eleven o'Clock each day without reserve, the whole of the valuable NURSERY STOCK, consisting of FRUIT and FOREST-TREES, a considerable quantity of EVERGREENS, AMERICAN PLANTS, STOOLS, &c. The Stock is particularly worthy the attention of Noblemen and Gentlemen laying out their Grounds; also the Trade, from its excellence, and comprising an excellent collection of Ghent AZALEAS, MAGNOLIAS, RHODODENDRONS, &c. May be viewed prior to Sale. Catalogues may be had on the Premises, of the principal Seedsmen, and of the Auctioneers, Leytonstone.

ISLINGTON NURSERY.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietor to submit to Public Competition, on Monday, 14th October, 1844, and 2 following days, at 11 o'clock, (in consequence of the ground being required for building,) a portion of the valuable NURSERY STOCK, consisting of about five thousand Belgian Azaleas, in 40 fine varieties; several thousands fine Hybrid Rhododendrons, well furnished with bloom buds; Green and Var. Hollies, Chinese and Siberian Arborvitæ, about five thousand Laurels, with a fine assortment of Fruit and Forest Trees, Flowering Shrubs, &c.

May be viewed prior to the Sale. Catalogues may be had on the Premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Franklin (in consequence of his Lease having expired and the ground let for building) to submit to Public Competition, on the Premises, Cottage-place, City Road, on Thursday, October 17th, 1844, at 11 o'clock, the whole of his VALUBLE STOCK, consisting of named Seeding Tulips, Auriculas, Carnations, Picotees, and Pinks, Greenhouse and Herbaceous Plants; a capital Greenhouse, 20 ft. by 11 ft.; and sundry Effects. May be viewed prior to sale. Catalogues may be had on the Premises; of the principal Seedsmen; and of the Auctioneers, Leytonstone.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM MAY begs to announce that he is now prepared to send out his collection of the above splendid and showy plants, of all the various shades of colour, from black, or dark, to white. As his stock is large, he is enabled to supply them upon very moderate terms, viz., 42s. per 100.

N.B.—As this plant is becoming popular as a show flower, W. M. has a few very select varieties, by name and colour, at 30s. per dozen, which he has selected for the purpose of exhibition. Also Seed selected from finest double flowers, in packets at 2s. 6d. and 5s. each, post-free. The above may also be had by order of the principal Seedsmen in London, and of Mr. WATKINSON, Market-place, Manchester. A remittance or reference from unknown correspondents.

Hope Nursery, Bedale, Oct. 4.

J. T. WILLMER, King's Road, Chelsea, by Appointment Florist to Her Majesty, begs to inform his Friends and the Public that his Carnations and Picotees are now ready for sending out, catalogues of which may be had on prepaid application containing a postage stamp.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 5, 1844.

MEETING FOR THE FOLLOWING WEEK.

SATURDAY, Oct. 12 Royal Botanic . . . . 4 P.M.

IF MR. HOARE, in his recent work on the VINE, has startled some of our friends by recommending them to make borders without earth, we can hardly fancy their amazement when they shall have read of his proposing to grow Vines with their roots upwards. One would as soon have thought of advising gardeners to walk with their heads downwards; yet so it is.

If, says our author, you give Vine-roots moisture, they will shoot upwards, and grow as well in that direction as they would downwards. This being assumed, it is proposed to take advantage of their good nature, in order to overcome the difficulties attending the cultivation of the Vine out of doors in these northern latitudes. It is not so much our short summers, or our moist climate, that hinders the ripening of the Grape, as the coldness of our springs, and the impossibility of warming our soil till late in the season. Our feeble sun acts too slowly on our chilly land. But if that land were fully exposed to the solar rays in small masses, it would become heated much sooner; and then, if the Vine-roots could be confined to those masses, the vegetation of the plant would be accelerated sufficiently to insure the full maturity of many kinds of Grapes.

Such being Mr. Hoare's mode of reasoning, though not his language, he proposes the following device, which has certainly the merit of originality. He recommends that hollow brick columns be constructed, to the height of five feet above the level of the soil; that a Vine be planted at their bottom, in the inside (but with its head through the brickwork), in such a way that its roots cannot go downwards; then, by filling up the column with prepared materials, the latter will be forced to travel upwards in search of food, which, from its receiving the sun's rays in all directions, will be always warm. At the same time the Vine branches will easily train spirally over the outside of such columns.

But how are the proposed materials in those columns to be kept moist? If the sun is always shining on them, will not their contents become dry as well as warm? And if dry, on what are the inverted roots to feed? Mr. Hoare provides against the risk of dryness thus—

"When the column is built up within three courses of its intended height, and the materials filled in exactly even with the brickwork, a course of whole bricks must be laid over *the entire surface*, taking care that those which rest on the materials are not to be laid on mortar, but merely jointed with it. This course being finished, the last two are to be formed with whole bricks laid flush with the outside, and with their inner ends slightly sloping towards the centre of the column, which will cause all the rain that falls on them to run towards it, and fall into the sunken hollow space that will be there formed by this circular ring of brickwork. The circular space, which will be about 18 inches in diameter, and 6 inches deep, is intended as a receptacle for all the rain that falls on the surface of the top of the column, which will filter through the single thickness of the bricks, forming the bottom of the hollow space, and thence be distributed by absorption throughout the whole mass of the inclosed materials, thereby supplying that moderate degree of moisture to the roots of the Vine, which contributes so advantageously to its nourishment and support. The column will now be complete. The sunken space at the top of it may, if desired, be filled with mould; and Mignonette, or any other annual flower of suitable growth, may be grown in it, and which, hanging pendently over the edge of the column, will present a very graceful appearance."

By this means all danger of dryness is effectually avoided. Mr. Hoare assures us that

"The simple contrivance of chambering the roots inside, and the provision of the sunken water-table at the top of the column outside, prevent the necessity of the slightest trouble being required in the management of the Vine beyond that of the ordinary routine of pruning and training; while, at the same time, the Vine is placed in such superior conditions with reference to its roots, that fine well-ripened Grapes may always be depended upon."

We hope he does not deceive himself. If the Vine will ripen with certainty under this mode of treatment the invention is one of the first importance, and the contriver will have deserved the grateful thanks of the country: but the proof is yet to come.

Knowing as we do the perseverance with which Mr. Hoare has prosecuted his inquiries into the habits of the Vine, how numerous are his experiments, with what care they have been conducted, and how perfectly trustworthy are his statements, we cannot doubt that he has good grounds for expecting success in this novel operation, and we therefore recommend the attempt to be made. A single season will test the value of column-growing; for if the Vine will grow well, it will probably ripen its fruit under such circumstances. There is no question about the roots going upwards if they are prevented going in the opposite direction; there can be no doubt that the Vine will grow freely enough in such a position. The difficulties in our mind are these:—1. Will the columns really furnish moisture enough? The powers of perspiration by the Vine are very great, and the loss of moisture thus occasioned is more considerable than we should have expected chambered columns capable of making good. 2. Will the Vine escape the attacks of the red spider, in this apparent deficiency of moisture? 3. Will it not be stimulated into growth so early in the spring as to be checked and blighted by our cold north-east winds and late spring frosts? 4. Will not the foliage, when it comes to cover over the brickwork, intercept the warm rays of the sun, and thus counteract the effects anticipated from column-growing? These are questions which theory cannot answer; their solution must be sought in experience, and in experience alone.

EVERY TULIP-GROWER is aware of the importance of getting a good strain of any given variety; for twenty breeders may come into colour, yet not more than one of that number shall be what is termed *a decided good break*.

We are often asked, What is the best method of breaking breeder Tulips? or, in other words, what means can be adopted to induce the flower to assume those variegated tints so highly prized by connoisseurs—*a clean feather or perfect flame?*

The general supposition is, that by frequently changing the soil, situation, &c. this desideratum may be attained. We agree that to a certain extent the bulb may be so far affected, that occasional *breaks* may result from adopting this plan. Still we think it may be accomplished in a much more certain and satisfactory manner.

Bulbs in a breeder or self state throw up stronger and bolder flowers than when *in colour;* the stems often decreasing in height several inches, assuming a sort of constitutional weakness (if we may so term it), when they become variegated. In fact, the broken flower is much less robust than its breeder. If, then, a deficiency of vigour will induce a bulb to put forth a feathered or flamed flower, instead of a plain or self-coloured one, by what means can this end be attained?

We imagine that taxing the resources of the bulb, weakening its energies, and reducing its strength, will have the desired effect; and to support our opinion we will adduce a case or two in point. Many years ago, when we thought less of cause and effect than we do now, we were much struck with a singular occurrence, bearing on these ideas. We planted a large bed of breeder Tulips; during their period of bloom they were much frequented by bees, which issued from the cups of the flowers, covered with farina, as black as sweeps. The impregnation of the flowers was completed; they formed perfect heads of seed, which were allowed to remain on till they were thoroughly ripe. The ensuing season the bulbs were planted as usual, and when the flowers expanded we were surprised to find that the whole collection, amounting to some hundreds, were, with very few exceptions, in a broken or variegated state. As it is usual to break off the capsules in order to strengthen the bulb, may we not infer that if the resources of the bulb are drawn upon to ripen a pod of seed, that it is consequently weakened and predisposed to alter its character, and assume those beautiful and varied markings so much desired by the amateur?

On another occasion a friend of ours planted some seedling breeders, the bulbs being in a very diseased and cankered state; the succeeding year he had a general break, and certainly there were some splendid flowers amongst them.

Another old experimentalist informs us, that many of his breeder Tulips break into colour, by allowing the bulbs to be exposed to all weathers, from the time of taking up to the period of replanting.

Now, as variegation in the leaves of plants may often be traced to weakness or disease, may not the same effect arise from the same cause, in the case of the Tulip? Here we have bulbs weakened by ripening seed, others in an unhealthy state when planted; whilst some were constantly acted on by rain, frost, sun, and wind, and in each instance attended with the same results.

We trust our Floricultural friends will act on these hints; as, from repeated successful experiments, we entertain no doubt of their success.—*W.*

ON THE CULTIVATION OF ASPARAGUS.

HAVING seen in the *Chronicle* lately, many inquiries respecting the culture of Asparagus, I beg to give an account of a mode by which I have always produced a very superior article—so much so, that it has almost invariably obtained the premier prize at Exhibitions.

I have hitherto planted the greater portion of my plants in single rows, about a yard apart. I have lately, however, reverted to my old plan of double rows, with a good alley between, as I find some difficulty in getting soil enough in the single-row system, to blanch and load it from the influence of winds, which do Asparagus much injury.

In my general plan for a systematic rotation of crops, my Celery-beds are selected for the new Asparagus plantation. My rule as to quantity to be planted is merely to keep up the stock, by planting an extent equivalent to what I break up to force. Celery-beds prepared in a special way, form a most eligible situation for the new Asparagus plantation, as the person who takes up the Celery leaves the ground ready for the Asparagus without farther trouble.

I grow some also in pigeon-hole pits for forcing; however, I always break up and force a common bed or two for the earliest—say through December and January, and then force the pigeon-holed pits, as those pits become weakened excessively by very early forcing—a whole series of buds in a progressive state being destroyed or paralysed at the removal of the covering after forcing; whereas, if forced later, those buds may by a slight covering of litter be saved.

With regard to preparation of ground, I will commence with Peas, which always precede Celery in my rotation; I appropriate a considerable plot for these, or in other words, I keep them together as much as possible for the sake of system; and having an even number of rows I make it a rule to sow two at a time, at the distance of from four to five feet, and these when picked and the haulm cleared away furnish space for a bed of Celery of about the same width. The Peas being removed, the ground is marked out for the Celery-bed, after what is termed the Scotch method. The bed is now excavated to the depth of a foot, and the soil thrown right and left and made compact; and now six or eight inches of half-decayed leaves and dung, chiefly the former, and which had been used as linings to pits or frames, is trenched in, at least a foot deep in the excavation. The surface is now covered once more with three inches of the best rotten manure, which when spread is forked in and duly mixed. The bed is now planted, and when taken up for use, the operation, with a little care, levels and leaves the bed right for planting the Asparagus when the period arrives.

There is, in my opinion, many wrong notions about the proper period of planting Asparagus. I invariably plant in May, or, in fact, when the Asparagus is what the market-gardeners term "in feather," that is, about six inches high. I have, by many years' experience, found this the best time; and, perhaps, one of the best proofs of it is, that I seldom or never lose a plant. This year I had my ground ready in the end of April, but the drought being very great, I was determined, if possible, not to plant until rain; the rain did not come until the middle of July, however, and tired of waiting, I had planted my Asparagus a fortnight previous. I watered it every morning, and a finer brood of plants were never seen—not even one missed; therefore, there can be no great danger attending spring planting.

In planting, the beds are set out for two rows each, the rows two feet apart, with an alley of four feet between them. The line being stretched precisely where the Asparagus is to be, a slanting cut is made sloping from the line, about nine inches deep, and the soil thrown out as in forming an edge for Box; the same cut is made on the opposite side of the line, leaving a sharp and angular ridge, across which the plants are set astride; the operator taking half of the roots in the one hand and half in the other, divides them across the ridge, at the distance of ten inches between plant and plant.

Previous to planting, however, some fine highly decomposed old vegetable matter is placed up the line, in contact with the roots, and pressed firm; the roots are slightly tipped, and dipped in a puddle of thick dung-water. My plants are usually two years old, for it is a waste of ground to plant earlier, unless in cases of emergency. I need scarcely add that the young plant must be watered every morning for a week, unless rainy.

The only treatment necessary the first year, at least through the growing season, is to keep them perfectly free from weeds. If any crop is planted between them, it should be a row of Coleworts from a June sowing, which would make their growth chiefly after the Asparagus had done its best.

In November, the ground is dressed with good rotten manure, and in spring the alleys are thrown over the manure, just deep enough to cover it. No cropping can now be carried on between the rows, although a good crop of Cauliflowers may be grown in the alleys. The

next point is the mode of dressing pursued in the autumn of the second year.

I hold it of much more importance to feed the Asparagus at the extremities of the roots in the alleys, than over the crown; good cultivators of it in brick-pits, do not allow the alleys, after forcing, to remain empty all the summer; they are filled with good rotten manures, and any one who has witnessed the emptying of these alleys in autumn, preparatory to forcing, must have been struck with the abundance of strong white roots, of which such alleys are full, and which are annually (it may be) cut off. Such roots can scarcely be produced from the crown; and it occurred to me some years ago, that the alley, above all, should be well attended to with manure. I therefore in November of each year, as soon as the ground is cleared of dead stalks and weeds, cause all the loosest of the soil to be drawn off the beds with a rake; the bed is then well dressed with very rotten manure, and left for the winter. In February the alleys are dressed about from six to nine inches thick, with half-rotten manure and leaves, from partially decayed linings, which is trenched down very deep, and the bed is then soiled, over the manure, to the depth of four inches, with fresh soil from the alleys. This completes the whole course of my mode of culture. Finding the plants much injured by winds, in the growing season, I have deemed it necessary to run lines of pitchcord up my principal rows, to support the stems, and this I find a great assistance.

My mode of cutting is similar to the market gardeners', excepting that after cutting about twice in the spring, I leave one stout shoot to each stool, with the intention of promoting the fibrous action of the root. As for the rest, I cut all that are of any size until about the end of May, when I cease cutting a bed or beds of my prime, which I now suffer to grow for the earliest cut in the following spring, continuing to cut from the rest until about the end of June.

I have only used salt for one season to any extent. I have much the same opinion of the mode of applying it that I have of liquid manure—little and often is my maxim. I quite agree with Mr. Bree, in a late Number of the *Chronicle*, that it would be very injudicious to apply it when the tender bud is arising. My plan has been to apply it at intervals, when the shoots are a yard high, giving a slight sprinkling in showery weather, three or four times in July and August.

I would particularly direct attention to the alley dressings of rather raw materials; and, whatever may be the merits of salt, of which I have a high opinion, Asparagus will always require abundance of manure in order to grow it fine. Salt and other inorganic matters can do little for the mechanical texture of the soil, which is a most essential thing in the cultivation of all plants.—*Robert Errington.*

THE ANTIQUITIES OF GARDENING.

No. II.—Extracts from Sir Thomas Hanmer's Manuscript on Gardening—1660, 1670. *Continued.*

"*Prices of July Flowers* received from George Ricketts, of Hogsden, London, 1667: Crown of Bohemia, Bride of Holland, Duchess of York, King of Assyria, Virgin of Middlesex, House of Commons, Belle Infanta, Tamerlaine, &c; all these are at 18*d.* the root, one with another."

"*Fruite-trees* had from Captaine Leonard Gurle, his nurserv neere White Chappell Church, London, 1667. Two Wynter Bon Chrestiens, 3*s.*; two Wynter Bergamots, whereof one was Bergamot de Burgi, 3*s.* Orleans, Matchless, Damascus, and Prunello Plums, 1*s.* apiece. One White Nutmeg Peach, 4*d.* One Syon Peach, 5*s.* One Violet Muske Peach, 5*s.* Three other Peaches, 5*s.* each. One Elrug or Gurle's Nectoran. 10*s.*"

"*Vines*:—D'Arboys, Red Frontiniac, White ditto, Orleans, 2*s.* to 2*s.* 6*d.* the plant. A mat to lap them up in, 1*s.* 6*d.*; total, 3*l.* 6*s.* 6*d.* Many of these were much galled in the carriage down; but hee promised to abate what I thought good, and to make good what died the first year."

"*Gurle.*—I sent up from Bettisfeild to Gurle, by Smyth the carrier, or Johnson, 3*l.* to pay Gurle all due for the trees I had from him in wynter, 1667, which was paid him and I have his receipt. Hee was to send me this next wynter 1669, one tree of Gurle's Nectoran, and one lusty tree of Lord Mordant's Peach instead of these that died, and nothing more."

"*Among the Vines* received from John Rose, the King's gardener at St. James's Park, were the Lombardy, and another called the right Rhenish Grape by the King, and these two were much commended by him." 16 others plants of Vines are enumerated. "These 18 rooted Vines are to cost 12*d.* the root one with the other. I paid after for them. The *Lombardy Vine*, as Rose the King's gardener calls it, bears a fair red Grape, which the King loves. The Rhenish Vine bears a white longish Grape, very good, but must have a warm wall."

Mention is made of a Morillion Cherry; this was most probably a Morello; for the name occurs in the lists of trees planted against walls, together with a distinguishing property of the Morello. "Against the east aspect wall in the Great Garden is planted one Orleans Plum from Sir Chas. Wolsley, then one Morillion preserving Cherry."

"*Plums.*—Monsieur is the same as that called in England the Orleans Plum, a faire, red, round Plum, comes clean from the stone, ripe betimes in August, a hardy tree and a good bearer." [Monsieur is syn. to the Orleans according to the Horticultural Society's list of fruits.]

"Cœur de Pigeon, a small reddish round Plum, very like to the Queen Mother Plum, if not the same." [They were proved to be the same after the lapse of 160 years, in the garden of the Horticultural Society.]

"*Vines.*—The true Raisin of the Sun bears a great long red Grape. The Rhenish Vine bears a white longish Grape, very good, but must have a very warm wall."

Home Correspondence.

The Horticultural Society.—I am surprised to see that some people are complaining about the value of the prizes given by the Horticultural Society to fruit-growers. I have looked at the schedule lately advertised, and I must say a more unreasonable complaint could not be made. It is quite true that the large gold medal is not offered for fruit, although it is for flowers; nor ought it to be. To say nothing of the difference in the cost of conveyance, which you have yourself alluded to, and which I understand is entirely defrayed for the fruit-growers by the Society, (that is very true, *Ed.*) does any gardener pretend to say that as much skill is required to produce five kinds of fruit, as forty kinds of stove and greenhouse plants? Why, if each sort of fruit requires a separate amount of knowledge of gardening, in order to be successful with it, so does each sort of flower; and therefore a collection of stove and greenhouse plants, containing forty distinct plants, will require eight times as much skill as five sorts of fruit. In this point of view the medal for the latter should be only 2*l.* 10*s.*, when that for forty plants is 20*l.*; and yet the Society gives 10*l.*, and is abused for it. It is very well for Mr. Henderson to think that nothing is like leather, but the public will not agree with him. In my opinion the fruit-growers showed their good sense in not putting in claims for higher rewards, as we learn from you was the case; the Society is as liberal in medals as it is proper to be, and it is very ungracious in those who profit by it to grumble, because it is not prodigal. Is there no such thing as honour to be gained by successful exhibition? and does Mr. Henderson think it is the cash, and the cash alone, that is worth striving for? I hope he has higher and less sordid motives. — *A-Looker-on.*

[There seems no object in continuing this discussion; and therefore we here close it. The Society has made its decision for next season; and if the fruit-growers think they have anything to complain of, they should address themselves to the Vice-Secretary immediately after the Exhibition of next year. They may be quite certain that their suggestions will have full consideration.]—*An Exhibitor* adds, "In answer to Mr. Henderson's letter in the last *Chronicle*, you speak of half-a dozen van-loads of plants being brought to the Society's Exhibition, but you do not inform us that the person who sends them does not live two miles from the gardens, and that they gain as many medals as will bring the value of them at one Exhibition to 40*l.*, which an exhibitor of fruit cannot gain at the three, if he was to win the three first Prizes. Now, with regard to the fruit-growers, many who exhibit have 100 miles to bring their productions, and which they do at their own expense, and which expense often amounts to more than the value of their medals, if they are awarded any. I must beg to inform you that if you do not place the fruit-growers upon an equality with the plant-growers, you will soon lose their support.—[We print this leter *verbatim*, as a sample of the accuracy of persons like "An Exhibitor." It is notorious that the Horticultural Society pays the carriage of all fruit sent for exhibition, and returns it carriage-paid.]

Mode of taking Hives.—The discussion in which several of your correspondents have lately engaged concerning the best mode of destroying wasps' nests has led to a gentleman making inquiry of me, whether spirits of turpentine might not be used with effect in destroying bees when hives are taken. He states his reason for asking the question to have arisen from having remarked in several meetings of late for the encouragement of labourers, that the hives of honey exhibited by them had been much discoloured by their burning the bees. I can have no doubt that spirits of turpentine will kill bees as readily as wasps. If the hive were placed overnight above a small quantity of the spirit, I presume all the bees would be found dead or torpid before morning. The objection which occurs to me is the possibility of the odour of the turpentine flavouring the honey, though I think the effect would speedily disappear, and perhaps not be disagreeable. Entomologists are well aware that a bruised or chopped-up Laurel-leaf, when placed under a wine-glass, emits a sufficient quantity of prussic acid to destroy a wasp or fly in about two minutes. I remember the knowledge of this fact having been once applied to the taking of a hive. A quantity of Laurel-leaves were chopped up and placed in a washing-basin; the hive was then placed upon the basin over-night, and in the morning all the bees were found to have dropped into it, and were dead or stupified. A small quantity of prussic acid would probably be quite as effectual as the turpentine, and would produce no bad flavour. I have no experience as a bee-fancier, but I believe the wholesale slaughtering of this valuable and interesting insect has been shown to be unnecessary by the "Conservative Bee-keeper," and other writers on the subject. I have myself no fancies about not destroying bees for their honey on the score of cruelty. I cannot see how this act is more cruel than killing sheep for their mutton, or crabs for their claws. It is still the appointment of the present order of creation, "that the fear of us and the dread of us shall be upon all that moveth upon the earth, and into our hands they are delivered for meat unto us." If, indeed, it can be shown that bees may be quite as economically deprived of their sweets by not destroying them, as they are by the more usual method, then I had much rather see their lives spared. But if the conservative system be not a strictly economical one to the thrifty cottager, its adoption had much better be restricted to the more acute sensibilities of the bee-fancier. —*J. S. Henslow, Hitcham.*

Potatoes.—The observations on the Potato, signed "R." in last week's Paper, are excellent; and it is to be hoped that some of the many Potato-growers who read the *Chronicle* will recollect them in their practice. In securing heaps of Potatoes for winter and spring use in the field or garden, the custom of putting straw next them is almost universal; but it is not the less wrong on that account. I know by experience of some years how much sweeter the tubers are when only coming in contact with the earth. The straw is wasted, and the Potatoes are injured, yet the practice will continue from unthinking habit, as we see daily and hourly in many other things. "R." says nothing on the greening of seed Potatoes. The drying of those that are watery or unripe, recommended in the latter part of "R.'s" paper, will be new to most readers, but is well worth trying. In the British islands we have so many varieties and subdivisions of soil and climate, that all general rules have to be modified in practice. Thus the conflicting theories of Potato-growers might well puzzle the writer in the *Dublin Farmer's Gazette*, quoted at p. 662 of the *Chronicle* for this year. The facts stated seem to oppose each other; but Nature is always consistent—only man knows her means imperfectly, and must always be a learner. At a meeting of farmers in Scotland, they gave clearly the results of their varied experience, and one fact all the speakers seemed to agree in, which was, that seed Potatoes left in the earth where they grew, always produced a healthy crop. Several correspondents confirm this; and on mentioning it to an industrious neighbour of mine, he said that his father practised the same plan forty years ago, with uniform success. The Potatoes were always fresh and well tasted, and as seed they never failed; here we come to the simplest of all possible plans, for a very little extra earth will secure them from any English frost. Any one may see how certainly, after the most careful digging, many Potatoes show themselves in vigorous growth in the following summer. Regarding this important vegetable much is yet to be known, and much to be done. The immense crops considered possible by that great man, T. A. Knight, have not yet been realised, but there is no reason why they should not. One step towards this is the raising new varieties from seed. The very small produce of most early kinds surely need not be always so. Such difficulties have been overcome in gardening and farming, that this may be overcome also; and premiums ought to be offered by Horticultural Societies for new and valuable seedlings. Seeing some new kinds advertised by Mr. M. Smith, at p. 521, I procured a supply of the two last-mentioned sorts, which are, without exception, the finest early Potatoes I ever saw.—*S. H.*——*Lusor* adds,—In the Leading Article of last week is the following observation:—"It has, however, been found, that although Potatoes were taken up, and immediately stored in the earth in moderate quantities, with the mud so wet as to be dripping through the baskets, yet those Potatoes presented as dry an appearance when uncovered in spring, as others that were stored in a dry condition." This may have been the case, if the quantity was very small; but I would caution any Potato-grower from storing a large, or even a moderate quantity in a wet state. It is true that some of the white-skinned, or earlier sorts, may occasionally be stored in a wet state with impunity; but let no one attempt a trial with the red or later kinds. I write from repeated experience, having more than once had that part of the pit which was put together during a heavy shower, sink down into a deep hollow in the course of a few days, on opening which the whole of the Potatoes stored in that wet state were found rotten. These were Red Potatoes; the white kinds I have often stored in the same condition, and they have been uninjured."

Potato Failure.—If I may be allowed to suggest to the unfortunate who complains under this head (p. 645), I shall tell him, that though the season (too often blamed) may be in fault in some degree, his own treatment of his crop has favoured the failure. Thus, "the land is light, on gravel;" he does not state whether his stable dung was moist and decayed, or decaying, or whether put in, as most persons use it, in a dry undecomposed state. The description of land used being thirsty at all times, would this year be more so; the frequent libations of liquid manure most probably would be insufficient at any one time to reach the roots, while the evaporation from the ammoniacal compost used would yield an increase of nutrition to the stems and leaves. It is a well known fact, that even under common treatment, from an over manuring the stem or top being unusually luxuriant, no crop is expected from the roots which will repay the seed, and what there is, is generally, by forcing, large and bad. As in this season probably 16 weeks elapsed before rain or liquid reached the roots in this light soil on gravel, there would be nothing to induce the tuber-shoots to swell, if the plants had even then enough of nourishment to make them; all this time the tops were receiving unusual support, and making leaves instead of fruit. Frequent waterings in dry season nourish those plants effectually whose fruit is on the surface or above ground, but when tuberous ones are to be benefited by watering in a dry season, the earth should be well saturated with water till it reach the root of the plant to be acted upon, and this all gardeners know must be a large quantity to percolate from six to nine inches the liquid manure may then follow, but to insure this reaching the root too, another copious supply of water must immediately be poured in. To secure a vigorous

growth of the Potato, roots should as necessarily be formed before the leaves, as should the roots of a Hyacinth in glass or pot; for, if the top take the lead, it creates an eldest son in the Potato family, and the younger members are robbed by his drawing too hard upon their supplies, and, as in "R.'s" case, sometimes ruining the hopes of all to satisfy his useless existence and extravagant parade.—*A. W.*

Large Pines.—Will Mr. Mills be kind enough to answer the following questions, viz.—When were the suckers planted that produced the fine fruit recently cut at Gunnersbury Park? What has been the probable quantity of dung used to bring the fruit to maturity, and the probable expense for labour in applying the linings, &c.? and, finally, Is the flavour of the fruit grown in a moist dung pit equal to that grown in a more airy and dry situation? If Mr. Mills will answer these questions, it will oblige *An Admirer of well-grown Pines.*

The Dog-rose.—For the information of your correspondent relative to the Dog-rose (*Rosa canina*), p. 637, I beg to state that the fruit of this plant is invariably known amongst the vulgar in this part of the country by the name of Cankers, and the plant itself as the Canker-rose. I am unable to say from what cause it originally acquired this name, but I imagine that it might have arisen probably from the well-known Moss-like excrescences which so frequently occur on its branches, and are occasioned by insects. Many other plants are subject to attacks of a similar kind, and the diseases resulting therefrom are amongst our peasantry commonly, and I think not inaptly, known by the name of Canker.—*T. Bentall, Halstead, Esser.*

Wasps' Nests.—A gardener with whom I am well acquainted has had complete success this year in destroying wasps' nests, by simply pouring down the hole about half a pint of gas-tar in such a way as to smear it all round. This he does at any hour of the day when he chances to find a nest, as the wasps that are out are sure to attempt an entrance, and thus get besmeared and die, whilst those that happen to be within meet the same fate in their attempt to leave the nest.—*J. H.*

Polmaise Heating.—I imagine that the advocates of the Polmaise system of heating are wrong in ascribing the luxuriance of the Vines entirely to that mode of heating. May not a good border have something to do with it? Besides, it appears to me that very little fire-heat has been employed, as we have no mention of the Grapes being ripe until the 20th of September. I cut good Black Hamburgh Grapes perfectly ripened on the 30th of August last, to which no fire had been applied except for about a fortnight, when the Vines were in flower. I imagine that the Polmaise system consists in a good border, vigorous young Vines, a fine summer, with a little fire-heat, and good management, which I own are excellent means for producing fine late Grapes. But will it ripen good Grapes by the middle of April, which I have done by the use of hot water? If this has not been tried, I think it is premature to say that that system will supersede hot water and flues, at least for early forcing. I am induced to send the above, lest inexperienced Grape-growers should adopt the plan, thinking it suitable for general Grape-forcing.—*M. Henderson.*

Lisianthus Russellianus.—At the last meeting, in September, of the Cornwall Horticultural Society, held at Truro, there were shown two splendid plants of this exquisite flower. Upon the plant which was exhibited as a single specimen, and which obtained the first prize, there were upwards of 700 flowers in full bloom; and upon the plant which formed one of a collection, there were upwards of 500 blooms in perfection. These plants were raised and grown in a pit heated with hot water, and were generally managed as recommended by Mr. Cuthill, the successful grower of these lovely flowers. When the flowers began to expand, the plants were removed from the pit to a greenhouse, and were well watered every day, and occasionally they had doses of guano-water, which evidently strengthened the plants and acted as a stimulant in the expansion of the buds, and which they appeared to like. These plants were the admiration of every person who beheld them. Let those who wish to grow them in perfection obtain them from Mr. Cuthill, and strictly adhere to the mode he prescribes for cultivating them, and they will be well rewarded for their trouble.—*W. D.*

Ice-houses.—My ice-house is nearly full at this time, being a large one. It lost but little in the late singular season. It is the one devised and arranged by "A. E. W.," and described by him in the *Chronicle*, p. 117, 1844. I attribute the success of it to the efficient drainage by faggots.—*Micklewell.*

Rose Catalogues.—Taking some interest in whatever relates to Roses, I was glad to see a hint bestowed in the *Chronicle* upon the Rose-growers, as to the mode of setting forth their catalogues. Inaccuracy of names seems unavoidable, and no doubt Mr. Wood is often quite as much at a loss as his customers. But the purchaser certainly has cause of complaint when he compares catalogues, and finds the same Rose described as large and small, or light and dark. In Mr. Paul's directions for growing Roses in pots, Niphetos, a tea Rose, is represented as snowy white in one page, and as lemon in another. Madame Desprez (China) he calls pale lemon, but Mr. Rivers, pure white. Again, the latter, in his catalogue of last autumn, recommends a selection of the very finest Roses from each class, but I observe in his selection of 20 Noisettes, Lamarque is omitted. Of course such an omission may be an oversight, but it is a strange one; but at all events it must lessen the confidence of the purchaser. I would also add that, in the present day, when good Roses are so numerous, and still on the increase, I deem it quite inexcusable to puff a bad one. I think, too, it would be neither a bad rule nor a harsh one, that when a customer finds he has got a worthless variety, he should be at liberty to demand two good ones for it, as the *amende honorable.*—*Philalethes.*

[We hope Rose-growers will take this hint.]

Fastolff Raspberry.—I procured some plants of this Raspberry from Messrs. Youell in March last, and though planted so late, after nearly a fortnight spent in the package, and after the unparalleled drought which succeeded, during which time they were never watered, they more than answer all Messrs. Youell say of them. The fruit was very superior to any I have seen, in size and beauty, and quite equal in flavour to the Antwerp. At the present moment the fine dark large leaf of the plants gives abundant promise for next year, when they will have a much better chance, I hope. I write this as a common act of justice to Messrs. Youell, having observed several attacks on their Raspberry.—*W. D. F.* [Not in our columns; for we know the variety to be excellent.]

Societies.

HORTICULTURAL SOCIETY.

Oct. 1.—R. W. Barchard, Esq., in the chair. From Mr. Robertson, gr. to Mrs. Lawrence, was a collection of plants containing a most beautiful specimen of Aphelandra cristata, nearly six feet high, producing six large heads of brilliant scarlet flowers. This plant, when grown to the same state of perfection as this specimen, has no equal in the stove at this season, its richly coloured showy blossoms presenting a most imposing appearance. In the same group were also Erica Solandri, Sedum Sieboldii, a useful, hardy, succulent herbaceous plant from Japan, and the new Franciscea hydrangeifolia, a Brazilian species of little beauty, and possessing no fragrance, for which the other species are remarkable; likewise good plants of Oncidium Harrisonianum, and microchilum; a fine specimen of Epidendrum ciliare, Rodriguesia recurva, producing numerous pendent racemes of yellow blossoms; together with a variety of Maxillaria picta, Peristeria Barkeri, and Clerodendrum splendens, the fine species from Sierra Leone with bright-red flowers. A Knightian Medal was awarded for this, the Aphelandra cristata, and others.—Mr. Jack, gr. to R. G. Loraine, Esq., received a Knightian Medal for a new species of Echites named Carassa, having on it one fully expanded bloom of a beautiful pink colour. The flowers are smaller than those of E. splendens, but are of a better colour, and the plant has a neater foliage than that of the last-named species.—From Mr. Stanley, gr. to H. Baring, Esq., was a good specimen of Rodriguesia planifolia, producing racemes of yellow flowers, having much the appearance of those of R. recurva. A Certificate was awarded for it.—F. R. Symons, Esq., sent cut flowers of seedling Verbenas, named Negro Boy, Prince Alfred, and Prince of Orange.—From Messrs. Veitch and Son, of Exeter, were seven plants of Brachycome, raised from Swan River seeds. They were of various shades of colour, from white to deep blue. From the same collection were also flowering bulbs of Pentlandia miniata, and Stenomesson aurantiacum.—Mr. Plant, gr. to J. H. Schroder, Esq., sent a variety of Gesnera zebrina, and a good plant of Zygopetalum crinitum.—From Mr. Fowle, of Brixton, was a seedling Fuchsia named Vuurberg.—Mr. Jackson, of Kingston, contributed Chironia floribunda, a pretty species with bright pink flowers, Corethostylis bracteata, a handsome species of Begonia from the Organ mountains, resembling B. sanguinea but different, having the red-coloured stems and leaf-stalks covered with small transparent scales; a Lycium with small tube-shaped violet blossoms; and a plant of Griffinia hyacinthina, producing a fine truss of ultra-marine blue flowers. A Certificate was awarded for the Begonia, and Chironia floribunda.—Of Fruit there was a considerable quantity.—From Mr. Henderson, gr. to Sir G. Beaumont, Bart., was an Enville Pine-apple, weighing 5 lbs. 2 oz., and measuring 17 inches in circumference and 11 inches in length; the number of pips was 15. It was said to have been grown on Mr. Hamilton's system; the sucker was not allowed to come away until last year's fruit, which only weighed 3 lbs., was ripe.—A Banksian Medal was awarded to Mr. Povey, gr. to the Rev. J. Thorneycroft, for two handsome specimens of Black Jamaica Pine-apples (miscalled Montserrats), the largest of which weighed 5 lbs., and measured 17 inches in circumference and 9 inches in length; the number of pips was 9.—A Certificate was also awarded to Mr. Gold, gr. to Sir W. W. Dixie, Bart., for two Queen Pines weighing 4 lbs. 8 oz., and 4 lbs. 10 oz., and measuring 15 inches in circumference and 10 inches in length; the number of pips was 9; they were fair specimens of good cultivation.—For Grapes a Knightian Medal was awarded to Mr. Davy, gr. to G. Smith, Esq., for very fine bunches of Black Hamburgh, and of what is called Wilmot's New Black Hamburgh, but which is apparently a different sort. The berries of this variety are much more fleshy than those of the other, and they are also much larger, and are remarkable for having the surface covered with small indentations, as if they had been beaten by a hammer; the bunches were beautifully covered with bloom.—R. Thompson, Esq., sent three good clusters of Muscat of Alexandria Grape, the heaviest of which weighed 2 lbs. 7 oz.—From Mr. Standen, gr. to Mrs. Keats, was a box containing black bunches of Black Hamburgh Grapes, grown on the open wall; and Mr. Beck, of Isleworth, also produced from the open wall good samples of the same; the latter were cut from Vines managed according to Mr. Hoare's plan.—From Mr. Fish, gr. to H. H. Oddie, Esq., were specimens of his hardy green-fleshed Melon, weighing 3 lbs. each; they were stated to have been the produce of a fourth crop from the same plants. The linings of the bed (which is described at p. 296, 1844), have never been renewed, the only alteration since its first formation being the addition of any vegetable rubbish from the kitchen garden that would give out heat in decaying. Along with these Mr. Fish sent a Cassauba, green-fleshed variety, weighing 2 lbs. 3 oz.; and samples of French Crab, of last year's growth, in good preservation.—J. M. Wrench, Esq., sent fruit of the double-blossomed Peach.—From Mr. J. B. Lawrence, was a glass globe containing growing plants; it was similar to those globes in which gold-fishes are kept, with a piece of glass laid over the top of it; thus keeping the plants as if in a Ward's case.—From the garden of the Society were specimens of Sedum Sieboldii, Bouvardia splendens, having fine heads of vermilion blossoms melting off into a fine rose-colour, Erica transparens, Babingtonia camphorosmæ, a handsome New Holland plant, Begonia acuminata, the yellow variety of Gloriosa superba, and Oncidium Suttoni, together with cut flowers of Lupinus semperflorens, L. arvensis, and a branch of Cornus mascula covered with fruit, which is of no value to eat, being very austere, but pretty on account of its fine red colour. This hardy shrub is not uncommon in gardens, but seldom fruits now-a-days in this country. Of fruit from the garden there were among Pears Louise Bonne (of Jersey), an excellent variety; Belle et Bonne, a large and handsome sort, and in some seasons very good; Aston Town, a good standard Pear, although small, and well adapted for exposed situations, as it is not apt to be blown down; Thompson's, an excellent sugary variety which, owing to the dry season, has ripened much earlier than usual; Buffams, singular on account of its colour; and the Flemish Beauty, an excellent variety, which requires to be gathered before the fruit parts readily from the tree, otherwise, instead of being sugary and melting, it is dry and perfumed. Among Apples there were Mère de Menage, a good kitchen sort; Brabant Bellefleur; Hollandbury; Pomme Violette, singular on account of its dark violet colour, with bloom like a Plum; and Bedfordshire Foundling: the latter is a strong-growing tree, which does not usually bear until it attains a large size, but by taking it up and replanting, by root-pruning, or by pinching off the ends of the shoots after midsummer, it is found to produce fruit in abundance at an early age.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Sept. 20.—This fine display of fruits and flowers took place at the Society's Garden, Inverleith. The subjects for prizes were on this occasion very numerous.—For Peaches, among five competitors, the Silver Medal was awarded to Mr. J. S. Thomson, gr. to Viscount Strathallan, for Red Magdalen, or Royal George, Montaubon, and Galande; 2, Mr. P. Crocket, gr. to Col. Ferguson, for Royal Charlotte, Bellegarde or Galande, and Twyford.—For Nectarines, among six competitors, the Medal was assigned to Mr. W. Sharpe, gr. to Sir J. S. Richardson, Bart., for the Vermash and Elruge.—For three sorts of Grapes, the Medal was awarded to Mr. J. Gow, gr. to Count de Flahault, for Black Prince, Chasselas Musqué, and Black Gibraltar.—For Muscats of Alexandria there were five competitors. The Medal was awarded to Mr. T. Clement, gr. to C. Kinnear, Esq.; and a second premium to Mr. Crocket.—In Black Hamburghs there were seven competitors. The Silver Medal was assigned to Mr. M. Carmichael, gr. to W. Murray, Esq., of Polmaise; the clusters weighing about 5 lbs. each, and having been produced in a Vinery heated by the circulation of warm air from a stove or hot air-chamber, the air being kept dry or rendered moist by being made to pass through a dry or a wet curtain (see p. 500, 1844). A second premium was voted to Mr. Crocket.—In Frontignans there were five competitors. The first prize was voted to Mr. J. Addison, gr. to the Earl of Wemyss, for the White and the Black Frontignan. The second premium was again awarded to Mr. Crocket.—The Pine-apples produced were excellent. For an Enville, weighing 4 lbs., the Silver Medal was voted to Mr. Gow, Tullyallan. For a large Queen, the Silver Medal was voted to Mr. R. Gardiner, gr. to the Earl of Stair; and a second premium to Mr. Gow.—The show of Apricots was uncommonly good. The Silver Medal was assigned to Mr. Crocket, for Royal, Moorpark, and Hemskirke; and a second premium to Mr. J. Thomson, gr. to W. Keith, Esq., for Moorpark, Brussels, and Roman.—For the best Plums, exclusive of Green Gage, the premium was found due to Mr. R. Vair, gr. to J. Williamson, Esq., for Coe's Golden Drop, La Royale, and Nectarine Plum; and for fine Green Gages, premiums were voted to Mr. Thomson and Mr. Gardiner.—The competition in Melons was extensive, and two premiums were given; the first to Mr. W. Kerr, gr. to R. Brown, Esq., the kind being the Duke of Bedford, a green-fleshed sort of high flavour; and the next to Mr. C. Macintosh, gr. to J. Tod, Esq., also for the Duke of Bedford Melon.—In Pears the competition was rather limited, yet two premiums were awarded; the first for Jargonelles of very large size, to Mr. G. Taylor, gr. to G. Broad, Esq.; and the next to Mr. Addison.—The show of Cucumbers was very fine. For the best brace, of the Long Smooth Green kind, the Bronze Medal was voted to Mr. W. Martin; and a premium was awarded to Mr. H. Aitken, gr. to P. G. Skene, Esq., for a sort called the Irish Free-bearing.—For Dahlias, the small piece of Plate offered by the Society for the 20 finest Dahlia blooms produced by Nurserymen, was assigned to Messrs. J. Dickson and Sons, the kinds being

Standard of Perfection, Prince of Waterloo, Hero of Stonehenge, Prince Albert, Sure Enough, Beauty of the Plain, Mrs. Shelley, Lee's Bloomsbury, Antagonist, President of the West, Rising Triumph, Lady St. Maur, Admiral Stopford, Beauty of Bucks, Burnham Hero, Perpetual Grand, Nonpareil, Sir Robert Sale, Phenomenon, and Beauty of Sussex. Two other nursery collections were found to be of great merit, and nearly equal to each other; and the Committee therefore voted the Society's Silver Medal for each—to Messrs. Carstairs, Kelly, and Co., and to Messrs. T. and W. Handasyde. —For the Prize of three sovereigns offered by the Society for the finest 18 blooms produced by Practical Gardeners, there were no fewer than 11 competitors. The successful candidate was Mr. W. Thom, gr. to Capt. M. Innes, whose flowers were, Standard of Perfection, Mrs. Shelley, Sphere, Prince of Wales, Essex Triumph, Westbury Rival, Antagonist, Hero of Stonehenge, Lady Borland, Lady St. Maur, Blue Bonnet, Burnham Hero, Coronation, Victor, Prince Albert, Sir Robert Sale, Attila, and Sir John Stewart Richardson. Two other collections sent were each rewarded with the Society's Silver Medal. They were from Mr. Thomson, gr. to W. Vere, Esq., and from Mr. Addison.—The Medal offered for the best 12 blooms produced by Amateurs who cultivate their own plants, was gained by Mr. A. Ambrose, with Phenomenon, Mrs. Shelley, Prince of Wales, Essex Triumph, Sir J. S. Richardson, Duchess of Richmond, Indispensable, Bridesmaid, Bedford Surprise, Antagonist, Maria, and Lady St. Maur; and a premium was voted to Mr. J. Sanderson.—A number of Seedling Dahlias, the produce of 1843 or of the present year, were exhibited; but none of them excelled the finer varieties now in cultivation. No premium was awarded. —Two Collections of Carnations, flakes and bizarres, were much admired. The Silver Medal was awarded to Mr. D. Foulis, gr. to J. Tytler, Esq., the flowers being Simpson's Marquis of Granby, Wood's Commander-in-Chief, Lady Ely, Rainsforth's Game Boy, Elliot's Duke of Sutherland, Ely's Duke of Bedford, Mr. Grainger, Ely's Magnificent, Adinbroke's Lydia, Dalton's Lancashire Lass, Tutchet's Don Juan, and Duchess of Devonshire; and the bronze Medal to Mr. Thomson, for the other collection. A premium for Picotees was likewise awarded to Mr. Foulis.—The display of Hollyhocks was rich, and two awards were made—the first to Mr. Foulis, and the next to Mr. Alexander Foulis, gr. to Admiral Sir Philip Durham.—At this meeting an unusual number of articles were brought forward, for which no premiums had been announced in the programme; and several being very meritorious, received marks of distinction. A stand consisting of above 80 seedling Pansies, some of them of great beauty, was considered deserving of the Silver Medal, which was accordingly voted to the raiser, Mr. J. Finlayson, of Kincardine. — Another medal was awarded to Mrs. Erskine, for a collection of nine distinct kinds of Oranges.—An extra premium was voted to Mr. J. Macnaughton, gr. to J. Wauchope, Esq., for collections of several kind of fine fruits.—From Leith Walk Nurseries were exhibited plants of the golden-ribbed Beet (Poirée à cardes jaunes of the French), of a very elegant appearance; and also specimens of the Chou Nantais, a neat crisp little Cabbage, and Maclellan's new winter Cabbage, apparently a very good variety. —Messrs. Handasyde sent a collection of 80 named Dahlias, along with 17 new fancy striped kinds, of a very striking appearance, although not admissible to the florist's stand.—Messrs. Carstairs, Kelly, and Co., contributed a collection of named Hollyhocks, with guard-petals, some of them of great beauty.—Mr. Oliver sent stands of French and African Marigolds, the latter of uncommon size, and 30 very beautiful varieties of China Aster.—Mr. Anderson produced curious seedling Fuchsias, one being a cross between F. Chandlerii and F. decorticata, the first time these have been hybridised.—From Professor Dunbar were beautiful Cape Heaths, particularly E. inflata, reflexa, alba, verticillata, Irbyana, and retorta.—Dr. Neill sent Acropera Loddigesii, with 30 flowering spikes, and Grobya Amherstiæ, with five spikes of flowers.—Messrs. J. Dickson and Sons showed two magnificent flowering specimens of Gesnera zebrina, one of them 8 feet in circumference around the branches. —Other contributors were, Mr. Deans, who sent a Seedling Apple of considerable promise, and also Seedling Dahlias; and Mr. Kinnear, who showed remarkably fine clusters of the White Raisin and Southfield Black Grapes, produced on the back wall of his vinery; Mr. Deuchar contributed very late Gooseberries, and excellent specimens of the Borsdorff Apple; and Mr. Goodall sent Astrachan Apples and Retarded Cherries; Mrs. Brown, large Pears; Mr. Bridges, large Swedish Turnips; and Mr. Anderson, very large White Turnips.

Reviews.

Bird-Architecture. By James Rennie. Vol. XI. of Knight's Weekly Volume.

It is so seldom that the subjects of Mr. Knight's admirable weekly work relate to matters of which we can take notice, that we gladly avail ourselves of the opportunity of mentioning them, which is afforded by the republication of the present volume. If there is one part of the creation more calculated than another to excite admiration, it is the wonderful skill with which birds and insects construct their habitations. The wisdom of the contrivances, their perfect adaptation to the wants and means of the little artificers, and the dexterity with which the wonderful power of instinct teaches these creatures to construct them, are among the most striking evidences of the power and wisdom of the Creator.

"Birds of the same kind," says Ray, "make their nests of the same materials, laid in the same order, and exactly of the same figure, so that by the sight of the nest one may certainly know what bird it belongs to. And this they do though living in distant countries, and though they never saw, nor could see any nest made, that is, though taken out of the nest and brought up by the hand; neither were any of the same kind ever observed to make a different nest either for matter or fashion. This, together with the curious and artificial contexture of such nests, and their fitness and convenience for the reception, hatching, and cherishing the eggs and young of their respective builders (which we have before taken notice of), is a great argument of a superior Author of their and other natures, who hath endued them with these instincts, whereby they are, as it were, acted and driven to bring about ends which themselves aim not at (so far as we can discern) but are directed to; for (as Aristotle observes) οὔτε τέχνῃ, οὔτε ζητήσαντα, οὔτε βουλευσάμενα ποιεῖ ('They act not by art, neither do they inquire, neither do they deliberate about what they do.') And therefore, as Dr. Cudworth saith well, 'They are not masters of that wisdom according to which they act, but only passive to the instincts and impresses thereof upon them.' And, indeed, to affirm that brute animals do all these things by a knowledge of their own, and which themselves are masters of, and that without deliberation and consultation, were to make them to be endued with a most perfect intellect, far transcending that of human reason; whereas it is plain enough that brutes are not above consultation, but below it; and that these instincts of nature in them, are nothing but a kind of fate upon them."

The purpose of Mr. Rennie's book is to explain the details of these things, by the assistance of previous ornithological writers. The work is perhaps the most successful of the publications of its author; it gives in a popular way a great deal of entertaining information, and Mr. Knight has acted judiciously in reproducing it. It seems exactly the kind of publication which will be acceptable to the million, who, we hope, are purchasers of these weekly volumes.

An anecdote concerning the habits of the pensile grosbeak will, we trust, excite those who are interested about birds to make the acquaintance of the rest of the work.

"Another of these gregarious African birds is the pensile grosbeak, which is about the size of a house-sparrow, and makes a basket-nest of straw and reeds, interwoven into the shape of a bag, with the entrance below, while it is fastened above to the twig of some tree, chiefly such as grow on the borders of streams. On one side of this, within, is the true nest. The bird does not build a distinct nest every year, but fastens a new one to the lower end of the old, and as many as five may thus be seen, one hanging from another. From five to six hundred such nests have been observed crowded upon one tree.

"A living author of reputation thus describes these nests; but we must premise that we do not coincide with

his opinion of the structure being devised for defence: 'Several varieties of the finch tribe, in South Africa, suspend their nests from the branches of trees, especially where they happen to impend over a river or precipice. The object of this precaution is obviously to secure their offspring from the assaults of their numerous enemies, particularly the serpent race. To increase the difficulty of access to these 'tree-rocked cradles,' the entrance is always from below, and frequently through a cylindrical passage of twelve or fifteen inches in length, projecting from the spherical nest, exactly like the tube of a chemist's retort. The whole fabric is most ingeniously and elegantly woven of a species of very tough grass; and the wonderful instinct of foresight (or whatever else we may choose to call it) displayed by the little architect in its construction, is calculated to excite the highest admiration. I have often seen twenty or more of these beautiful nests hanging from a single tree.'"*

Garden Memoranda.

Erratum.—In the report of the Horticultural Society's Garden, last week, p. 655, col. *a*, line 52 from top, instead of "Centrosema splendens," read "Camptosema splendens."

Bury Hill, near Dorking.—Your correspondent, "Q.," in his notice of this place, has omitted one of its principal features, namely, the fine plants of Arbutus and Rhododendron that crest the wooded hill behind the house, and which constitute one of its chief beauties. Along the crown of this hill a broad walk is bordered by large plants of most of the best varieties of Rhododendron, and behind, and among these, the new Pines alluded to by your correspondent are dotted about. A collection of hardy Heaths has also been planted in an inclosed spot in front of a covered seat. Besides these inducements to climb the hill, several beautiful views are obtained from its summit. From one point you look down upon the fine sheet of water below the house, and beyond that upon a tract of cultivated country which gradually rises into hills of nearly an amphitheatrical form, thus closing in a very pleasing prospect. By taking down some trees at one end of this elevated walk, a highly picturesque view of the town of Dorking and of Box-hill is opened, the trees which are retained forming, as it were, a frame to the picture. On a knoll in the park, in a line with the walk, a very neat rustic temple has been constructed, and from this spot the prospects are diversified and extensive. The kitchen-garden is a considerable distance from the mansion. Its hothouses once contained perhaps the largest collection of plants of any private garden in Britain, but these were distributed at the death of the former proprietor, and their places are now filled by kinds more in character with the present ornamental style of gardening. In one house there are about 80 varieties of the Camellia, comprising most of the leading sorts, and all in excellent health; and in another house there are some fine plants of the different varieties of Azalea indica. Mr. Scott has raised several beautiful seedlings from lateritia, most of them having flowers in the style of Gledstanesii, but superior, while some are pure white. He also has some of the ledifolia breed, which are a great improvement upon the original white. The Rhododendron is worked here almost with as great facility as the Apple. Seedlings from the common kinds, growing in nursery rows, are budded standard high with improved varieties, and soon form handsome heads. Smaller plants in pots are grafted near the ground at almost all seasons of the year; in the summer months they merely require to be kept close and moist by means of a hand-glass, but in spring and autumn a little artificial heat is necessary. By using these means the splendid hybrids which have been bred from arboreum may in a few years be made as plentiful as ponticum. It may not be generally known that the Chinese Azalea will take by inarching upon the Rhododendron; but whether this union will produce any practical advantage remains to be proved.—*W.*

Miscelianeous.

Ice-houses.—In England these receptacles of frozen water are, generally, under ground, and always, if possible, under the shade of tress, the opinion being, that the main thing, if not the only thing, is to keep away the heat. The heat is to be kept away certainly; but moisture is the great enemy of ice; and how is this to be kept away, either under ground, or under the shade of trees? Abundant experience has proved, that no thickness of wall, that no cement of any kind, will effectually resist moisture. Drops will, at all times, be seen hanging on the under side of an arch of any thickness, and made of any materials, if it have earth over it, and even when it has the floor of a house over it; and wherever the moisture enters the ice will quickly melt. Ice-houses should therefore be, in all their parts, as dry as possible; and they should be so constructed, and the ice so deposited in them, as to insure the running away of the meltings as quickly as possible, whenever such meltings come. Anything in the way of drains or gutters, is too slow in its effect; and therefore there must be something that will not suffer the water, proceeding from any melting, to remain an instant. In the first place, then, the ice-house should stand in a place quite open to the sun and air; for whoever has travelled even but a few miles (having eyes in his head) need not be told how long that part of a road from which the sun and wind are excluded by trees, or hedges, or by anything else, will remain wet, or at least damp, after the rest of the road is even in a state to send up dust. The next thing is to protect the ice against wet, or damp, from beneath. It should, therefore, stand on some spot from which water would run in every direction; and if the natural ground present no such spot, it is no very great job to make it. Then come the materials of which the house is to consist. These, for the reasons before mentioned, must not be bricks, stones, mortar, or earth; for these

* Pringle's Ephemerides, Notes.

are all affected by the atmosphere; they will become damp at certain times, and dampness is the great destroyer of ice. The materials are wood and straw. Wood will not do; for though not liable to become damp, it imbibes heat fast enough; and, besides, it cannot be so put together as to shut out air sufficiently. Straw is wholly free from the quality of becoming damp, except from water actually put upon it; and it can, at the same time, be placed on a roof, and on sides, to such a degree of thickness as to exclude the air in a manner the most perfect. The ice-house ought, therefore, to be made of posts, plates, rafters, laths, and straw. The best form is the circular; and the house, when made, appears as I have endeavoured to describe it in *Fig* 3 of the plate. *Fig* 1, *a*, is the centre of a circle, the diameter of which is ten feet, and at this centre you put up a post to stand fifteen feet above the level of the ground, which post ought to be about nine inches through at the bottom, and not a great deal smaller at the top. Great care must be taken that this post be perfectly perpendicular; for, if it be not, the whole building will be awry. *b b b* are fifteen posts, nine feet high, and six inches through at the bottom, without much tapering towards the top. These posts standabout two feet apart, reckoning from centre of post to centre of post, which leaves between each two a space of 18 inches. *c c c c* are fifty-four posts, five feet high, and five inches through at the bottom, without much tapering towards the top. These posts stand about two feet apart, from centre of post to centre of post, which leaves between each two a space of nineteen inches. The space between these two rows of posts is four feet in width, and, as will be presently seen, is to contain a wall of straw. *e* is a passage through this wall; *d* is the outside door of the passage; *f* is the inside door; and the inner circle, of which *a* is the centre, is the place in which the ice is to be deposited. Well, then, we have now got the posts up; and, before we talk of the roof of the house, or of the bed for the ice, it will be best to speak about the making of the wall. It is to be made of straw, Wheat-straw, or Rye-straw, with no rubbish in it, and made very smooth by the hand as it is put in. You lay it in very closely and very smoothly, so that if the wall were cut across, as at *g g*, in *Fig*. 2 (which *Fig*. 2 represents the whole building cut down through the middle, omitting the centre post), the ends of the straw would present a compact face as they do after a cut of a chaff-cutter. But there requires something to keep the straw from bulging out between the posts. Little stakes as big as your wrist will answer this purpose. Drive them into the ground, and fasten, at top, to the plates, of which I am now to speak. The plates are pieces of wood which go all round both the circles, and are nailed on upon the tops of the posts. Their main business is to receive and sustain the lower ends of the rafters, as at *m m* and *n n*, in *Fig*. 2. But to the plates also the stakes just mentioned must be fastened at top. Thus, then, there will be this space of four feet wide, having on each side of it a row of posts and stakes, not more than about six inches from each other, to hold up, and to keep in its place, this wall of straw. Next come the rafters, as from *s* to *n*, *Fig*. 2. Carpenters best know what is the number and what the size of the rafters; but from *s* to *m* there need be only about half as many as from *m* to *n*. However, carpenters know all about this. It is their every-day work. The roof is forty-five degrees pitch, as the carpenters call it. If it were even sharper, it would be none the worse. There will be about thirty ends of rafters to lodge on the plate, as at *m*; and these cannot all be fastened to the top of the centre post rising up from *a*; but carpenters know how to manage this matter, so as to make all strong and safe. The plate which goes along on the tops of the row of posts, *b b b*, must, of course, be put on in a somewhat sloping form; otherwise there would be a sort of hip formed by the rafters. However, the thatch is to be so deep, that this may not be of much consequence. Before the thatching begins, there are laths to put up on the rafters. Thatchers know all about this, and all that you have to do is, to take care that the thatcher tie the straw on well. The best way, in a case of such deep thatch, is to have a strong man to tie for the thatcher. The roof is now raftered, and it is to receive a thatch of clean, sound, and well-prepared Wheat or Rye-straw, four feet thick, as at *h h* in *Fig*. 2. The house having now got walls and roof, the next thing is to make the bed to receive the ice. This bed is the area of the circle of which *a* is the centre. You begin by laying on the ground round logs, eight inches through, or thereabouts, and placing them across the area, leaving spaces between them of about a foot. Then, crossways on them, poles about four inches through, placed at six inches apart. Then, crossways on them, other poles about two inches through, placed at three inches apart. Then, crossways on them, rods as thick as your finger, placed at an inch apart. Then upon these, small, clean, dry, last winter-cut twigs, to the thickness of about two inches; or, instead of these twigs, good, clean, strong Heath, free from Grass and Moss, and from rubbish of all sorts. This is the bed for the ice to lie on; and, as you see, the top of the bed will be seventeen inches from the ground. The pressure of the ice may, perhaps, bring it to fourteen, or to thirteen. Upon this bed the ice is put, broken and pummelled, and beaten down together in the usual manner. Having got the bed filled with ice, we have next to shut it safely up. As we have seen, there is a passage (*e*). Two feet wide is enough for this passage, and, being as long as the wall is thick, it is, of course, four feet long. The use of the passage is this: that you may have two doors, so that you may, in hot or damp weather, shut the outer door, while you have the inner door open. This inner door may be of hurdle-work and straw, and covered, on one of the sides, with sheep-skins with the wool on, so as to keep out the external air. The outer door, which must lock, must be of wood made to shut very closely, and, besides, covered with skins like the other. At times of great danger from heat, or from wet, the whole of the passage may be filled with straw. The door (*p*, *Fig*. 3) should face the north, or between north and east. As to the size of the ice-house, that must, of course, depend upon the quantity of ice that you may choose to have. A house on the above scale, is from *w* to *x* (*Fig*. 2) twenty-nine feet; from *y* to *z* (*Fig*. 2) nineteen feet. The area of the circle, of which *a* is the centre, is ten feet in diameter, and as this area contains seventy-five superficial feet, you will, if you put ice on the bed to the height of only five feet (and you may put it on to the height of seven feet from the top of the bed), you will have three hundred and seventy-five cubic feet of ice, and, observe, a cubic foot of ice will, when broken up, fill much more than a Winchester bushel: even Dives himself would hardly call for more than two bushels of ice in a day; for more than two bushels a day it would be, unless it were used in cold as well as in hot weather. As to the expense of such a house, it could, in the country, not be much. None of the posts, except the main or centre-post, need be very straight. The other posts might be easily culled from tree-lops, destined for fire-wood. The straw would make all straight. The plates must of necessity be short pieces of wood; and, as to the stakes, the laths, and the logs, poles, rods, twigs, and Heath, they would not all cost twenty shillings. The straw is the principal article; and, in most places, even that would not cost more than two or three pounds. If it last many years, the price could not be an object; and if but a little while, it would still be nearly as good for litter as it was before it was applied to this purpose. How often the bottom of the straw walls might want renewing I cannot say, but I know that the roof would, with few and small repairs, last well for ten years. I have said that the interior row of posts is to be nine feet high, and the exterior row five feet high. I, in each case, mean, with the plate inclusive. I have only to add, that by way of superabundant precaution against bottom wet, it will be well to make a sort of gutter, to receive the drip from the roof, and to carry it away as soon as it falls. Now, after expressing a hope that I shall have made myself clearly understood by every reader, it is necessary that I remind him, that I do not pretend to pledge myself for the complete success, nor for any success at all, of this mode of making ice-houses. But, at the same time, I express my firm belief, that complete success would attend it; because it not only corresponds with what I have seen of such matters, but I had the details from a gentleman who had ample experience to guide him, and who was a man on whose word and judgment I placed a perfect reliance. He advised me to erect an ice-house; but not caring enough about fresh meat and fish in summer, or, at least, not setting them enough above "prime pork" to induce me to take any trouble to secure the former, I never built an ice-house. Thus, then, I only communicate that in which I believe; there is, however, in all cases, this comfort, that if the thing fail as an ice-house, it will serve all generations to come as a model for a pig-bed.—*Cobbett's Cottage Economy*—[16*th Ed.*]

CALENDAR OF OPERATIONS
For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

Now that fires will be kept up regularly for this house, it may be as well to remark that a higher night temperature than was recommended in the spring is now necessary, in order to ripen off late growths as soon as possible; 65° should therefore be the minimum for fire heat during this month, even although the weather should be dull at times. In spring the temperature in plant houses is regulated in a great measure by the quantity of sunlight we receive—the more sun the harder you may force, and the contrary—but now there is no occasion to be so particular. However, if the ripening process can be finished thoroughly before the end of October, without much strain on the fires, so much the better. When plants are well ripened in time, much less fire will be needed to keep them in proper condition through the winter, and experience has clearly proved that the more thoroughly plants are kept at rest in winter, the better they flower in the following season. This applies to plants in general.

Conservatory.—The standard temperature for our conservatory here in winter is 45°; it never exceeds that by fire-heat, and for six weeks after Christmas it is kept at about 40°, and little or no air is admitted artificially for four months. With this treatment most of the half-stove climbers flourish and bloom as well as could be wished—Stephanotus floribundus, Echites suberecta, Ipomœa Horsfaliæ, Combretum purpureum, and many others, as thus treated. About this time we remove the soil from around their stems, down to the main roots, and replace it with charcoal, broken small: this guards them against damp. The surface of the borders is kept porous by frequent stirring, and no water is given till the leaves begin to droop for want of it, and then as much is given at once as will reach the bottom of the border: in a day or two afterwards a little dry soil is placed over the parts watered, to lessen evaporation. On this principle all plants in a dormant state in winter should be watered whether they are in borders or pots, providing these are well drained. Speaking of conservatory climbers, I must mention an old plant, the Ipomœa bona-nox, which proved a great novelty here this autumn. This plant—the "midnight lily" of travellers—flowers only at night, hence, like the Cereus grandiflorus, great interest is attached to it by the curious. The company here streamed out into the conservatory to see the lily-white Ipomœa, or the flowers are gathered and sent in to be admired. Next week I shall say how it may be treated in other places.

Pits, Greenhouse, &c.—If there is anything in gardening which requires reformation more than another, it is the distribution of plants in their winter quarters. The only rule attended to at present, in nine cases out of ten, is to place the tallest plants at the back of the greenhouse stage or pit, then the next in size, and so on, till the lowest fill up the front row. In this way plants the most dissimilar in their nature, and requiring widely different treatment, as Heaths Pelargoniums, Camellias, Cacti, &c. &c. are indiscriminately mixed together, so that one can hardly conceive how, under the best management, one-half of the plants can be kept from destruction through the winter. Nurserymen could never "make both ends meet" if they managed their stock in this way; with them you hear, as bye words, New Holland-house, Camellia-pit, Heath-house, Pelargonium-house, and I know not how many more houses and pits all devoted to distinct families of plants. In large private establishments also, compartments are allotted to the larger groups of plants, and the miscellaneous stock is divided among the large families, as the nature of each plant will suggest. Now, the shortest and the best advice that can be given to the amateur of small means, is to place every plant he possesses of the same genus together, keeping the tallest in each group at the back, as at present, then to follow with the next family whose treatment comes nearest to the first, and so on to the end of the stage or pit.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.
Out-door Department.

So extensive and varied is the collection of Verbenas which now adorn with their brilliant colours our lawns and flower-gardens, that it is a difficult task even to select those most worthy of cultivation. In colour we have little to wish for except yellows and bright blue, and these we are in a fair way to produce, as I have a sulphur coloured variety from my own raising, and one approaching sulphur has been raised by Mr. Girling, of Stowmarket, either of which, if crossed with the orange-scarlet varieties next season, will probably produce a yellow; and blues must emanate from such varieties as Amethystina, Emma, and others of that character. There is, however, plenty of room for improvement in the form of the flowers, and these, before they are perfect, must be round, flat, and perfectly smooth on the edge, with the petals overlapping, so as to show no indenture, the florets blooming well up to the centre of the truss, and the latter forming, when fully open, half a hemi-sphere. Of the scarlet varieties, atrosanguinea still continues the best for form and size; Boule de Feu is brighter in colour, as likewise are Iguea and Melindres superba; formosa elegans and Kyle's speciosa are two orange-scarlet varieties, and very brilliant, but the latter is very liable to mildew early in the season, and consequently soon becomes shabby. Speciosa is synonymous with Incisa coccinea and Zeuxis. Among whites the Queen must be discarded for Princess Royal and Monarch; and in blue Amethystina, Van Gendti, and Hydeana, are the best; Minstrel Boy is a blush lilac, but is surpassed by seedlings of this year. Stewartii is still the best of the purple class, and Rubra purpurea, reddish purple; Charlwoodii and longiflora are also good. Emma is a very fine variety, of dull purple colour, changing to blue as the flowers fade; and Iveryana is a rosy purple still worthy of cultivation. Renown has dark-red flowers tinged with purple; and Smith's excelsa makes a good corresponding bed: Defiance and Ruby are two varieties inclining to pale red, or ruby colour. Among those of a blush-colour, more or less tinged with rose, may be mentioned Bridesmaid, Taglioni, Teucrioides grandiflora, Fortune-teller, and Wood's Princess Royal. Ingramii, Beauty, and variegata are orange-red varieties; Bishopii is rosy lilac, and Beauty Supreme is a very splendid kind of rosy flesh-colour. The best rose-coloured variety is Teucrioides rosea. Among Mr. Girling's varieties the two greatest novelties are Mulberry and Alba lutescens, the former mulberry-coloured and the latter rich cream-colour. Rose d'Amour is a very splendid rose-coloured variety, and Gladiator puts speciosa and the other orange-scarlet varieties out of cultivation. Alba magna is a very large white, and blanda is a rosy blush-colour. Messenger is a bright lilac, Lovely Rambler has slightly paler flowers, and the Giant has very large trusses of bluish-lilac flowers; rubescens is a reddish purple. The great advantage of these flowers is their large size, vigorous habit, and improved form.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Tulips.—It has often been mentioned to us as a matter of regret, that in the numerous lists given in various publications of the best six or twelve Tulips, that no specific mention is made whether they are feathered or flamed. In answer to this we may urge the uncertainty of the flower, as many varieties which feather beautifully one season will come finely flamed the next. But to afford some guide to young growers or amateurs commencing the cultivation of these favourite flowers, and as it is time all bulbs were now obtained for planting, we subjoin a list of cheap varieties, and sorts which are tolerably steady to their respective characters:—*Feathered Bizarres*—Royal Sovereign, Surpass Optimus, Magnum Bonum, and Surpass Catalogue; *Flamed Bizarres*—Polyphemus, Captain White, and Leonidas Posthumous; *Feathered Byblomens*—Bienfaite, Lawrence's Friend, and Black Bagot; *Flamed Byblomens*—David, Queen Charlotte, and Roi de Siam; *Feathered Roses*—Triomphe Royale, Lady Crewe, and Count de Virginnes; *Flamed Roses*—Brilliante eclatante, Camuse de Craix, Cerise belle forme, and Princess tres blanc. We next week shall give the names of a few scarcer sorts of fine properties. *Carnations.*—Keep the potted layers in a close frame till they strike again, taking great care that the leaves are not wet, as this would infallibly endanger their health by inducing them to become spotted. *Pinks.*—Continue to plant out for blooming, and refer to the last back Numbers of the *Chronicle* for the routine of flower-garden work which needs doing. *Dahlias.*—Draw up the soil round the stems in a small hillock, to prevent the crowns of the roots being injured by frosts, which we may soon expect.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Those who have not the advantage of tanks for supplying bottom-heat to their Pines, generally refer their winter arrangement as long as the heat in the bed continues sufficient. Whenever it declines to about 80° it is time to set about renewing it, by taking away part of the most decayed, turning the remainder, and adding fresh, to make up for what has been taken away. Everything should be in readiness before the job is commenced, in order that the plants may remain out as short a time as possible. Keep those in fruit by themselves, and if wanted to ripen soon, place them at the warmest end of the pit. In replunging, be careful not to put the pots too deep, or to make the tan too firm about them at first, for fear of injury to the roots, from over-heating: it is better to incur a little after-trouble than to run any risk. I am of opinion that the plants thrive better when the tan is loose on the surface than when closely patted down; and the risk of injury to the

roots is lessened by allowing a portion of the heat to escape among the foliage of the plants, to which it is beneficial.

Vineries.—Adopt the usual means to keep the vineries containing fruit dry and cool. Grapes not yet ripe will be the better for being kept a little warmer during the day, giving air at the same time that the house is warmed by the pipes or flues. This will also assist to ripen the wood, which is a point of the first importance. In cutting the fruit from spurs, follow the good old practice of pruning back at the same time to the most promising eye; or the more modern one of removing all the eyes except that intended for future bearing, and one at the base of the spur, as recommended in Mr. Roberts's Treatise.

Peach houses.—Where the lights have been wholly removed, the inside borders have probably had sufficient rain; and the lights after being repaired and painted, should be put upon the house, to defend the trees and borders from rough weather. ‖

Melons.—If there is still any promising fruit keep them warm and dry, giving air at all favourable opportunities.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Mushrooms.—In the early part of summer I recommended spawning the beds intended for Ridge Cucumbers, vegetable marrow, &c., under the impression that the mulching of the beds, and the shade of the leaves of the plants, would keep the Mushrooms sufficiently cool. The plan answered pretty well, but there is a disadvantage connected with it, from the liability of breaking the leaves and vines of the plants in getting at the Mushrooms, and also from the Mushrooms being rendered thin from the want of sufficient nourishment, on account of such plants as the Vegetable Marrow rooting so near the surface. I would, therefore, recommend for summer produce the forming of small ridges in any cool situation. Two small beds, put up under the shade of large Chesnut-trees, have supplied me plentifully during the summer. All the attention bestowed upon them was protecting them with wattled hurdles, and a slight covering of hay or straw, kept rather moist in dry warm weather, so as to secure a cool and moist atmosphere for the Mushrooms. This is a much better method than attempting to grow them in houses during summer (unless in some underground department), as too often either the Mushrooms are rendered thin and tough from too much heat, or by admitting draughts or currents of air, that close humid atmosphere is destroyed in which the Mushroom so much luxuriates. Every opportunity should now be taken for preparing beds for winter produce, as previously adverted to. In earthing beds, I prefer fresh soil of a stiffish nature, though I have had fine crops from covering with light sandy soil. The chief thing in all cases is to render the soil as firm as possible, and leave the surface quite smooth, which will enable you to brush off all extraneous matter without any difficulty. The advantage of having horse and cow-droppings well prepared for forming beds is, that not only will the beds bear longer, but the surface of them will not be so liable to crack into fissures, as when the beds are composed of any comeatable littery matter, merely sufficient to create enough of heat to insure the working of the spawn. Those who have lately made bricks for future supply will find this a favourable time for spawning them if they are sufficiently dry. After filling the holes made on purpose, with spawn of a good quality, proceed to build them on a slight hotbed of dung in an open manner, so that the heat may percolate freely; cover up the heap with long litter; take care that the heat never much exceeds that of new milk; turn the heap occasionally, removing those bricks thoroughly spawned, and when all are done, take them to a dry place, cover them with a little dry litter, and they will keep good for years. *Carrots.*—No time should now be lost in getting the main crops out of the ground, and drying them partially before storing them past for the season. The best remedy I have found for preventing the Carrots being spoiled and disfigured by worms, is taking them early out of the ground. Routine—see former Calendars.—*R. F.*

VII.—COTTAGERS' GARDENS.

As was stated last week, advantage should be taken of favourable weather like the present for digging up Potatoes, Carrots, Parsnips, Beet-root, &c., where these are ready for lifting, which will be indicated, in the case of Potatoes, by the haulm becoming withered, and the tubers parting readily from the root. These crops, when got up during dry weather, and stored away in a dry state, not only keep much better, but the ground is not injured by the operation of lifting, which is the case when they are taken up in wet weather, especially in stiff clayey soils. In various parts of the country it is customary to put Potatoes in some convenient place, and after covering them with straw, a layer of earth is thrown over them sufficiently thick to keep out frost; but the best method, perhaps, for a cottager, is to store them up in a dry dark shed or cellar, where they will be secure from frost, and where they may be turned over occasionally when they begin to sprout. Carrots, Parsnips, and Beet-root keep well packed in sand or ashes in a dry room or cellar. A friend writes, "I choose a sunny day in October for taking up these roots, which I allow to remain in the open air till the evening, when I house them in some dry shed or stable for three or four days, leaving the green heads attached. Previously to packing them, I cut the tops off within half an inch of the crown, and store up the roots in a dry place with alternate layers of sand. In this way they keep sound and good for many months. Care must, however, be taken to separate the bruised roots from those that are perfect, and the sand in which they are packed cannot be too dry."—*J. M'H.*

State of the Weather near London for the week ending Oct. 3, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

Books.—*S. Taplin.*—If we think the book worth buying we will say so when we have sufficiently examined it. You will understand our silence.

Disease.—*H. S.*—We cannot say what ails your Camellia buds; insects are not to blame that we can see. The spot on your Geranium leaves is the commonest of diseases, and is supposed to arise from damp in some way.

Electricity.—*W. M.*—That this agent exercises a powerful influence on plants is most probable; but such an experiment as that you mention must have either been a trick or been misunderstood.

Glazed Roofs.—*C. Bt.*—We have no personal experience with these contrivances, and cannot say whether they are as warm in winter as glass, but it is said that they are. They afford quite light enough. Your pipes may run horizontally, but one *must* proceed from the top of the boiler, and the other from near the bottom.

Grapes.—*W. R.*—Mouldiness, and consequent decay of the berries, is occasioned by a close damp atmosphere. The best preventive is obviously a free ventilation, giving fire-heat at the same time.‖

Heating.—*P. G.*—You will not have heat enough for Pines in winter. You ought to have two four-inch pipes in front. An open gutter under your bed will be enough. The boiler must be the third size above the smallest. If you can afford it, you will find it very much more convenient to heat the gutters by a separate boiler; and then a No. 2 boiler will do for the pipes, and No. 1, or the smallest that is made, for the gutters.

Horticultural Garden.—*R. P.*—When a young man has been properly recommended for admission, he receives a printed paper, stating what qualifications are expected of him. Men are not required to bring books, but knowledge.

Insects.—*W. C.*—The little parasites from Western Australia belong to the family Diplolepidæ; but we are not able to identify the species. *R.*——*E. H.*—The Caterpillars infesting your Carrot-roots are the larvæ of a Moth named Agrotis exclamationis, and if you will refer to a recent Number of this Journal, you will find their history, and the best means of eradicating them. *R.*——*A. C.*—Your Rose-beetle is Anisoplia horticola; the Pea-beetle is Bruchus granarius: *Vide* the *Gardeners' Chronicle*, vol. iii. p. 188. The Woodlice are Oniscus asellus and Armadillo vulgaris: the characters and figures of them are given in this Journal, vol. iv. p. 356. The plant, I presume, is a Dodder; the insect feeding upon it is the Hypera nigrirostra. *R.*——*A Wiltshire Clergyman.*—It is the larva of a Sphinx called Smarinthus ocellatus, "the Eyed Hawk-moth," figured and described in "Curtis's Brit. Ent.," pl. and fol. 482. *R.*——*Ullswater.*—The grubs injuring your Grass are the offspring of Anisoplia horticola, called the May-bug, which attacked the Roses last May and June. The rooks and starlings will clear them off in the spring, which is the principal check upon their increase. *R.*——*Jasper Stokes.*—We wish we could impress upon our Correspondents the necessity of transmitting perfect specimens; those you sent were so mutilated by the post, that it was impossible to determine the name of the Bee or of the other fly, which belongs to the Genus Helophilus; they are abundant in the autumn, but in no way detrimental to Bee-hives that we are aware of. *R.*——*Z.*—Pouring boiling water down close to the base of the frames will kill the Woodlice; they will congregate under bricks and tiles laid in the frame, and may be thus easily collected, but the best remedy is to put a toad in with the Melon-plants. *R.*——*Rusticus.*—We have long entertained your opinion as to the evils arising from the cropping of land. No doubt that insects become more firmly established where their peculiar food never fails them. It is also, I believe, ascertained that nitrate of soda, ammonia, &c., will cause certain noxious insects to desert land, and such has often been intimated in our Essays; but to what extent it is for the practical cultivator to determine. *R.*—*M. A.*—No doubt the larvæ of the Fern-fly (Anisoplia horticola), are destroying your Grass-turf at this time, and as we are writing an article upon the subject, we hope next week to give you and *Ullswater* all the information we have collected. *R.*——*Guichenet.*—The spiders' eggs are inclosed in a cottony ball in the autumn, and hatch in the spring. *R.*

Late Dahlia Show.—*G. M.*—We will have nothing to do with the person of whose conduct you complain. If your statement is correct, you were ill treated; but you should not have exposed yourself to it. Why do you come in contact with such people?

Mildew.—*A. M. S.*—Your Rose is attacked by the common white mildew. Washing well with lime-water has been recommended, but we can hardly promise you much success. You had better cut off the worst parts and burn them, and then you will not find your plants much the worse next year. The cause of its appearance has no doubt been the very dry weather, which has stunted the growth of the Rose, and enabled this parasite to take possession of it.

Names of Fruits.—*John Smith.*—Those at present ascertained are—1, 12, Rymer; 6, Christie's Pippin; 7, Norfolk Beaufin; 8, Kirke's Lord Nelson; 9, Kentish Codlin; 10, Bedfordshire Foundling; 14, Keswick Codlin; 15, Hollandbury; 16, Nonsuch; 17, Kerry Pippin; 19, Stagg's Nonpareil; 20, Wormsley Pippin; 21, Dutch Mignonne; 23, Spice; 24, Cornish Gilliflower; 26, Poire Figue; 27, 40, Beurré Diel; 28, Figue de Naples; 29, 43, Autumn Bergamot; 31, Black Achan; 32, 48, Beurré d'Aremberg; 33, Beurré Bosc; 34, Flemish Beauty; 35, Worthless; 36, Spanish Bon Chrétien; 37, Bon Chrétien Fondante; 38, Easter Bergamot; 39, Winter Nelis; 41, Glout Morceau; 42, Beurré de Capiaumont; 45, Beurré Bosc; 46, 47, Easter Beurré.‖——*R. T. C.*—2, Calebasse; 3, Doyenné Blanc; 5, Passe Colmar; 7, St. Germain; 8, Worthless; 9, Brown Beurré; 1, 2, 8, Alexander; 3, Blenheim Pippin; 4, Dumelow's Seedling; 9, Fearn's Pippin; 10, 12, Minchall Crab; 11, Golden Pippin; 14, Autumn Pearmain; 15, 20, Hollandbury; 16, Easter Pippin or French Crab; 17, London Pippin; 18, Bedfordshire Foundling; 19, Sops of Wine; 22, Golden Reinette; 24, Worthless; 25, Norfolk Beaufin; 28, Boston Russet; 29, Gloria Mundi; 30, Downton; 31, Dutch Mignonne, 32, Gravenstein. The fruit of Gansel's Bergamot grown on the coping of the wall is very handsome.‖——*E. D.*—20, Franklin's Golden Pippin; 30, Gansel's Bergamot; 40, Crassane; 50, Old Colmar. ——*Robert Culbertson.*—Beurré de Capiaumont.‖——*A Constant Reader.*—1, Beurré Rance; 50, 51, 52, Beurré d'Aremberg; 53, Williams's Bon Chrétien; 54, Beurré d'Angleterre; 55, Colmar; 47, Jalousie. Apples—52 appears to be the Golden Reinette; 82, certainly Kerry Pippin.‖——*A Young Beginner.*—1, Dutch Mignonne; 3, Cockle Pippin; 4, Salopian; 5, Kirke's Lord Nelson; 6, Rhode Island Greening; 7, Court of Wick; 8, Golden Reinette; 9, Dutch Mignonne; 16, White Winter Colville; 7, 21, Yorkshire Greening; 19, Wormsley Pippin; 32, Norfolk Beaufin; 33, Blenheim Pippin; 34, Newbold's Duke of York. The others are doubtful in their present state.‖——*S. G.*—1, Flat Nonpareil; 2, Norfolk Beaufin; 4, Gravenstein; 6, 12, Hughe's Golden Pippin; 8, Hawthornden; 10, 16, King of the Pippins; 13, Ord; 14, Alfriston; 15, London Pippin; 18, Wyker Pippin; 21, Blenheim Pippin; 22, Syke House Russet; 23, Old Nonpareil; 24, Court of Wick; 25, Downton; 26, Scarlet Crofton; 28, Easter Pippin or French Crab; 31, Dumelow's Seedling; 32, Cockle Pippin; 34, Maiden's Blush; 36, Cockle Pippin; 37, Minchall Crab; 42, Court-pendu Plat. Pears; 43, decayed; 44, Marie Louise.‖——*John Baker.*—The Pear, known in Herefordshire by the name of the Yellow Pear, appears to be the Summer Bon Chrétien. The long cylindrical, probably cider Apple, is not known.‖

Names of Plants.—*Swansea.*—Catasetum Russellianum.——*F. Meares.*—Nicandra physaloides.—*Quercus, &c.*—Oak-spangles; for the history of which see our vol. for 1843, p. 52.——*D. Judd.*—Some kind of Marvel of Peru.——*Clericus.*—Either a variety of Fuchsia thymifolia, or a cross between it and F. microphylla.——*J. P. S. S.*—Diplotaxis tenuifolia.——*J. and T. Goode.*—Echeveria secunda. The Passionflower is not worth house-room.——*A. B. C.*—1, Loasa lateritia; 2, some Cotyledon, not determinable for want of leaves.——*F. Cracker.*—Mutisia latifolia, and some Desmodium.——*Peter Mackenzie.* — Rhizomorpha medullaris. —— *Would-Know.* — Lucombe Oak.¶——*A Subscriber.*—One is a Rhus; the other perhaps an Aloysia.——*F. W.*—You must excuse us. We cannot waste time in puzzling out the names of fragments of Cryptogamic plants having nothing to do with gardening. It is some Cladonia ——*A Subscriber.*—Some Celsia.

New Holland Cedar.—*Quercus.*—The wood called by this name, which looks like soft mahogany, and is become fashionable in pewing of churches and chapels, is produced by Flindersia australis, or some such plant.

Pears.—*Torey.*—When Pears separate so very readily from the tree, they require to be gathered. The variety, Hacon's Incomparable, will become mature in the course of three months after gathering.‖——*E. S.*—Marie Louise is a good dessert pear to plant as a standard.‖

Pelargoniums.—*Witham Cross.*—We see nothing the matter with your leaves. They are getting a little yellow towards winter, that is all. Give them in winter as low a temperature as you can, so as to be sure that frost does not touch them, say 38°. A little frost will not hurt Rhododendron arboreum, but it is better without it; house it now; pot it in one part loam, one silver sand, and three parts peat, mixed with a little cow-dung. We have not tried Potter's guano for such things.——*A. Riall, &c.*—All the treatment which Pelargoniums for planting out in spring require during winter, is to store them up, four or five plants together, in pots or boxes. They may be put into almost any kind of soil in a rather dry state, and placed under a greenhouse stage or in any other place where they may have a little light, and be kept dry and free from frost.‡

Pines.—*Guichenet.*—A few years since, the French knew nothing of Pine-growing; but now they cultivate the fruit abundantly for the Paris market. Versailles Pine-growing is excellent, and has been formerly described in our columns. Their Cayennes have weighed 12 lbs.

Plantains.—*Bulgan.*—Incessantly annoy them by cutting off their heads, and die they must. But if you are negligent, and give them breathing time, they will spring up again, and laugh at your irregular efforts. Some people put salt on them when wounded, and it is not a bad plan. As to the holes left by cutting them up—why, fill the holes up again. If that little labour alarms you, it is useless to think of opposing such a troublesome, but not formidable enemy.

Potatoes.—*Anon.*—The best mode of storing Potatoes, where quantities are required to be occasionally taken out for use during winter, is to form them into a long ridge, from north to south, covered well with earth, and in proceeding make a few partitions with soil. When the haulm is withered Potatoes may be taken up.‖

Potter's Guano.—*Anon.*—This may be applied to a kitchen garden, at the rate of 3 lbs. or 4 lbs. per rod. If this quantity be diluted in 50 gallons of water, a more extensive diffusion of the manure throughout the soil will be insured.‖

Rock Plants.—*A Lady.*—The following are suitable shrubs for planting on rockwork:—Cotoneaster microphylla and marginata, Arbutus uva ursi, Berberis empetrifolia, Aquifolium and glumacea, Cistus and Helianthemums, Pyracantha, Juniperus nana and prostrata, Cytisus purpureus, Daphne Cneorum, Hardy Heaths, Genista triquetra and sagittalis, Vinca major and minor. Of *Herbaceous* plants procure the following:—Saxifragas, Pentstemons, Statice tatarica, latifolia, Gmelini, and bellidifolia, Aquilegia fragrans, glandulosa and canadensis, Campanula grandis, pulla, and versicolor, Dianthus superbus, and others, Gentiana acaulis and asclepiadea, Phlox procumbens, nivalis, and setacea, Œnothera speciosa, macrocarpa, and Frazeri, Iberis sempervirens, Geranium ibericum and sanguineum, Anemone vitifolia, Alyssum saxatile; Ferns and Sedums, Crocuses, Scillas, Narcissi, and other bulbs, for flowering in the spring.¶

Seedlings.—*C. E. S.*—Double Eschscholtzias are very uncommon. The first raised in this country was obtained in Mrs. Marryatt's garden at Wimbledon. Yours is much superior. We should save the seed, and try to improve the variety.

Strawberries.—*W. H.*—We should not trust such plants for early forcing. It is doubtful whether they will have time to re-organise flower buds, (after you have destroyed what are now showing), before the early months of spring. They may; but it is hardly probable.

Toads.—*C. N. R.*—The advice to keep toads in your garden is good. They are most useful and harmless though much-calumniated creatures. Just place one in your hand and look at its beautiful eyes. Poor things! they have no poison in them, and will not hurt your dog if he shou'd venture to eat them; but we hope he is better taught than that.

Tobacco.—*G. B.*—You cannot legally grow Tobacco for the purpose mentioned. If, however, only a very trifling quantity is grown, and *bonâ fide* used as stated, it is not probable that any notice would be taken of it. *W.*

Vines.—*Rusticus.*—Your inquiry demands a longer answer than we have room for this week.

Vine-Borders.—*Appeto.*—We cannot give you further information on this subject. If you consult Mr. Hoare's book you will find his mode of proceeding fully detailed.

Water-plants.—*A Lady.* — The following are suitable for a pond:—Nymphæa alba, Nuphar lutea and advena, Butomus umbellatus; Menyanthes trifoliata and nymphoides, the double variety of Sagittaria latifolia, Hydrocharis morsus-ranæ, Aponogeton distachyon, and Alisma plantago.¶

Miscellaneous.—*H. H.*—If you dip your woollen cloth in a weak solution of pyrolignite of iron (the brown liquor of Lancashire), or into drying oil, it will last the longer for the application.——*A Subscriber.*—Your suggestion has been sent to Mr. Paxton and Mr. Hutchinson.——*Orchis.*—Treat your Sobralia exactly like the tender Cypripediums.—*J. Tyro.*—We do not think you can keep Brugmansias in the open border during winter, unless you incur considerable expense. Provided the ground is thoroughly well drained, you might perhaps effect it by thatching them very thickly with straw, brought to the form of a cone. Leycesteria formosa propagates freely by cuttings, layers, or seeds. It is seldom advisable to place dung below the roots of trees; as to stones above them, what are they to do of either good or harm, unless the trees are newly planted? when, no doubt, if heavy enough, they keep trees firmly in their place.——*A. B. C.*—Phaius maculatus is a pretty good plant. We have not often seen it in flower. It is perfectly well known that Kalmia latifolia is poisonous. ——*H. T.*—If you watch our Weekly Calendar of Operations you will obtain full information on all such points.‡——*D. S. G.*—Full information respecting the destruction of Woodlice is given at p. 356, 1844.‡——*Philobotanicus.*—Many thanks for the specimens of Xenodochus, which is new to us. No doubt the White Elder will take on the Black; but it would be necessary to graft while the wood is quite soft. An E.N.E. aspect is not the best for fruit-trees; the most likely to succeed will be the Glout Morceau and Marie Louise Pears. Or you might get Peach Apricots on that which is well sheltered.——*J. W. T.*—If your stone is not waterproof you may make it so, by covering it with a thin coating of Portland or even Roman cement. But the porous quality of your stone covers for flues is, perhaps, no great disadvantage, for the water is probably not lost, it is only absorbed by the stone. If, however, it really does run through the stone, and is not merely absorbed, then you must go to cement for assistance.

SEEDLING FLOWERS.

Dahlias.—*W. C. D.*—Your flower is fine in its general form, deep, with the centre well up; the petals also are of good form and substance; but there is an irregularity in the centre of the flower which will prevent its being classed as a first-rate variety.*

Verbenas.—*H. H. H.*—The best varieties in your batch of seedlings are 1 and 3, the former a bright rosy vermilion, the latter a deep lilac, the colours being very decided; but in these the flowers appear to want flatness. The scarlet is good in colour, but small, and not equal to many in cultivation. The remainder want decision of colour.*

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and OBTAINED the PRIZE for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Buildings, Bunhill-row, London.

The Agricultural Gazette.

SATURDAY, OCTOBER 5, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Oct. 10—Agricultural Imp. Soc. of Ireland.

THURSDAY, Oct. 17—Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

Oct. 8—Abergavenny. | Oct. 9—Monmouth.

THE BARLEY CROP OF THE PRESENT YEAR is decidedly a failure in quality throughout the greatest part of the country. In ordinary seasons there is no grain-crop which requires more judicious management. Of all the cereal Grasses its straw is the softest and the most succulent, and its grain the most liable to sprout. Mismanagement of the soil prepared for its growth, or neglect of the season, affects not merely its quantity, but also its marketable value. This is accounted for by the fact that the best samples of Barley are made into malt, and by the necessity which therefore exists that the soil prepared for it should be in such a condition as to allow the seed to germinate immediately, and at one time, so that it may ripen uniformly and together, and that thus, during the process of malting, it may all sprout at one time.

During the past *extraordinary* season, however, many farmers have been unable to secure these advantages; and the consequence is, that in some districts, especially in the north of England, though the other grain-crops have been secured weeks ago, we find large flats of Barley yet uncut. In some fields we have patches in every stage of progression from bloom to ripeness; in others, plants of every age are mingled together—the young shoots of summer overtopping the ears which have attained maturity; and these are unfailing indications of an inferior quality of produce—of a coarse, light, uneven sample.

It is impossible to notice these peculiarities without inquiring into their cause, and attempting to ascertain whether or not it was possible to have prevented them. It may be said that "after-wit is dearly bought," but it is not the less valuable for that: it may even be cheap, if it should induce us on a future occasion to avoid the rock on which we may previously have split. The cause of the late and unevenly ripe crops of Barley, it will at once be said, was the extraordinary droughty weather which we experienced before and after seed-time. For instance, many lands—owing to the crop of Turnips not being fed off until spring—had not the advantage of being ploughed in time to allow the frosts to act upon the soil, and thus the necessary fine tilth could not be obtained; and in waiting for rain to enable the clods to be broken up, the proper season of sowing was lost. Elsewhere, again, the crop of Turnips may have been eaten by sheep in pretty good time, and the land ploughed in February, but in consequence of the sheep having been folded on some portions in wet weather, the whole surface could not be brought to an even tilth—the plots where the Turnips had been consumed in wet weather were full of clods, upon which harrow and roller, without the aid of rain, had no effect, while the rest of it was already fit for the reception of the seed. Under these circumstances the sowing was delayed in expectation of rain, but before patience failed the right season was past. The consequence of this proceeding was an irregular germination of the seed, resulting in an unevenly ripening crop. In other cases, under like circumstances, the period of sowing was delayed still longer—delayed, in fact, until a great portion of the moisture escaped from those parts which were properly pulverised—so that when the seed was sown *no plants* at all appeared on the rough portions for several weeks, while only a *tithe* of the seed on the finest plots germinated in proper course. Where this was the case fresh plants continued to appear week after week even till midsummer, and gradually filled up the ground, the roughest plots being of course latest. In such fields at the present moment, the crop consists of plants of every age and every colour, and must produce a sample made up of various qualities of grain.

Such explanations as these will be generally given of the circumstances to which we call attention, and we do not hesitate in vouching for their truth. Indeed, many cases have come under our own observation, where the loss of a season has arisen from a single patch—say an acre—or a few furrows in one field being full of clods and stubborn in texture: the farmer has waited on account of this patch, till all necessary moisture had evaporated. While thus we acknowledge that the nature of the season was the *primary* and *nominal* cause of these evil effects upon the crop, it must, however, be contended, that as it was by no means impossible to have prevented such effects, this was not the *real* and blameworthy cause. Means exist by which the evil effects of the season might have been counteracted—means which have in many cases been successfully employed, and which may, in future, be still more extensively used. The true cause of the failure is our own imperfect cultivation; and it is a matter of duty to call attention to that in which our ordinary practice has been inadequate to meet the exigencies of the season. It may be premised that many crops of fine Barley have been obtained during the present year, without any particular care or management. For instance, upon deep sandy soils, and in cases where a winter ploughing was given, and the surface rolled and sown early—or when a fine tilth could be had by harrowing and rolling, and sowing immediately after the plough—a proper season was obtained, and vegetation progressed favourably. Upon all strong soils, however, and upon soils which had been trodden in wet weather, or which, owing to the Turnip crop having been taken off in spring, had been thoroughly affected by the drought, the ordinary operations of tillage were ineffectual. In these cases it was that our cultivation was imperfect; extra difficulties were not met by extra means. Instead of waiting for rain to pulverise our soils, proper mechanical means should have been used to accomplish this all-important object. For this purpose, there can be no question the BEVERLEY CLOD-CRUSHER would in all cases have been sufficient. By its aid, indeed, we have seen many hundreds of acres prepared at a time when the implements usually employed were useless; and on all these lands the seed was deposited, and the grain has been secured in proper season.

For this implement we are indebted to the ingenuity of Mr. Crosskill, of Beverley. It consists of 23 serrated wheels or rollers, each 2½ feet in diameter, and placed upon a round axle 6 feet wide. The roller parts or wheels act independently of each other upon the axle, and in turning produce a self-cleaning movement at the same time that they crush the hardest clods, and convert them into a fine mould. Further description is unnecessary, as the implement is already well known, though far from being sufficiently appreciated. The pages of the Journal of the Royal Agricultural Society have borne ample testimony to its many uses and general efficacy in the cultivation of all sorts of soil. Our aim, however, is merely to call attention to its use as a pulveriser, and as a means of enabling us to prepare the most stubborn soils, and to make sure of a seed-time in the driest weather.

By its operation many were enabled last spring to obtain a fine tilth, to preserve the moisture of the seed-bed, and sow their Barley in due course upon soils which otherwise could not have been prepared for the crop till midsummer; we may therefore rely upon it as a most effective means of preventing those disastrous delays to which we have called attention. With an agent like this in our power, a season like the past is not necessarily fatal to the prospects of the crop; with such means at command, it was possible, in a great measure, to have prevented the results which we have now to regret.

Why, indeed, should we wait for a shower?—wait, too, for days or weeks, or, as last year, for months, to effect that which we can, by mechanical means, accomplish in a few hours. To wait for the clods to fall in pieces when we have the means of breaking them at any time ourselves, is calling upon the heavens to assist us without putting our own shoulders to the wheel. We no longer wait for the winds to waft us from shore to shore. When, indeed, they are favourable, we make use of them; but when otherwise, we employ a power which can move in the face of them. And it should be the object of the intelligent farmer also to contrive operations, and to provide means which will enable him to overcome the natural difficulties he may meet with. The fable of the farmer who delayed his harvest for one week, in the expectation that his neighbours would lend him their help; and for another, when his neighbours failed to come, in the hope that his friends and relations would come to his assistance; and who, on these also forgetting him, was at last compelled to do the work himself, has a moral which, enforced as it is by the experience of the present year, will, it is hoped, induce us for the future to depend less upon the "chapter of accidents," and more upon ourselves. The gods help those who help themselves.—*H.*

ON the 11th of April, 1843, a Committee was appointed by the House of Commons, on the motion of the Hon. W. Cowper, "to inquire into the RESULTS OF THE ALLOTMENT SYSTEM, and into the propriety of setting apart a portion of all waste lands which shall be inclosed by Act of Parliament, or of any lands which, under any Inclosure Act, shall have been appropriated to the benefit of the poor, to be let out in small allotments to the labouring poor of the district, and also to inquire into the best mode of effecting the same."

The Committee thus appointed presented a Report to the House, based on the evidence of numerous and competent witnesses. The evidence of Wm. Miles, Esq., M.P., and the Report of the Committee, were published in the "Labourers' Friend Magazine;" and a few extracts from these, in addition to the facts which we have already adduced, will amply sustain our opinion of the benefits which the introduction of the Allotment System is calculated to confer on the labourer.

Mr. Miles says:—"I first of all commenced taking any interest in allotments about the year 1828, when I was resident in Nottinghamshire, on a clayey soil, in the parish of Caunton; there were about eight acres, or eight acres and a half, which had been left for the benefit of the parish; . . . I called the attention of some of the parishioners to it; we called a vestry meeting, and, under the 59th of Geo. III., we offered to let this land in allotments to the poor. We divided it into allotments of about a rood to each individual. I was resident in the county, I think, six years afterwards, and I can state from my own experience that, though the soil was a stiff clay, and certainly the last of all soils that I should have taken for allotment gardens, by the assiduity and labour of those poor people it was brought to bear the very best of vegetables: good crops of Potatoes, and Onions, and other vegetables. And I was informed by those who had the allotments, taking a good deal of interest, and going frequently to the gardens and talking to the people, that it was one of the greatest benefits that ever befel the inhabitants of Caunton that the ground left for parochial purposes was allotted to the poorer inhabitants of the place."

Mr. Miles afterwards states:—About six years after this I went to reside in Gloucestershire, where I am at present resident; I then prevailed upon my father to allow me to give, in three different parishes, allotments to the labouring poor. I invariably chose the very best land I could, and that nearest to their own dwellings. I allotted in that way, in the three parishes, land to about one hundred persons altogether; and I can state that invariably in all those places in which those allotments have been so given, the benefits produced to the poor have been something perfectly extraordinary; you have only to go into one of those gardens, and take the chance of any person who may be working there, however late or early, and you will be exceedingly interested, first of all in his manner of addressing you, and at the same time with the benefits which invariably, he says, have resulted from those allotments of ground to himself and to his family. As I understood it was the wish of the Committee, when last I appeared here, that I should state what was the result of the benefits to the poor man as nearly as I could, I went to the garden of one of the first men I saw; I inquired what benefits had accrued to him as to the sale of vegetables, and, at the same time, as to supplying his family with food from his allotment. He stated to me that he occupied a rood of land; that for that rood he paid 1*l.* a year; that he had sold Onions last year to the value of 24*s.*; Carrots to the value of 8*s.*; and that his wife had sold Gooseberries and Currants to the value of 2*s.* 6*d.*; that he had a wife and five children, and that he had provided them from the allotment with every description of culinary vegetable, with all their Potatoes; and had only purchased for the year one sack of Potatoes for the whole consumption of the family; at the same time I should mention that I never go into those gardens but thanks are given to me for what has been done." The 1*l.* per rood, rent included, tithes and rates.

The first branch of inquiry in which the Committee engaged was, "the effect of the arrangements under which the labouring classes are now enabled to hold and cultivate land on their own account," and the Report states:—"The evidence received upon the first branch of their inquiry has been of uniform tenor, and has led them to conclude that the tenancy of land under the garden allotment system is a powerful means of bettering the condition of those classes who depend for livelihood upon their manual labour, whether in manufacturing or agricultural employment; and it has this peculiar merit, that

its benefits are not obtained at the expense of any other class, nor accompanied by any corresponding disadvantage."

After recommending certain regulations to be observed in carrying out the system—all or some of which we may hereafter comment upon—the Committee proceeds to say—"Under these arrangements the system of garden-allotments has proved an unmixed good. It has increased the produce and enlarged the general stock of labour to be expended on the soil. It has enabled the labouring man to turn his leisure moments to profitable account, in raising wholesome food for his family, a rood of land frequently producing vegetables enough for six months' consumption. It has also supplied sound industrial training for the children, under the parents' eye.

"Many striking instances have been stated to your Committee where the possession of an allotment has been the means of reclaiming the criminal, reforming the dissolute, and of changing the whole moral character and conduct." It appears that the holding of land directly from the landlord raises the position of the working-man in his own estimation, and gives him a feeling of independence and self-respect. It gives him a stake in the country, and places him in the class which has something to lose. It partly supplies that deficiency of innocent amusement and rational recreation which weighs so peculiarly upon the lower classes of this country, and which must be counted among the causes which lead to the prevalence of crime. The field-garden has attractions for the working-man strong enough to relieve the monotony of a life of hired toil, and to dispel the listlessness and discontent which are often its accompaniments. It withdraws him from a dependence for amusement on the society of the alehouse. It gives him something which he may call his own; and as its value depends upon his own exertions, it prompts him to the exercise of self-control, and leads him to look on from the present towards the future. It furnishes him with an interest in life to stimulate his faculties, to occupy his mind, and to inspire him with hope; and it becomes a powerful inducement to abstain from any of those offences which would lead to the forfeiture of this valued possession. Mr. Martin stated, "That of 3000 heads of families holding allotments in Kent, not one was committed for any offence during the years 1841 and 1842; that in the parish of Hadlow there were 35 commitments in 1835. The allotment system was introduced in 1836, and in the following year, 1837, the commitments were reduced to 1." "Since that we have had among the tenants of the Society about 15 of those who were in prison in 1835, and there has been no cause of complaint against them since we have had them. Since the year 1837 there has been but one commitment from among the holders of allotments."

"It does not appear to your Committee that these important benefits are purchased at the expense of any other interest. All the witnesses were unanimous as to the punctuality with which the rents of those allotments which are under proper management are paid, and no more trouble seems to have been involved in collecting these than any other rents; frequently, indeed, there is less. Numerous instances have been mentioned where the produce of the allotment has been effectual in keeping men from applying for parochial relief; and it may be safely assumed that a practice which diminishes the poverty of the labouring class, and promotes their good conduct, cannot but be beneficial to the community at large. It has likewise had a peculiarly good effect upon the relations between the landowner and his cottage tenants; increasing his acquaintance and interest in their circumstances, and exciting in them more thankfulness and respect."

To infuse a healthy prosperity into every branch of our industry, and to widen and deepen the channels of remunerative labour, would be at once the universal and effective remedy for the destitution of the labourer. But if this were accomplished, and the labourer left an uneducated and an untrained man, extravagance and dissipation would be likely to appear where the fruits should be comfort and independence. Every improving influence which a sound religious and intellectual education brings to bear on the character of the labourer, and every improving influence which can be laid in his pathway through life, should be sedulously employed. It has been well proved that the allotment system affords such an influence, and the Report from which we have quoted represents that influence in a strong light. In the prosperity of the labourer the allotment system would have a good moral effect, but in his adversity its services become still more important. When we consider the present condition of the labourer, the comforts which an allotment will bring to his cottage and his hearth, the improvement which it will accomplish in his character as a man, and his value as a workman, in the feelings and dispositions of himself and his family; when we look at the increase which his industry will effect in the value of the land, and in the amount of its produce, to the advantage of the landowner and the community, as well as of himself, and to the security afforded against pauperism or criminality—all which benefits the allotment is proved to confer—we hail the allotment system as a powerful palliative of existing evils, and a prolific source of future good: we hail the system as the labourers' friend in prosperity or depression, and its introduction as a measure fraught with substantial advantage to society at large.—*F.*

ON LIME AS A MANURE.

I know of no manure of more importance to the farmer, when properly applied, than lime; but it is as undeniable a fact that the action of no manure is less understood. Its importance has been so much descanted upon, and the proofs of its usefulness so clearly demonstrated, that it is scarcely to be wondered at that the farmer should consider it as a specific for all the wants of his land. Indeed it is considered by many to act as a universal medicine, to be administered whether the field require it or not. I have known cases where it was to supersede draining, farm-yard manure, and bones; and have seen its use so abused, in the neighbourhood of Winfield, as to cause the cessation of growth. I recollect meeting with a farmer, in the spring of this year, who was applying three cartloads of quicklime to an acre of marsh meadow land, in order to kill the reeds, and found it impossible to persuade him that there could be no cure for his land but thorough drainage. We shall endeavour to show when lime is useful to land, and in which cases it would be hurtful.

We only know of one plant, the Salsola soda, which does not contain lime in combination with organic acids. This fact alone is sufficient to account for its presence in all fertile soils, and for the necessity of supplying such lands with lime as may be deficient in it. Schroeder found 33·75 grains of carbonate of lime in the ashes of 32 oz. of the grain of Oats. In soils lime generally exists as sulphate (gypsum), phosphate (bones), carbonate (chalk), and humate, the latter more especially in peaty soils. To lands where lime is deficient it should be applied in its caustic state, as quicklime, and that for the following reasons:—1. Because it would be too expensive to supply the deficiency in the shape of carbonate of lime, where it has to be brought from any distance, inasmuch as chalk contains 45 per cent. of carbonic acid, an amount nearly equal to half the carriage, without contributing any serviceable matter. 2. If the land be rich in organic matter, as in peaty soils, the express purpose of applying lime in a caustic state is to destroy the vegetable matter—an effect produced by lime in the same manner as it is effected by burning it. 3. It destroys coarse Grasses, as Couch-grass, and when mixed with the scourings of ditches, and sods of worthless Grass, makes an excellent top-dressing for Grass lands. 4. It kills seeds and insects, for which reason it is highly important to mix newly-upturned clay, intended for agricultural purposes, with quicklime, in order to destroy the seeds. 5. If the land produces a sour Grass, lime will neutralise the acids, and render the herbage sweet and palatable. 6. Its capability of solution; and lastly, the great chemical effect it produces on the inorganic ingredients of the soil, in rendering potash soluble, and converting poisonous proto-sulphate of iron (green vitriol) into an innoxious compound. These are the most important reasons. The addition of quicklime proves of most importance on heavy clays, which it renders more porous and friable. Where lime is wanting in the soil the fertility of the soil is increased, and superior crops produced by its application. The time for applying lime is not immaterial. It should never be placed on land immediately after manuring with a compound containing ammonia, as farm-yard manure, guano, and soot, as it would expel the ammonia. Lime and dung should never be heaped together, nor should land be dunged till about two months after it has been limed. If the chief purpose for which lime is applied be to destroy vegetable matter, the land should be dry. The immediate effects will be slow, but a little rain will produce the effect far more quickly than if the soil be very wet. In reclaiming lands this should be well recollected. If, however, it be our object to prepare land before the sowing of a crop, the liming should take place in autumn, because the effects of lime are not instantaneous. Supposing a piece of arable land be overrun with Couch-grass, which we have not been able to eradicate, and taking for granted such land has not been limed, we should treat it thus:—The land should be covered immediately after harvest with a thin layer of quicklime, spread out as evenly as possible; then it should be ploughed in, laying one furrow each way, on the unploughed land, and let it lie till February; then plough the whole in a contrary direction, leaving the land lying in the heaps, as it will then do till after spring sowing, when the lime and the weather will have taken such effect on it as to make what is left of the Couch easily got out by using a large harrow instead of a scuffler, which cuts the Couch into small pieces. This method is mentioned by Hillyard, although he does not propose the use of lime, which I think will materially quicken and complete the process. It is not well to apply large quantities of lime at a time, intended to last for a number of years, but it should be our endeavour to put the land into such a condition as to be able to afford sufficient lime for plants, and to keep up this quantity either by small yearly additions, or by larger additions every four or five years; otherwise considerable loss takes place. Caustic and slaked lime are soluble in water; a large quantity will therefore be removed from the reach of the roots of plants by falling rains. Much of it will again be brought up by the plough, but much will go beyond its reach. If the land is not drained the loss will be greater than otherwise. It is true that lime does not remain long either in its causticity or as slaked lime, but is speedily converted into chalk. But rain-water always contains carbonic acid, which dissolves the carbonate (as bicarbonate), and removes it from the soil. Supposing the land to be quite wanting in lime, a larger quantity than usual may be supplied; in such a case, 30 bushels of quicklime, well mixed with the upper soil, would be ample, but more than this is generally applied without injury. The waste should be annually supplied; the fertility of the soil will thus be more effectually kept up than by the general methods. The quicklime should be broken as much as possible, evenly spread over the land, and intimately mixed with the upper soil.

The effects produced by an overdose of lime are sometimes irreparable. On wet and undrained clays an overdose of quick lime causes a chemical combination of the lime with sand, clay, and water. A species of mortar is formed, and the land hardens, so that neither the roots of plants nor rain water can penetrate it. Dry and sandy soils are rendered too porous. Supposing, however, that such effects do not take place, it is certain that the action of lime on the inorganic ingredients of a soil is to render soluble many salts well adapted for the nutriment of plants. It may, therefore, call forth increased fertility at first, but unless the land be plentifully manured it will be miserably impoverished. It must be recollected that lime is no substitute for any other manure, and that farmyard manure must be used at proper intervals; for because lime is required by plants, it does not follow that they can thrive without ammonia or potash. An overdose of lime may call forth another class of weeds at the expense of those which it destroys. A fertile soil should contain at least one-fourth per cent. of lime; it may, however, contain more.

As at the present day much fraud is practised on manures, it may be in place to state the different adulterations of lime, and the methods of detecting them. It is often mixed with carbonate of lime or imperfectly burnt material; in which cases strong effervescence will ensue, if a piece be thrown into a wine-glass filled with diluted oil of vitriol. It is better to slake the lime first.

Water is often poured on lime, which, if added in large quantities, slakes it; it would then not retain its shape, but fall to powder. The best method of judging of the amount of water and carbonic acid is to weigh a piece of the article, then heat it to redness, allow it to cool, and re-weigh it; the loss indicates the amount of impurities. The farmer should therefore burn his own lime, if it is to be had on the spot.—*Albert J. Bernays, Derby.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Cultivation of Crops.—The crops commonly cultivated in this county are Wheat, Barley, Oats, Beans, Potatoes, Turnips, Peas, and Vetches. Those occasionally or but partially grown are Carrots, Mangold Wurzel, Rape, and Flax.

Wheat is the staple produce of East Lothian, and to the production of it the soil of the greater part of the county is well adapted. It is difficult to ascertain with precision the extent of land usually occupied with Wheat, or the quantity annually produced, but both are so considerable as to render everything connected with the cultivation of this crop of the greatest importance to the farmers.

The varieties of Wheat now most esteemed and chiefly grown are Hunter's, Hopetoun, Gregorian, and Brodie's—the two former adapted to winter, and the two latter to spring sowing. But besides these, other kinds of Wheat are occasionally cultivated, as Red Lammas, Blood Red, Hickling's, Chidam, &c. Hunter's is the most esteemed variety of white Wheat now grown in the south of Scotland; it is a winter Wheat, and may be cultivated on any kind of soil of moderate fertility. The Hunter's and Hopetoun varieties were propagated in this county, the former by the agriculturist whose name it bears, and the latter by Mr. Patrick Shirreff, late tenant-farmer at Mungoswells. Red Wheat is not much grown, and is confined almost exclusively to the more elevated parts of the county.

Wheat is sown after summer fallow, Beans, Potatoes, Peas, Vetches, Turnips, and occasionally also after Grass. Bare fallow is not considered to be in all cases the best preparation for this crop, as the young plants are very liable to be thrown out of the soil by the influence of the winter's frost, in consequence of the minute pulverisation given to it by the fallowing process. When sown after Beans, the quality of the grain is frequently superior to that grown upon naked fallow, and in consequence of the greater solidity of the land affording a rougher surface or clod after harrowing sufficiently to cover the seeds, the plants are not so liable to be disengaged from the soil by alternate frosts and thaws, as in the case of fallow or Potato land. On this account, Beans, when the land has been thoroughly cleaned by the culture given to the crop during the summer months, is accounted an excellent preparation for Wheat. As soon as the Bean crop has been removed from the field, the land is ploughed into ridges, and the Wheat-seed immediately sown; the ploughing, sowing, and harrowing operations being all performed in close succession. Experience has placed the Potato crop amongst the most suitable preparations for Wheat, both as regards the quantity and the quality of the produce. I may observe that the Clovers are seldom found to succeed well after Potatoes or Beans, at least not upon strong clay land. Wheat is now frequently sown after Turnips. The practice of

taking up and storing Swedish and common Turnips as favourable opportunities occur during the winter and early spring months, is becoming general. The leaves, on being cut from the bulb, are scattered over the surface of the land, and ploughed down immediately after the removal of the Turnips. Wheat is sometimes but not often sown upon Clover leys, as the practice is by no means a favourite one with the East Lothian farmers. There are some cases, however, in which it is expedient to grow Wheat instead of Oats after Grass, and in this case the land usually receives a partial fallowing.

Seed Wheat is invariably prepared for sowing by pickling—a process resorted to for the purpose of preventing smut. The liquid most commonly employed for this purpose is stale urine, and the process of steeping or pickling is generally as follows:—Two tubs, one of which may be larger than the other, are required for the operation. The barn floor, cart-shed, or some other suitable place, being well cleaned, the larger tub in which the seed is to be steeped is placed on an elevated stand, and the other vessel containing the urine laid alongside it on the floor. The pickling tub is then nearly filled with the grain, and the urine poured upon it with a stable pail till the tub is full. The seed is well stirred with a shovel, and after being all thoroughly moistened and allowed to remain five or ten minutes, the liquid is withdrawn through an orifice into the other vessel. The Wheat thus pickled is then laid in layers upon the floor, and a quantity of newly slacked lime, sufficient to absorb the moisture, sifted upon it while being spread on the floor. A fresh allowance of Wheat is now put into the steeping tub, and treated in a similar manner until the entire quantity to be then sown has been pickled. The seed with the lime sifted amongst it, is immediately afterwards turned over and intimately mixed; it is then conveyed in sacks to the field to be sown. No more seed is pickled at one time than what can be sown on that or the following day, as the vegetative powers of the Wheat are often materially injured, or totally destroyed, from remaining any length of time unsown. Besides stale urine, which is universally regarded as the most efficacious pickle, a solution of salt, sufficiently strong to buoy up an egg, is sometimes employed. But the principal recommendation of this steep is the facility with which it may be prepared. A solution of blue vitriol is also occasionally used as a pickle for seed Wheat.

The seed is, in the great majority of cases, sown by the hand, but the broadcast-sowing machine is also employed on many farms for the same purpose. Wheat is frequently sown in the manner styled ribbing, already adverted to. When this mode of sowing is adopted, the seed is scattered by the hand in the usual manner; but as nearly the whole of it necessarily falls into the intervals between the small drills, the plants grow up in parallel rows in the same manner as if sown by the drill-machine. The practice of ribbing in Wheat upon summer fallows is highly approved of, as a means of preventing the ejection of the young plants by the influence of the winter frosts; it is, further, almost a certain way of securing a good crop of Clover the following year.

Wheat is sown from the beginning of September to the end of March. The quantity of seed depends of course upon the time of sowing, and the quality and condition of the land. After summer fallow, two bushels per acre are deemed sufficient; and after Beans, Potatoes, or Turnips, three bushels. Old Wheat is sometimes sown in preference to the new, and in this case a less quantity of seed suffices.

The produce has been, in many instances, so high as six quarters per imperial acre, but this quantity is reckoned a great crop; four quarters per acre are frequently obtained in the low district; and many farms average 3½ quarters during a lease. Taking the average of the whole county, however, for the last few years, the produce is estimated at 2¾ quarters per statute acre. The weight of Wheat varies, according to the seasons and other circumstances, from 60 to 66 lbs. per bushel. —*T. Sullivan.*

Home Correspondence.

Manures and Drainage.—Publications on experimental or practical manurings are of much value, but there is for the most part a very material omission in such reports. I refer to the analysis of the soil, which is necessary in every such case, previously to the applications of manure. Trials of various substances are made and multiplied with great care and precision, and the results are watched and recorded with minutest attention, without any, or with only a slight reference to the constituents of the soil. Is there any one science besides Agriculture, the facts of which are thus carelessly determined? Now, let any one of these reports be read, and let the reader try the most successful experiment on his own soil. Will the result be similar? No. And why are the results dissimilar? That is a question seldom put; and the experimentalist either sits down discontented, or goes indefatigably to work with the next best manure, perhaps with equal ill success. One tries nitrate of soda on a soil within reach of sea-breezes which have for ages borne to it enough of soda, and he fails. Another carries nitrate of potash to a soil containing sufficient potash, and he fails. So it is with gypsum, and many other substances. One remark, however, may be made by the way, and that is, that appearances sometimes deceive. Some well-established facts have shown that a great increase may be made to the weight of a crop of hay, or to other crops, by a manure the effects of which do not make any great show on the ground; and on the contrary, instances of great apparent with little actual effect often occur, as when a deeper green in a plant may be produced with little benefit to the produce. Some allowance must be made for variety of seasons, but soils of great fertility and good tilth are much less exposed to injury from too dry or too wet weather than poor soils. It is true we cannot give to a poor sterile soil all the constituents of one that is fertile, without incurring an expense far beyond the profit. This, however, is unnecessary, for we know that a very small quantity of some substances will often insure a great crop, and in such cases all further applications would have been an unnecessary outlay; and so, by parity of reasoning, the extra fertilising materials in a fertile soil are frequently of no apparent use. The great object then is, that in every case of manuring being reported, an analysis of the soil be given. It is not enough to say the land is a sand, or gravel, or clay, or loam, but it is indispensable that the constituents of the soil should be minutely stated; then, and not till then, will Agriculture take its proper rank as a science. [This is, probably, sufficiently correct; but coupling together, 1st, the imperfection of our means of analysis, and the consequent impossibility of ascertaining the actual composition of the soil of a field; and, 2d, the great expense of the operation—an expense the greater in consequence of the great variability of soil even in its mineral component parts—coupling together these two considerations, we question if it be not the more economical plan for farmers, if they require them, to try the various manures each for himself on a limited scale, and then be guided by personal experience in the matter of their more extended use, rather than rest on reports of published experiments, the imperfections of which are here so accurately indicated.]—A question has been lately asked in your Journal—"What is the action of sea-salt on carbonate of lime?" In dry weather, after a high tide, little hollows may be observed on the limestone and chalk strata of rocks on the sea-coast, where the salt water has been evaporated, leaving crystals of common salt. In all these instances the rock appears more decomposed than it would have probably been if only rain-water had fallen and been dried there; but this requires to be verified.—Many able articles have been published on drainage, but nearly all of them relate to arable land. Now, a little observation will show that the draining of Grass land is of equal importance. The difference between good and bad pasture land is not so apparent as it is on land bearing a crop. Meadow land more resembles arable land, as there is a crop of hay to be made; but the bulk may be considerable in certain seasons, while the quality is of inferior value. Grass land is usually wet land made partially dry by surrounding ditches, and some open drains. It is very seldom properly drained so as to remove the stagnant water within reach of the roots of Grasses. Grass land may be classified as follows:—1st. Constantly wet on an impervious subsoil; bearing the sedges and many sub-aquatic plants which thrive in land full of stagnant water, but are of little value, and that only in the middle or latter part of summer. 2dly. Wet, but on a porous substratum, and consequently experiencing a slight circulation of air through it, by the passing away of some portion of the water with which it is charged. This land supports better Grasses, but it is so chilled by evaporation, and there is still so much stagnant water, that such land is comparatively very inferior. 3dly. Originally wet, but thoroughly drained by open or closed drains two or three feet deep. Land in this state is but seldom seen, but it generally produces the best Grasses, which are growing the greatest part of the year, and the sedges and inferior Grasses which formerly grew upon it are gradually disappearing. It is frequently objected to drainage, that there is not sufficient fall or outlet for the water. This objection is often imaginary only, and if the operator begins his work at his lowest point, and drains upward as long as he can see the water run, he will generally find fall enough. There are, however, cases where there is a fall, though it is not apparent. This is well worth attention. A stream of water runs nearly as fast at the bottom of a full channel as at the surface; it runs faster than either in the middle. Suppose an outlet to be into a full watercourse, a drain full of water leading into this full watercourse will still slowly convey the water in the drain, and the drain will receive a supply from the water in the soil which would otherwise stagnate there. Such full drains should be frequently cleared of obstructions under the surface, and the good effect will infallibly appear, even under such unfavourable circumstances. From the usually flat surface of Grass land, closed drains are not frequently made. Open drains are commonly too shallow; they should be deep enough to draw away the water beneath the surface soil, so as to render it warm and dry very soon after being wet. It will not then be injured by a wet season, nor by a dry one.—*T. P.*

Dibbling Wheat.—We live in an age when the productive powers of the land are more fully developed than they have hitherto been. Any improvements that will increase the quantity and quality of the produce, are deserving of consideration; to follow an established system, merely because our progenitors have so done, savours strongly of prejudice; agriculture, like other sciences, should keep pace with the increasing intelligence of the age. The dibbling of Wheat has recently met with encouragement; whether the practice will fully answer the expectations of its promoters, further experience will demonstrate. The following experiment, upon a small scale, has succeeded beyond the expectations of the parties interested; when first tried it was laughed at by some, and considered a Utopian scheme by many; whether its further extension will be deserving of support, is a matter for consideration. A gentleman of Epworth dibbled, the first week in November, 1843, two quarts and half a pint of golden-drop Wheat on 1 rood, 5 perches of land, the holes being 9 inches apart each way, two grains being put in a hole; and 5 quarts 2 pints and a half on 1 rood, 35 perches of land; half of the latter being in rows 12 inches apart, and 4½ inches in the row, two grains in a hole; the other half of the 1 rood, 35 perches the same distances, but three grains in a hole. The land is a light, black sandy soil, about 4½ inches deep; the subsoil a very light sand, and had been the previous year cropped with Potatoes, manured with very indifferent straw-yard manure, and had likewise been alternately cropped with Wheat and Potatoes for some years previously. The land dibbled suffered from the depredations of the birds, which got part of the seed. The following management was pursued after the seed was put into the ground:—Three sacks of soot were sown upon the land in December, yet the Wheat looked very thin and bad during the whole of the winter. About the middle of May 1 cwt. of Ichaboe guano, mixed with 2 cwt. of gypsum, was sown upon the Wheat, which, in consequence of the dryness of the season, did not appear to afford much benefit. It was twice hoed during the spring, and in May began to tiller and assume a luxuriant appearance, and maintained a dark healthy colour throughout; the straw was remarkably strong and of good length; the ears very large, many of them containing upwards of 70 grains, but averaged about 60 grains; there were 3 rows of corn, and some 4 in the ear; the stems varied from 8 to 21 from each root. The corn is a remarkably bold and fine sample, and weighed 14 stones per load of three bushels; the weight of the straw was not ascertained. The produce from the 1 rood, 5 perches of land, was over 12 bushels; and from the 1 rood 35 perches, 21 bushels, making 4 quarters 1 bushel of corn from less than 1 peck of seed on 3 roods of land. The growing crop suffered more from the drought, in consequence of being so thin upon the ground, than the thicker sown crops. The same gentleman sowed 1 rood of Wheat broadcast, 4 pecks per acre; 1 rood, 8 pecks per acre; and dibbled 1 rood, 3 pecks per acre. Having disposed of the land with the growing-crops (which got mixed), the produce could not be known; but that sown with 3 pecks per acre had a decided superiority over the broadcast; if the land had been of a stronger nature, in better condition, and the weather moister, there is no doubt the crop would have been more abundant. The gentleman purposes repeating the experiment, being convinced of the practicability and advantages of the dibbling and thin-sowing system. —*T. B. Pearson, Epworth.*——*S. L. B.* adds—I am anxious that the system of dibbling Wheat should be fairly tried. Be so good as to say at what depth the seed should be sown; whether more than a single grain should be deposited in each hole; and at what distance from each other the holes should be made. The rows should, I understand, be six inches apart. I may here mention that the experiment of sowing some Wheat last January, much thinner than usual, has answered very well: the thin-sown has yielded considerably more. In the spring I had some difficulty in dissuading my steward from ploughing it down as a failure. A small quantity of Oats was dressed in the early stage of its growth with nitrate of soda; the effect is very striking, but I merely mention it to draw your notice to the subject; for though the increased produce of the dressed portion was obvious to every one who saw the field, I am afraid the steward has not kept that parcel by itself, which will prevent me from sending you an accurate return. I will send you soon the result of Campbell's steep applied to Oats. [Thank you: we should be glad to hear soon from others of our readers who may have steeped their grain, on this subject. Dibble Wheat in holes 1½ inches deep, and 6 inches apart every way; 2 seeds in each hole.]

Tanks.—If your correspondent "Joe" can heat the water in his tank, he will stop the leaking by introducing a peck of oatmeal into the tank, when the water is quite hot. I have recently tried the experiment with complete success. The oatmeal renders the water mucilaginous, and in its passage through the cracks it deposits a portion of the glutinous matter held in solution, and by degrees fills up the cracks. In the mountains of Scotland, flaws in the stills used for the manufacture of illicit mountain-dew are effectually closed by means of wetted oatmeal. I am assured that in the same manner defective iron boilers may be made perfectly water-tight. "Joe" has committed a mistake in not using pure cement. If all other measures fail, he may still accomplish his object by lining the bottom with roofing tiles placed close together and covering them with a coat half an inch thick of cement, unmixed with any other material, and applied by a workman who knows how to use it.——*R. G. L* ——Another correspondent says that he has three tanks, and all of them hold perfectly well; the liquid in them being secured by puddle dams of good clay 18 inches wide—the tanks being faced with brick. They are sunk in very open gravel.

Carbonate of Iron.—Is not this salt highly conducive to vegetation? It may frequently be seen in the bottoms of open drains (?) of an orange colour. I suppose it to be produced by a previously existing state of iron in solution, as a protoxide or as a sulphate of iron, both equally pernicious to plants. When exposed to the atmosphere, the iron probably unites with the carbonic acid of the air, and thus it becomes carbonate of iron. It will then be seen that Grasses thrive in it with much luxuriance, and if the contents of the drain be thrown out to its sides, better Grasses soon appear there. The subject deserves inquiry. There is not much encourage-

ment from the mere appearance of the yellow pulpy matter in question; it is commonly believed to be injurious, and so it is, as stopping the proper drainage of land. Ferruginous soils, however, are often very fertile. Arable land containing too much oxide of iron in solution, is improved greatly and immediately by the addition of calcareous substances. The benefit arising from composts of peat and lime may be greater or less in proportion as iron abounds or otherwise in the peat.—*T. P.*

Ononis arvensis.—Your correspondent "H. C.," (p. 660), should ponder well the following trite anecdote:—"An old farmer, on his death-bed, told his sons, who were not very industrious lads, that he had deeply buried his money in a particular field, which was the most barren land on his farm. In consequence of this information, soon after the old man's death the sons began to dig (and they dug deeply too) all over the field, and this they did again and again, for it was long before they quite despaired of finding the money. At length, however, they gave over the search, and sowed the land with Corn; when, from the thorough deep digging and clearing which it had received, the crop which they reaped was indeed a treasure." Now, if "H. C." will imagine that he has buried a bag of dollars just below the roots he complains of, and will take the pains to look for them with the same assiduity which was exhibited by the aforesaid youngsters in their case, no doubt he will be rewarded as they were. If your correspondent were to cut off the plant close to the ground, just before it begins to blossom, scoop out a hole, and fill it with salt or hot lime, it would probably kill the root.—*Agricola.*

Quack Manures.—Some years since, Dr. Paris analysed and published his analysis of a number of quack medicines, then popular. Could not something of the kind be done with regard to quack manures? The most ignorant of your readers must know by this time that a variety of saline solutions exercise a powerful effect on vegetation in different ways, and that various of them will exist in solution together, without, at any rate, detrimental reaction. What a facility this affords to the manure doctor! Perhaps you will say that the increasing knowledge of Agricultural Chemistry will be the silent and certain remedy; but does not the enormous sale of patent medicines in this enlightened age prove that the mind of man is as fond of quackery as it is of novelty? Surely the old practical farmer's affection for and firm confidence in his muck-midden is now his safeguard and not his prejudice. Would that some sure analyst and uncompromising man would imitate Dr. Paris! —*Micklewell.*

Societies.

SOUTH DERBYSHIRE AGRICULTURAL SOCIETY.

At the Annual Meeting of this Society, held at Ashbourn on Saturday week, Mr. Colville, who occupied the chair, said that many of his brother cheese-makers were alarmed at the great importation of American cheese, and on this subject complaints were loud and frequent, many of the farmers anticipating ruin. It was by way of reply to these communications, and with the view also of relieving the minds of farmers in the cheese districts, that he was desirous of communicating some facts of which he had obtained possession. In order to obtain correct information on the subject, he had searched, with great care and labour, through the parliamentary returns for the last 12 years. The returns spread over many volumes, but he had reduced the main facts upon a sheet of paper, so that they might see at once how the case really stood. What he intended to show was this, that although the importation of American cheese was greatly increased, it had driven the Dutch cheese out of the market, and the aggregate importation is less now than it was several years ago. Though the American cheese had come in in shoals, the Dutch cheese, instead of being brought here as formerly, was taken elsewhere (to France he was told). He would now show them how the case stood:—

Year.	Imported from America.	From Holland or Belgium.		From other countries of Europe.	Aggregate of Importation.
	Cwt.	Cwt.	Cwt.	Cwt.	Cwt.
1831	9	133,397	..	1049	134,459

By subtracting they would find that the importation of cheese during the last 10 years had actually decreased by nearly 32,000 cwts., while the population of the United Kingdom had increased by 2,300,000 mouths.

FARMERS' CLUBS.

Castle Douglas.—The following is an abridged report of Professor Johnston's second lecture here, taken from the *Dumfries Courier*:—The different substances of which plants are composed must exist in the soil on which they grow; according to the nature of the plant to be reared, so ought the land to be manured. Thus, while Wheat grain contained only two per cent. of ashes, hay contained 10 per cent. Hence the Wheat required a much larger amount of combustible aliment than hay. It was true that the whole of the combustible matter was not obtained directly from the soil, as a large portion of it was derived from the air; but from five to ten per cent. of the straw of Wheat was obtained from the soil; hence the provision made in some leases that no straw should be carried off the land. Different kinds of hay carry off different quantities of inorganic matter from the soil, and consequently have different effects upon the land. The following table shows the quantity of inorganic matter in 100 lbs. of hay:—

	In Rye Grass Hay.	Red Clover.	White Clover.	Lucerne.
Potash	8.8	19.9	31.0	13.4
Soda	3.9	5.3	5.8	6.2
Lime	7.3	27.8	23.5	48.3
Magnesia	0.9	3.3	3.0	3.5
Alumina	0.3	0.2	1.9	0.3
Oxide of Iron	0.0	0.0	0.6	0.3
Oxide of Manganese	0 0	0.0	0.0	0.0
Silica	27.7	3.6	14.7	3.3
Sulphuric acid	3.5	4.5	3.5	4.0
Phosphoric acid	0.3	6.6	5.0	13.1
Carbonic acid	0.1	3.6	2.1	3.2

The soil must contain all of the above, otherwise it cannot build up the plant which contains them; and just in proportion to the supply of the necessary ingredients, in their proper proportions, will be the luxuriance or stuntedness of the crop. Every plant that grows requires, in accordance with the nature and composition of soil, the proportion of the ingredients in its ashes. If no alteration of crops is made, Nature will become exhausted in some of her resources, and the plant, for want of nourishment, must die. We have facts to prove that Nature will not for ever grow the same plant on the same soil. The Black Forest consisted first of Oak, then of Pine, and now it is again covered with broad-leaved trees; and as with trees so with crops, and as on a large so on a small scale. Different modes of husbandry have been adopted. Instead of Oats being grown 15 or 20 years on the same soil, the rotation of three white crops and six years' Grass was adopted; this also has become antiquated, and now the preferable alternation of white and green crop is adopted. Alternating crops, and adding such manures as have been carried off by preceding crops, is the only profitable mode of cultivation, while Nature will also assist by the going on of certain circumstances, such as the decomposition of minerals, &c. &c. A soil containing just sufficient lime for a luxuriant crop of Rye-grass would be far deficient for either Clover or Lucerne. The soil must contain in abundance what your crop specially requires, and consequently the necessity of selecting the manure to suit the crop wanted; and skilful farmers will put this principle into practice, and also select crops suitable for the purposes to which they are to be applied; thus, if you wish to feed for milk you must select a plant containing an abundant supply of phosphoric acid; and this plant will not grow on land which has been exhausted of this acid, though it contained all other necessary ingredients in abundance. The ground becomes exhausted in many ways. By cropping too long with either one kind or different kinds of grain, and carrying off both grain and straw, it becomes exhausted very speedily. It becomes exhausted of some of its soluble matter by the action of rains, just in proportion to the wetness of the soil. By the application of proper manures the waste may be replaced. Feeding will replace a portion of the waste of solid matter; but a great portion of the soluble is lost, both by being, to a small extent, irrecoverable, and because of the direct waste by carelessness or ignorance. These soluble or saline substances are principally contained in the urine of cattle, and just in proportion as it is lost so is the direct waste. The urine of one single cow is valued in Flanders at 2*l.* per annum. What, then, must be the loss on the whole of the cows in Great Britain? Guano is not a more valuable manure than the urine of cattle, and yet farmers carry off this from their yards by large ditches, as if it were only, what it has too long been considered, a nuisance; while they will give 10*l.* a ton for an article of no greater value. By building suitable tanks the whole of the farm-yard saline matter might be preserved, and 900 lbs. of good solid matter, equal to the best Peruvian guano, would be the annual produce of one cow. Tanks ought to be made capable of containing all the urine voided in four months; they should be divided in the middle, and one end, when filled, should be allowed to ferment. This fermentation would be completed in about six weeks, when it should be carried to the land and applied as we now apply guano and water. In the process of fermentation, the ammonia is apt to escape; but by mixing the urine with three times its bulk of water, this will be prevented to a very considerable extent, as shown in the following table:—

Saline matter and ammonia in the urine voided by a cow in 12 months.

	lbs.		lbs
Recent urine contains—solid matter	900	Yields of ammonia	226
Kept 6 weeks—Mixed with water	850	,, ,,	200
,, ,, Unmixed	550	,, ,,	30

We have frequently been astonished at the results of certain saline substances when scattered over unhealthy plants, by the first shower washed into the soil, and immediately consumed by the plant as its proper and necessary food; and just in proportion to the ease with which it gets the substances upon which it is supported, and of which it is composed, will it vegetate. Suppose any of the substances of which a plant is composed to be already in the ground in sufficient proportion, then any addition cannot do good. Suppose soda to be in sufficient quantity for hay, any addition would be unprofitable for a Rye-grass crop, while it would be of immense benefit to double the quantity for Clover or Lucerne. And again, some soils contain it in sufficient quantity for every variety of crop, consequently any addition would be unprofitable. Hence the reason of so many conflicting opinions respecting the utility of manures. A. B. has a field deficient in the due proportion of gypsum; and by applying it to his crop he finds the most beneficial effects. C. D. hears of these results and applies it to his fields, which have already an abundant quantity of it, but require something else; and the consequence is, it does no good, and he pronounces it worthless as a manure; and his next neighbour, E. F., who would have been benefited by its application, has been dissuaded from applying it. Milk contains so much bony earth that in 75 years a cow pastured on an acre of land will carry off a ton of bones; hence some lands used for dairy purposes in Cheshire had, in the course of years, deteriorated to such a degree that they were not worth more than from 5*s.* to 10*s.* per acre, just because the cows pastured on them had carried away all the bone out of the soil. Bone-dust was at length applied as a top-dressing, and the results were so astonishing that the land increased 700 per cent. in value, and the rector's tithes were increased five-fold. Any or all other manures, had they wanted bone, would have proved ineffectual. The bones added just what had gradually been taken off in the lapse of years, in consequence of the peculiar husbandry of the district.

St. Quivox.—Having fixed the 14th ult. to commence their annual inspection of the farms occupied by the different members, the Club assembled at the residence of their president, and proceeded to examine the home farm of Craigie, where the different experiments with various kinds of manures attracted attention, and afforded information. The great interest taken in the proceedings drew together an unusual number of enterprising farmers. The different farms visited in the course of the day were—Mr. Young's, Dalmilling; Mr. Smith's, Braehead; Mr. Reid's, East Sanquhar; Mr. Hendrie's, Highfield; Mr. Reid's, Clune; Mr. Tennant's, Shields; Mr. Bruce's, Shaw; Mr. G. Hendrie's, Orangefield; Mr. Thomas Reid's, Fairfield Mains; Mr. Gairdner's, Monkton Hill; and Mr. Paterson's, Aikenbrae. The very high state of excellence which these farms displayed in every department, in the rearing and management of stock, in the extent and cleanness of the green crops, the luxuriance of the grain crops, and the richness of the pastures, drew forth the admiration of every one; while the different modes of management and manuring were keenly inquired into, and as freely communicated, tending to diffuse a vast amount of scientific and useful knowledge. Although the party, on leaving home in the morning, might have individually thought their own practice perfect, they must have returned in the evening better farmers, or at least with the determination of endeavouring to become so. On the following day the Club met at Gadgirth, and having inspected Mr. Gairdner's farm of Brocklehill on their way thither, proceeded to inspect the home farm of Gadgirth, which, from the varied experiments with special and other manures, so distinctly arranged, occupied a considerable time. The improvements effected by Mr. Burnett to those who may have seen his lands a few years ago, ere he began his operations, must be striking indeed, showing how, under a judicious and well-regulated system, a comparatively sterile and shallow soil may be converted into a deep and fruitful loam. The Club then proceeded to Mr. Inglis's farm of Stair, where a field of splendid Beans upon very poor soil attracted general attention, proving to what an extent this crop may be benefited by a moderate dressing of guano. The next farm visited was that of Mr. Bell of Enterkine, who displayed excellent crops of Turnips, Beans, Potatoes, and Oats. After another day spent in examining several other farms, these proceedings terminated. It is right to state, that although each farm did not show the same perfection in every respect, there was much judgment and scientific skill displayed in all, according to the locality, diversity of soil, and mode of farming pursued. We insert the above short account, in order to give publicity to a system worthy the adoption of all Farmers' Clubs; a system of annual visitation of the farms of members, which cannot fail to result in rapid agricultural improvement.

East Cornwall.—At the late meeting of this Society, the president, Goldsworthy Gurney, Esq., opened the discussion by calling attention to the management of Wheat stubbles. He was of opinion that they might be more profitably turned to account than by sowing Turnips, Rape, or lying fallow; he had transplanted Swede Turnips in several of his stubbles experimentally. It was of importance to know how late in the season the planting might be deferred with success, as the harvest this year was unusually early. He had manured some of the transplanted Turnips with guano, some with nitrate of soda, some with bone-dust, some with wood-ashes, and some with farm-yard manure. Those which he had transplanted in his stubbles were looking better than those transplanted in some parts of his fields where Turnips had failed. After some conversation on this subject, a discussion took place on the pickling of Wheat for seed. Mr. Pethick said he had used blue-stone (sulphate of copper) mixed with lime, successfully, for this purpose, about an ounce of blue-stone to the bushel. Mr. Thompson had used arsenic, but it was not effectual; he thought pickling very useful, and approved of the sulphate of copper. Mr. Badcock, St. Stephen's, observed that old Wheat-seed was not subject to smut, but that a greater quantity was necessary; the germinating power of old seed was well known not to be equal to that of new. The chairman remarked that the superior germinating power of new seed was a fact of some importance, particularly in connexion with Swede Turnip cul-

ture. The same year's seed was found so much better in practice that it would be well to get it raised in the south of France, or in some early climate, in time for Turnip sowing in this part of the country; he thought it possible that at Penzance, a place remarkable for its early crops, by a little management, Swede seed might be raised in time—a question worthy the notice of our western neighbours.

Mr. Kingdon begged Mr. Archer to favour the club with some further particulars, referred to last meeting, in connection with his mode of more economically keeping farm-horses. Mr. Archer said his stables were filled with ground-racks, but he did not generally use them; he had his hay and straw cut into chaff, in a loft above: the chaff was then mixed with the usual allowance of corn and let down through a tube to the manger below. The mouth of the tube and the manger were arranged on the principle of the bird-cage fountain, so that the horse could not breathe on, or otherwise injure his food, no more being drawn out than was eaten; by this means he had found 14 lbs. of chaff and two gallons of corn per day sufficient. Mr. Rodd then detailed the result of experiments made at Trebartha, on the field he had placed at the disposal of the committee. He had brought with him specimens of Turnips grown with the different manures recommended. Those from the ground manured with guano alone were far superior to any of the rest; those with bones, next in size; those with guano and sulphuric acid, and those with bone-dust and sulphuric acid, had both been comparative failures, as might be seen by the specimens he had brought with him. He would now detail the result of experiments on a subject introduced by their president, and which he perceived by the public prints had received his name, "Gurneism." He had brought with him specimens of the effects produced by its action, from different kinds of covering, all of which were labelled. The Grass under its influence would be observed to be a foot long, whilst that on the piece of turf, cut from an adjoining portion of the field, uncovered, would be seen to be but two inches in length. The greatest effect, however, had been produced by a basket-work netting. He had not been able to obtain any statistical data of the increase produced by straw, as the piece of ground hurdled off for this purpose had been broken into by his cattle, and the Grass had been eaten; the increase, however, had been great. Mr. Gurney observed that since their last meeting he had made several experiments; some showed the operation of light and shade. He had covered a piece of ground by day, removing the covering every night; vegetation under it was soon much increased, and of a similar appearance to that where the covering was constantly down. The increase was at the rate of 4000 lbs. per acre, in three weeks. On another piece of ground, covered by night, and uncovered by day, vegetation was evidently impaired, and looked unhealthy; there was no increase of Grass whatever. The fibrous covering in both these cases was long oaten straw, laid on at the rate of 20 lbs. to the land-yard.

Westfirle.—On Monday last the meeting of this Club took place. The subject for the evening discussion was, How far, or to what extent, can poor pasture or meadow lands be converted into arable, without raising the price of meat to the consumer?—A member said that he ploughed up four acres of turf which would not keep a sheep. He ploughed with four bullocks, let it lay till spring, raked up and burned the Grass, then ploughed again, and sowed red Globe Turnips, and the produce would keep 200 ewes for two months.—Another member said he thought when land was laid down, it ought to remain so six or seven years, as the accumulation of vegetable matter would be of advantage to the following crops. In Norfolk, where labour was cheap, it was laid down for four or five years.—A member stated that in some parts they laid the land down for two or three years, and then ploughed it again. This was the system on the Cotswold, which is a sheep country. He was of opinion that it was of considerable advantage, and in breaking up he should not take the best or the poorest, as he doubted whether the latter would pay, as the produce would not perhaps be good enough to fatten cattle: in his opinion the old pasture land of England contained the raw material of more grain than the inhabitants could consume. Perhaps one reason why landlords objected to the breaking up of land was, that the tenant found when he entered a farm that the land contained a given quantity of vegetable matter, which was the landlord's property, and it was the tenant's duty to leave the land in the same condition; but if broken up, the landlords feared that the soil would be exhausted and impoverished; but he thought that when land was broken up a higher rent might fairly be expected by the landlord, as the farmer's profits would be considerably increased; he was also of opinion that by laying down other land the produce would likewise be greater; he had broken up land which was not worth above 7*s.* per acre, and it still retained the good quality which pasture land always bears to following crops—it worked better, and yielded better corn than the old arable; he broke up 30 acres and laid down 30 acres, and he found that that which he broke up yielded three times as much as that which he had laid down, but the produce would be larger for a considerable time. There was no question but that the laying down of arable land would do good, as by that means we conveyed to the soil a renewed supply of vegetable matter of which it had been deprived. He was in favour of the alternate system, as he believed the produce would be much greater on both arable and pasture land. The following resolution was adopted:—"It is the opinion of this meeting that many lands at present under pasture, might be broken up with much advantage, inasmuch as their value would be increased to the farmer, and the public would be benefited by the increase of stock and corn. At the same time, this meeting is further of opinion that, as a general practice, the alternate system would be preferable to any method of breaking up without restriction."

Barnet.—A meeting of landowners and farmers residing in this neighbourhood was held on Wednesday last, for the purpose of taking into consideration the injurious character of the existing system of hay selling, and to discuss the plan proposed to be substituted in lieu thereof, through the instrumentality of an Association, projected by some influential hay farmers in this locality. Several startling facts were stated to the meeting, proving the necessity of some exertion being made to lighten the burthen laid upon the hay farmer. From the year 1840 to 1843, the price of hay had been gradually falling, the average price of those years having exhibited a decrease of from 20*s.* to 30*s.* per load; while, on the other hand, the general crops of the last three years did not produce an average quantity. The scarcity of the present year's crop must, of course, cause higher prices, but that was an exception to the general prospect. There was a necessity, then, to see whether any relief could be obtained in the way of diminution in the charges or expenses incurred in the sale of hay. When any complaint on this subject was addressed to salesmen, it was invariably met by the cry of "Oh! look for a reduction of rent;" but, on the contrary, let the farmers see what the salesmen took from their pockets! The salesmen's charges amounted to no less than one-third of the rent of meadow land, or ten per cent. upon an average of the whole crop. This view of the case showed that it not only concerned the tenants, but the landlords also. The extent of the burthen imposed on the hay farmer under the present system, was truly surprising. A year or two ago an attempt was made to reduce the amount of the charges, but this was resisted by the salesmen, and the same per centage which was paid when hay sold from 5*l.* to 10*l.* per load, was still continued when the price of the article had fallen to 70*s.* per load. Believing that an absolute necessity existed that every endeavour should be made to reduce the charges which press so injuriously upon the farmer, several influential persons had attended meetings lately held to devise a remedy which was proposed to be effected through an Association of hay farmers, who would appoint their own salesman, taking upon themselves the responsibility of all sales on credit, abolishing the mischievous practice of throwing the risk of bad debts upon the agent, and providing a fund for prompt payment to those members who might be desirous of immediately receiving the proceeds of the hay sent by them for sale. A general outline of the rules proposed to carry out the intended new system of hay selling was then given, from which it appeared that a considerable reduction of the present charges would be at once effected; while in the event of the Association receiving the extended support of those for whose benefit it was especially designed, the charges would ultimately be reduced to a mere nominal amount. The object was a legitimate one, in which both landlord and tenant were equally concerned; and it was urged strongly upon the attention of the farmers and gentlemen of the neighbourhood.

Reviews.

Practical Instructions for using Guano as a Manure; illustrated by Practical Results. James Clark, 24 and 25, Billiter-street, London.

With the exception of eight or ten pages of original correspondence at the end of it, the contents of this pamphlet are compiled from works already before the public; and amongst these the columns of this Paper have been the fruitful though unacknowledged source of much useful matter. The directions given by Mr. Clark as to the use of guano are sufficiently trustworthy, and the evidence which he has gathered together of its value as a fertiliser is perfectly conclusive. We extract the following as one of his most interesting proofs of this. It is extracted from a letter by Mr. Grieve, of Archerfield, near Haddington:—"I have given you, in the following table, the result of a trial made by me last year, with four different kinds of manure, in growing Swedish Turnips: the manure was applied in the drills, without any moisture, and the Turnips sown on the 20th May, 1843. Where the guano was used they brairded more rapidly, were sooner ready for the hoe, and kept ahead of the others to the 27th November, when they were lifted and carefully weighed. The soil of the field on which they were grown is a dry, friable loam, and had been from time immemorial in Grass, until 1838.

Kinds and quantities of manures used per Scotch acre.	Price of manure per acre.		Weight of Turnips without roots or tops.			Weight of roots and tops.			Weight of rotten Turnips.			Weight of total produce per acre.		
	l.	*s.*	tons.	cwts.	lbs.	tons.	cwts.	lbs.	tons.	cwts.	lbs.	tons.	cwts.	lbs.
Guano, 5 cwts....	2	15	29	17	13	6	12½	11	1	13	17	38	2¾	13
Farm dung 12 carts	3	12	25	7	8	6	15	6	2	12	13	34	14	27
Bones, 26½ bushels	3	3	25	12¼	6	5	12	14	0	14	22	31	6¼	14
Rape-dust, 12 cwts	3	0	22	19¼	22	5	9	0	2	8¼	6	30	17¼	0

On the same field where the Turnips grew, we sowed Wheat on the 17th February, 1844, without manure of any kind: no difference was observed in the Wheat till it came out in the ear. Where the dung was used, it appeared a little taller and stronger in the straw than that with guano; but the guano is decidedly better than either rape-dust or bones."

Miscellaneous.

On the Comparative Advantage of Employing Horses and Oxen in Farm-work.—This is a subject which has excited some controversy among agriculturists. Lord Kames wrote elaborately on it, and was at great pains in showing the superior advantages of employing oxen. His observations and calculations are not suited, in many respects, to the advanced state of husbandry in our day, however valuable they may have been three-quarters of a century ago. The writer of the following essay is situated in a district of Scotland where oxen are not much used in farm-work; but he has for several years past been in the practice of employing them himself; and in the hope that his observations may not be unacceptable to his southern brethren, he has presumed to send them across the Border. Previously to the discovery of shoeing in the ninth century, horses' feet having no protection against the stones and hard ground, and their hoofs not being so durable as those of oxen, the latter almost superseded them in field labour. Even up to the middle of last century, when there were few made roads, and when, consequently, all thoroughfares were nearly impassable for wheel carriages, agricultural produce was carried on the backs of the animals, oxen as well as horses. It may not be altogether out of place or uninteresting here to allude to the plough-team of former days. The manner of yoking oxen in early times seems to have been to fasten the draught gear to the horns. This barbarous practice extended even to a modern date. Lord Kames says—"People differ in the manner of yoking oxen; in some places they are yoked to the tip of the horn, and in some by the root; these modes are visibly inconvenient. When an ox draws by the shoulder like a horse, his head is free, and his motion natural; when yoked by the horns, he lowers his head to the line of the draught, his posture is constrained, and his step short; his neck indeed is strong, but his shoulder is a better fulcrum for the draught." This is very cool reasoning certainly. It was well for the poor brutes that the policy and interest of the master chanced to be accordant with humanity. Until about the end of last century, the ordinary collars were not used; a sort of stuffed bow was fastened round the neck, and the single tree lay on the shoulder, to which were fastened the chains for drawing by. The array of numbers and apparent strength employed in a plough-team would astonish our modern agriculturists. From the earliest times, I presume, up to about the year 1760, as many as from 12 to 20 oxen, and 6 or 8 horses would have been engaged in drawing one plough; this can be partly accounted for otherwise than by the rude and awkward manner of yoking. Before 1770 very little breadth indeed of artificial Grasses was sown. The ground was cropped for a succession of years, until the natural Grasses (what we now term weeds) got thickly and firmly rooted, the growth of which afforded food during the day in summer for the animals, and at mid-day the ploughmen pulled thistles from among the corn for night provender. In winter the horses were allowed about a feed of Oats daily, with Oat-straw; the oxen got the latter only. While thus poorly fed, the animals had not strength in the draught; hence the numbers requisite. The farm which I occupy has been tenanted by my ancestors for many generations. At the time of the Revolution, my great-grandfather, and his son for many years after that, employed 12 working horses and 28 working oxen, one half of each set being yoked to one plough; I now work the same land to better purpose, I presume, with 6 horses and 2 oxen. In further discussing this subject, I shall endeavour to treat it in the order pointed out in the conditions:—1. *The Age and Breed of the Horses and Oxen, and the time at which they are first put to Work.*—Horses in this country are put to work at three years old; they are often from the commencement worked steadily, although it is considered prejudicial to their future development. I am not aware of the breed of the farm-horse in the middle and northern districts of Scotland being recognised by any particular name. The most perfect figure of a draught-horse is that of the Clydesdale breed; he is distinguished by a short compact body and strong broad bone, these properties being characteristic of strength and durability. Oxen are put to work somewhat older than horses, and they are not at the outset so able for steady work; they cannot be depended on before they are four years old. Our work oxen are bred principally in the shires of Angus and Aberdeen. The peculiarities in their figure are, a small head, deep chest, round body, and short legs. The largest sizes, although frequently selected for work, are, I conceive, not the most proper. They have naturally small bones in comparison with the size of the body; hence the strength of the limbs and the weight of the carcass do not always correspond in reckoning them as "beasts of burthen." The weight of my oxen averages about 800 lbs. without the offal, when fed. When much heavier, I find they want activity and endurance, and their feet, from the additional weight, are more apt to give way. 2. *The Condition of Horses and Oxen, the Work performed by each, and its relative Value; Nature of the Soil where worked.*—In all well and economically managed farming establishments, due regard is had to the keeping the horses in good condition. Efficient work can never be performed by ill-fed, ill-groomed animals. The ordinary allowance of food to each horse daily is 16 lbs. of Oats, and as much Oat-straw as he chooses to eat. My oxen get as many Turnips as they can eat. They are fed four times a day, at 5 A.M., 11 A.M., 6 P.M., and half-past 8 P.M., and at each time they eat betwixt them 125 lbs., being in all 500 lbs. daily. I often slice the Turnips for them, especially at mid-day,

when they have little time to eat. They never drink any water even in the hottest days of summer. Both horses and oxen graze in summer; I have not ascertained which of them require the most Grass. In regard to the work performed relatively by horses and oxen, I should say that, except in frost, when the land can not be ploughed, the amount and value of the work performed by each are equal. Many people who work oxen keep 4, and work each pair only one half of the day. This is a most expensive system; and, were a good selection of the oxen to be made, is quite unnecessary. I never keep more than 2 at one time, and they work 10 hours a-day as steadily all the year over, except in frost, as the horses, and keep in perfectly good condition. We often see oxen going very slow and sluggardly at work; when well trained, and of a proper breed and size, they will step out as well and as fast as horses: mine do so. At a late ploughing-match in the district, where upwards of 70 ploughs started, my ox-team was second off the field. The average period when frost prevents ploughing may be stated at six weeks. During this time, except in the threshing-mill, oxen are unemployed. The horses are then engaged in carting dung, earth, &c. By calculating the work of the pair of horses, without the man's wages, as worth 6*s*. a day, and allowing 1*l*. 16*s* as the value of the threshing-mill work performed by the oxen during frost, we have the sum of 9*l*. standing against the latter. It will not do to listen to statements partly speculative and hypothetical, about the capabilities of oxen for drawing wheel-carriages; it is enough for our purpose at present to know that they are not so employed; they are, in the time of frost at all events, unsuited for such a purpose. The soil best fitted for oxen to tread on is that which is dry and most free from stones. My farm is composed of both clay and black soil, some of the former of which is rather wet, but there are very few stones anywhere. My oxen, although unshod, and working as I have said steadily, never get the least lame, or suffer in the slightest in their feet. On another farm, however, which I occupy, where the soil is more of a clayey nature, and somewhat wet and stony, the hoofs of the oxen wore, and became tender, and rendered them unfit for steady work. Attempts have been made to shoe them in such circumstances, but the experiment seldom proved satisfactory. The conclusion to which I have come is, that oxen cannot by any management or precaution be profitably employed on wet or stony soil. 3. *The Cost of Maintenance and Farriery of each Pair of Horses and Oxen, including the separate Charge of Management.*—A horse getting 16 lbs. of Oats daily will eat in seven months (the period he requires grain) about 10½ quarters, which in value amounts to nine guineas. A horse wears 5 or 6 sets of shoes annually, which cost 18*s*.; other 5*s*. will be allowance enough for medicine. In regard to the cost of maintaining working oxen on green food, such as Turnips, I have to remark, that the price of that article varies according to the locality where it is grown. I shall reckon the price or value of the ton of Turnips at 10*s*., being the average in an inland district. I have repeatedly ascertained, both now and formerly, the exact quantity of Turnips which oxen eat, and find that two daily consume about 500 lbs., being at the rate of a ton in four and a half days, or 47 tons in seven months (the time they require Turnips), which in value amounts to 23*l*. 10*s*. I make no calculation on the cost of straw. I believe the quantity eaten by a horse and ox to be about equal. The charge of management of horses and oxen is the same. One man has the charge of a pair, and all must be groomed and otherwise attended to alike. 4. *The Cost or presumed Value of each Pair of Horses and Oxen with their Gear, when put to work, and their Value at the end of the Comparison.*—A pair of farm-horses, four years old, suitable for all kinds of work, can be bought for 56*l*. Their gear or harness, including the cost of keeping it in repair, amounts to 25*s*. yearly. Should no accident occur a horse will last twelve years, at the end of which time he is worth about 6*l*. Including the difference between the original purchase and ultimate selling price, together with interest, the sum of 3*l*. 10*s*. is thus lost annually on each horse. There should be added to this at least 30*s*. to cover accidents and deaths. A pair of oxen, four years old, costs 26*l*. The last pair which I bought cost 24*l*. They have worked regularly for four years, and I am now feeding them for slaughter. I expect to get about 30*l*. for them. They work one day a week at the threshing-mill, which does not seem to retard their feeding. I would therefore calculate that no actual loss will be sustained on oxen from the time of their being bought and sold. The cost of gear, including keeping in repair, costs 10*s*. annually. The account of the different items stands thus:—

Expenditure, &c., on a working horse yearly.

	£	s.	d.
To 10½ quarters of Oats, at 18*s*.	9	9	0
To deterioration in value, interest on outlay, losses by accidents and death	5	0	0
To shoeing and medical attendance	1	3	0
To furnishing and repairing gear	1	5	0
	£16	17	0

Expenditure, &c., on a working ox yearly.

To 23½ tons of Turnips at 10*s*. per ton	11	15	0
To furnishing and repairing gear	0	10	0
To loss on his work during frost	4	10	0
To interest on purchase price	0	15	0
	£17	10	0

In the above table, I have calculated the Oats given to the horses at the market price; but the cleanings and inferior grain, which cannot be otherwise disposed of, constitute a considerable portion of their food, and thus the cost on this item can be reduced; otherwise the figures above so nearly correspond, that it rests with the partiality of parties whether they shall employ horses or oxen, or partly both. For my own part, after duly considering the matter, and after the experience of a number of years, I should give the preference to employing horses exclusively. They are ready at all times for all kinds of work; in wet or frosty weather they can be employed in carting, and in leading the crop in harvest they are invaluable and indispensable, while at all these times the oxen are "eating the bread of idleness."—*Prize Essay in the English Agricultural Society's Journal, by J. Cowie, Laurencekirk, N. B.*

Notices to Correspondents.

Books.—*J. K.*—Reid's "Chemistry of Nature," Glasgow.

Chaff-cutter.—*Toby* and *A Subscriber*—The price of these implements, of the small size, for one man, may vary from 6*l*. to 10*l*. They will cut, perhaps, three different heights. We cannot select and name the firm from which you should buy. You must ascertain this elsewhere.

Failure in Seeds.—*J. Robinson.*—We are afraid it is too late now to sow Italian Rye-grass, which would probably have been your best remedy, could you have applied it in August. If your seeds are a failure, you had better plough up and sow winter Vetches.

Failure on the Cotswolds.—*G.*—You have mistaken the character of the soil on the Cotswold hills. It is a poor, thin, brashy, calcareous soil; certainly not overburdened with nitrogenous manures. No cheese is made there—that is all manufactured on the pasture lands in the vale. Turnips are sown broadcast; but the farmers rarely use artificial manures: they depend chiefly on what is made at home in their farm-yards. Your argument as to the cause of failure, you will thus see does not avail you. The Turnips have failed more likely from want than excess of manure.

Gorse.—*Melksham.*—See Nos. 5, 6, 9, and 10, of the *Agricultural Gazette.*

Indian Corn.—*An Inquirer.*—Your idea of the want of gluten in this grain, as compared with Wheat, we have always considered correct. We do not know on what authority Mr. Gyde states it to contain so much. Payen, as quoted by Professor Johnston, found nearly 5 per cent. of gluten in Maize; but his analysis, from its obvious inaccuracy in other matters, Mr. Johnston says is not to be depended upon.

Operation on the Snouts of Pigs.—*W. D. F.*—There are two tendons, which, with their parent muscles, elevate the snout, and endow it with the power of rooting up the earth. These tendons may be divided about 1½ inch from the nose. A piece of each should be cut out, and the wound kept open a while by means of tow: a simple division of them would answer no end, as they would soon unite again; but by cutting out a portion, their power would be diminished.——*W. C. S.*—See No. 5 *Agricultural Gazette.* It is evidently a more cruel operation than that of ringing.

Sea-sand.—*J. White.*—Large quantities are used; you will find it expensive to apply per acre an equal quantity of lime in bone-dust; it will answer as well, but the expense will render it unadvisable. If you apply lime along with guano, you will expel much of the ammonia which the latter contains. Lime is useful on soils which do not contain it. Guano or some other source of phosphorus, ammonia, &c., is also necessary on such as well as on others; but the two must be applied at separate times; apply lime in autumn, and guano in spring. Salt would be useful on your soil, if you are far inland, and you may apply it with your bones and acid or otherwise, at the rate of 1½ or 2 cwt. per acre. The mode of its application does not signify, provided it be evenly spread in wet weather.

Sulphate of Iron.—*Original Subscriber.*—It will decompose carbonate of ammonia, as soon as it is formed in urine. We shall be better able next week to say what effect it would have on the feet of animals in a house.

Weeds.—*A. Langdon.*—We have to apologise for delay. Your Weed can be extirpated only by perseverance in pulling it, and destroying it in all possible ways. It is very rarely indeed that the farmer knows of any easy way to destroy weeds, or indeed of any other way than sheer industry and perseverance in pulling them up.

*** As usual many communications have been received too late.

Markets.

SMITHFIELD, Monday, Sept. 30.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	10	to 4s	0	Best Downs & Half-breds	3s 8 to 3s 10
Best Short Horns	3	8		3	10	Best Long-wools	3 6	3 8
Second quality Beasts	2	8		3	4	Ewes and second quality	3 0	3 6
Calves	3	4		4	0	Lambs	3 8	4 4
Pigs	3	4		4	0			

Beasts, 3956; Sheep and Lambs, 26,230; Calves, 117; Pigs, 370.

Our supply of Beasts to day is unusually large, still the best qualities are not over-abundant, and maintain Friday's prices; trade for all other qualities is excessively bad—this being Michaelmas Market, very little is wanted; several middling Beasts remain unsold. There is also a considerable increase in the supply of and decrease in the demand for Sheep; trade is very heavy at a reduction of about 2d per 8 lbs. on the general trade, although in some few instances the best Downs make 4s, and Longwools 3s 10d. There are fewer Lambs; they are a little more in demand, but make no more money. Veal-trade is heavy; middling Calves are very low. Pork is about the same.

Friday, Oct. 4.

The supply of Beasts is large, and demand very small: the best qualities barely maintain Monday's quotations, and it is difficult at all to dispose of the inferior; a large number must remain unsold. Although the number of Sheep is considerably less, there is more than sufficient for the demand, and the prices are a trifle lower than on Monday; the trade at the dead markets having been so excessively bad since Monday causes a very slack attendance of buyers here to-day. Veal trade is also rather worse; the very best Calves barely make 4s, and a great many inferior quality make no more than from 3s to 3s 4d. Pork-trade is steady at late quotations.

Beasts, 831; Sheep and Lambs, 6110; Calves, 248; Pigs, 380.

41. West Smithfield.

POTATOES.—Southwark Waterside, Sept. 30.

There have been three or four small lots of Jersey Whites sold at 50s per ton, and if sales had been pressed, lower prices would have been the consequence; there has also been some small lots of Whites from Lincolnshire, and a few barges from Kent, yet the number of arrivals has been inconsiderable, and the demand inactive—but at present there has been nothing to draw the Trade to the Waterside.

HAY.—Per Load of 36 Trusses.

Smithfield, Oct. 3.

WOOL.—British, Friday, Oct. 4.

There has been but little doing during the past week. Combing Wools continue of dull sale, and we have heard of a slight reduction in price having been submitted to in some cases. The market for Short Wools has hardly been so good, but prices have not varied.

HOPS, Friday, Oct. 4.

The Market is very active, and prices have advanced 2*s* to 4*s* per cwt. since last week. The duty is still estimated at 13 ,,*l*.

Paterndes & Smith, Hop-Factors.

MARK-LANE, Monday, Sept. 30.

There was a fair supply of Wheat from Essex and Suffolk this morning; that from Kent was large; the condition of all is much better than it has been since harvest, and met a tolerably free sale at 1*s*. per qr. above the prices of this day se'nnight. Foreign was also in improved demand at a similar advance. Canadian and American Flour is rather more inquired after at our quotations.—Malting Barley is readily taken off at the prices of last week; secondary and grinding qualities are neglected.—The value of Beans and Peas remain unaltered from last week.—The Oat-trade is firm, and rather more money is obtained for retail quantities, but the dealers are holding off for larger arrivals.

Friday, Oct. 4.

Having but a small attendance at Market this morning, the amount of business transacted has been limited; prices of Wheat, both English and Foreign, are firmly maintained.—Malting Barley sells freely at our quotations, but grinding qualities are neglected.—In Beans and Peas there is no alteration.—A few Irish vessels with Oats have got up this morning, but having few country buyers, and the dealers holding off for further arrivals, a moderate business only was done in this article at late rates.

Kingsford and Lay.

COVENT GARDEN, Oct. 5.—There has been little variation in the prices of most articles during the past week; the market has been well supplied, but trade continues dull. Pine-Apples are sufficient for the demand; among them there are many handsome fruit. Melons continue to be supplied in tolerable abundance; and Grapes are very plentiful. Peaches and Nectarines are becoming scarce; a few good samples, however, still remain, and they appear to be pretty good. The chief dessert Plums are Coe's Golden Drop, and the Imperatrice, which fetch about 1*s*. 6*d*. per punnet. Of Apples and Pears of good quality there is abundance offered at last weeks' prices; they consist exactly of the same kinds as are mentioned in our last weekly report. Hothouse Grapes are nearly the same as last week; Spanish varieties are a little cheaper. Very few Oranges are in the Market, and Filberts still continue scarce. Of Vegetables, generally speaking, there are plenty; Broccoli, of which a considerable quantity is in the Market, is becoming more plentiful. It is very good and cheap. Cauliflowers are scarce, as are also Cabbages. Brussels Sprouts are getting more plentiful, and Carrots and Turnips are supplied in considerable quantity. French Beans are scarce, and are in consequence getting dearer. A few samples of Peas may still be met with, which are tolerably good in quality. Onions are large and fine, as is also Celery. Lettuces and other Salading are sufficient for the demand. Cut Flowers chiefly consist of Ceanothus azureus, Gladiolus psittacinus, Pelargoniums, Phloxes, Heaths, Verbenas, Fuchsias, Amaryllises, Camellias, Carnations and Roses.

FRUITS.

Pine Apple, per lb., 3*s* to 5*s*
Grapes, Hothouse, p. lb., 1*s* to 2*s*
— Spanish, per lb., 1*s* to 1*s* 3*d*

TO NOBLEMEN, GENTLEMEN, TRUSTEES OF LANDED PROPERTY, and OTHERS.

MESSRS. BROOKS and GREEN have an opportunity of introducing a Gentleman who has been accustomed for many years to superintend the Farming Department of an extensive Estate, and thoroughly understands the most approved principles of Agriculture, Breeding, and Management of Stock, and who now wishes to devote a great portion of his time for the same purpose in any of the Midland Counties. Satisfactory references will be given, both as regards capability and integrity, by addressing to Messrs. BROOKS and GREEN, Estate Agents, Surveyors, and Auctioneers, 28, Old Bond street.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery: they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

WHEAT-SOWING.

GUANO; Genuine Peruvian, Bolivian, and Ichaboe, on Sale; also Potter's Guano, Gypsum, Sulphuric Acid, Sulphates of Iron and Copper, and all other manures. Synopsis of prices, and mode of use, on application, &c.—Apply to MARK FOTHERGILL, 40, Upper Thames-street.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Oct. 4, 1844.

GUANO for SALE, in Bags of 1 cwt. each, just landed, with a succession of cargoes to arrive.—Successive years' experience has unquestionably proved that Genuine Guano is the simplest, cheapest, and best Manure within the reach of the Agriculturist. The only reasonable anxiety which now remains is to procure the Guano unadulterated, and to obtain such practical directions for using the Manure as shall fully develop its productive powers. To secure to buyers these indispensable requisites, with each purchase will be given a warranted chemical analysis of quality, and also a copy of the recently-published Pamphlet, "Practical Instructions for using Guano as a Manure, illustrated by Practical Results."

Large parcels will be delivered direct from the ship or waterside premises; smaller quantities may be had at the warehouses, 24 and 25, Billiter-street, or delivered within any reasonable distance at a trifling additional cost. Apply to JAMES CLARK, 24, Billiter-street.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, Oct. 4, 1844:—

Bones.	.	p. ton	£4	10s.	0d	Nit. of Potash	p. cwt. £1 4s. 6d
,, crushed,	5l. 10s. to		6	0	0	Oil of Vitriol, or Sulph.

Nitrate of Soda,	p. cwt.		0	14	9		

WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

POTTER'S GUANO MANURE is the only Guano that can positively be depended upon, and has stood the test of three seasons. The imported article, it is well known, is seldom twice alike, even when genuine, and is subject to a most extensive system of adulteration. Orders addressed early to the Works, 28, Upper Fore-street, Lambeth, will have instant attention. Testimonials will be sent per post, if required.

POTTER'S LIQUID GUANO may be had as usual of most Chemists and Seedsmen.

*** Beware of being imposed upon by inefficacious imitations.

WHEAT-SOWING.

FREDERICK BRAIN begs to call the attention of the Agricultural world to his GUANO MANURE, prepared expressly for Wheat crops: it abounds in all the ingredients that are necessary for a good grain crop. He particularly solicits persons who found the Foreign Guano a failure last season to give his a trial, it being much more powerful, and free from adulteration, so justly complained of in the Foreign by Agriculturists, as well as by all the leading Agricultural Journals.

Testimonial to Brain's Guano Manure.—"5A, Hawley Road, Kentish Town, London, Aug. 15, 1844.—This is to certify that we have subjected Brain's Guano to a most patient and rigorous analysis, and find it contains all the necessary constituents of a good manure, and is well calculated to give fertility to a soil which is either naturally barren, or has been exhausted by over-cropping, by supplying the land with those substances which are absolutely requisite to a healthy vegetation: (it is not adulterated, and can always be depended on, being of uniform composition.)—(Signed) JOHN MITCHELL and FREDERICK FIELD, Analytical Chemists, late of the Royal Polytechnic Institution, London."

Also, BRAIN'S highly-concentrated LIQUID GUANO, for Grass Lands, Gardens, Shrubberies, Hothouses, and Conservatories, price 1s. 9d. per quart bottle, with full directions for use, (enough for 80 gallons of Liquid Manure), to be had of most respectable Florists, Seedsmen, and Chemists in town and country.

Works, Thomas-st., Duke-st., Stamford-st., Blackfriars-road.

SEED WHEAT.

J. D. PIPER, of Colne Engaine, Essex, (Member of the Royal Agricultural Society), has been four years raising two new Stocks of Wheat, viz., Piper's "Thick-set," and "Colne Whitechaff Red." At the last Southampton Meeting two sheaves of these Wheats were exhibited outside (notice not having been given in time for their admission inside), where they produced much excitement, and 6d. per ear was offered for them. Last year, in the same field, side by side, the Piper's Thick-set grew eight bushels and a half, and the Colne Whitechaff Red five bushels and a half more per acre than the most prolific Wheat grown in the neighbourhood. Last autumn J. D. P. measured a quarter of an acre off his field, and dibbled the Thick-set in rows a foot apart, and one bushel per acre; and though the plant was partially destroyed by the slug in the winter, and a good sprinkling of self-sown Potatoes were left to grow, still the yield was 14 bushels and a half, being equal to 14 sacks and 2 bushels per acre. One person this year grew 15 sacks and 2 bushels, another 14 sacks, and another 13 sacks per acre. One parcel weighed 64½ lbs. per bushel. This is, perhaps, the stiffest-strawed Wheat in England, and is adapted for strong or hollow bottom ground, and is not likely to get laid. J. D. P. will send to London, or to any place within ten miles of Colne, carriage free, and he will be glad to receive a post-office order, or reference to some house in London for the money, with the order for the Wheat. When it is all sold, J. D. P. promises to inform the Public, by an advertisement in this Paper; but if he should get any post-office orders after it is all sold, he will return them. The price is regulated according to the yield. Thick-set, 15s. per bushel; Colne Whitechaff Red, 9s. per bushel. Samples of the above, both threshed and in the straw, may be seen at our Office. N.B.—J. D. P. advertised in the two principal papers in Essex, where the above Wheat was growing, in order that Agriculturists might see it and judge for themselves of the quality and quantity.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIELD (late Mr. Mitchell's, Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No. 5A, Hawley-road, Kentish Town.

70, STRAND, LONDON.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN BASINS IN IRON, &c.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

WATER RAM.

TO LANDOWNERS, AGRICULTURISTS, BUILDERS, &c.

McKIBBIN'S Improved ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY.

The disadvantages attending other materials used in roofing, preventing, to a great extent many useful houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will in a great measure—and in some instances altogether—obviate them, and prove most serviceable from its lightness, durability, and impermeability to water and damp, in covering Houses, Cattle-sheds, Workshops, Ropewalks, &c., and for the sides, as well as roofs, of light structures for plants, being likewise a non-conductor of heat; besides its economy in repairs, the timber where it is used may be so light as to save its whole expense; it requires no other coping, and may be applied by any person of common ingenuity; being flexible and portable also, it is free from breakage, the expense of carriage is inconsiderable in comparison with slates, tiles, &c., and it is not liable to contraction like zinc.

Sold in sheets 32 inches by 20, at 5d. each (being less than 9s. 6d. per square of 100 feet), with printed directions for applying them, same as adopted at the Government Dock-yards and various other public buildings.

Orders will meet with prompt attention if addressed to H. C. BOWDEN, 18, East India Chambers, Leadenhall-street, London, or to the following agents:—Liverpool, Messrs. Grueber & Co., 11, Manesty-lane; Plymouth, Thomas Stevens, Esq.; Birmingham, William R. Loyd, Esq.; Sunderland and Newcastle-on-Tyne, Messrs. John Ritson and Sons; Hull, William Ward, Esq.; Bristol, Messrs. Moor and Hewitts; Ramsgate and Deal, Messrs. Edward Hodges & Co.; Whitehaven, William Todd, Esq.; Glasgow, Malcolm Carmichael, Esq., St. Enoch-square; Cork, Messrs. Richard Wallis & Co.; Belfast, Messrs. Grueber & Co., Dunbar's Dock; who have also on sale McKIBBIN'S improved SHEATHING, BOILER, RAILWAY, and other FELT.

*** The "IMPROVED ROOFING FELT" will be found much more durable than the Common Felt made in lengths, and not subject, like it or continuous sheets of other material, to be stripped by storm; it can also be more easily repaired, and from the simple mode of application recommended, the wet cannot percolate through nail-holes, being only fastened down at the overlaps.

J. R. AND A. RANSOME, Ipswich, have published a Descriptive Catalogue, with Cuts, of their AGRICULTURAL IMPLEMENTS and MACHINES, which may be had by post, the order being accompanied by six penny stamps.

PORTER'S GALVANIZED CORRUGATED AND PLAIN IRON ROOFING, and IRON BUNDLE and FENCE WORKS, Grove, Southwark. The Patent Galvanized Iron Co's (Sorel's) process, is now being used for the Roofing of the New Houses of Parliament; at Woolwich Dockyard, by the Trinity Board, &c. It is particularly suited for the Colonies, and is shipped by J. PORTER to the East and West Indies, Ceylon, &c; also supplied by him to several English, and to the Jamaica Railway Companies. Mr. Fencing, Sheds and Pens, Farmyard and Fireproof Buildings of all kinds. A new description of Galvanized Iron Open Gutter covered with tile for the circulation of hot water, much cheaper than any other kind. The Trade supplied with Corrugated Plates, Galvanized or not, and with Iron Fences of all kinds.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings, its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1d. per foot, super. A discount to the trade. THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

EXTIRPATION of all kinds of VERMIN.—Office, 69, King William-street, City, London.—Mr. J. A. MEYER, practical chymist, patronised by Her Majesty the Queen, H.R.H. the Duchess of Kent, the Royal Agricultural Society of England, and the Corporation of the City of London, and by special appointments to the principal Courts of Europe, begs to inform the nobility, gentry, merchants, agriculturists, shipowners, and the public generally, that he continues to CLEANSE, by contract, from one to five years, every description of PROPERTY, of rats, mice, moles, weasels, moths, fleas, bugs, &c., and as a guarantee of the efficacy of his preparation, respectfully refers to the certificates of his great success at Buckingham Palace and Gardens, Windsor Castle, St. James's Palace, Frogmore Lodge, Carlton Club House, Mansion House, Newgate Prison, Tavistock Hotel, Brewers, Chester, and Galley Quays and warehouses in Lower Thames-street, the property of Joseph Barber, Esq., and many others of public and private establishments, which may be seen at the office. The preparations, which are free of poison or deleterious drugs, may be had as above, in pots and bottles at 5s., 10s., 20s., 50s., and 100s. each, with full directions, which must be used in proportion to the extent of premises infested, to successfully eradicate the vermin, and which can be applied without injury to property. Dwelling-houses cleansed from 1l. to 5l. per annum; mansions and estates from 10l. and upwards; ships, docks, warehouses, granaries, breweries, farms, wharfs, &c., in proportion. Caution.—None are genuine unless bearing the signature and seal "Joseph Anton Meyer."

TO COLONISTS, EMIGRANTS, &c. — Mrs. MARY WEDLAKE, widow of the late THOMAS WEDLAKE, at 118, FENCHURCH STREET, CITY, informs Emigrants and others that she continues to manufacture those Agricultural Implements for which her late husband was so extensively patronised by the Settlers of South Australia, Van Diemen's Land, Swan River, New Zealand, and other British Colonies. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, viz.:—

Patent Hay-making Machines	Flour Mills—Bean Mills
Dressing Machines	Patent Essex Ploughs, 30 sorts
Patent Chaff-cutting Machines	Subsoil Ploughs [Colonies
Oil-Cake Crushers	Threshing Machines for the
Double action Turnip-cutters	Drills of all kinds—Scarifiers
Railway Wheels	Vacuum Pumps

Please to be particular in the address, MARY WEDLAKE, 118, Fenchurch Street, London.

REAL SHEFFIELD PLATED DISH COVERS, at prices hitherto unattempted. THOMAS WEST, 18, Ludgate-street, London, having received a large supply direct from the manufactory at Sheffield, offers the best Meat Dish Covers as follow:—Cottage Pattern—1 Cover of 20 inches, 3l. 15s.; 1 do. of 18 inches, 3l. 3s.; 2 do. of 14 inches, 4l. 8s.; the set of 4, complete, 11l. 10s. ONLY. Double Dome Pattern—1 Cover of 20 in., 4l. 16s.; 1 do. of 18 inches, 3l. 19s.; 2 do. of 14 inches, 5l. 5s.; the set of 4, complete, 14l. ONLY. In noticing the prices of the above goods, T. W. ventures to assert they are superior to many advertised at a much higher price. Best Wrought Silver Spoons and Forks as usual, Fiddle Pattern, 7s. 2d. per oz.; Queen's Pattern, 7s. 4d. per oz. Superior Watches and Fine Gold Jewellery, cheaper than any house in London. West's Hand-book, with 100 engravings, and full of useful information, is just published, and may be had gratis, and post free, on application to T. WEST, Silversmith, 18, Ludgate-street, London.

HORIZONTAL WATCHES, very flat.—A. B. SAVORY and SONS, Watchmakers, 9, Cornhill, London, opposite the Bank. Price, in silver cases, three and a half guineas each; or in gold cases, six guineas each. These Watches are accurate and durable, the horizontal escapement being peculiarly suited to combine those important requisites. They are jewelled in four holes, and continue going whilst being wound. A twelvemonth's warranty given with each.

TERRA COTTA FIGURES, VASES, FOUNTAINS, &c. Manufactured by DOULTON and WATTS, LAMBETH POTTERY, High-street, Lambeth, London.

D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, the superiority of which over Artificial Stone or Cement is well known. It is subjected to a high degree of fire, which renders it imperishable, and gives it a sharpness and surface which no changes of temperature can impair.

D. and W. are enabled to offer the Terra Cotta at a considerable reduction in price; and Drawings and Designs will be forwarded Gratis, on application.—Architectural work executed.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

THE WORKS OF G. P. R. JAMES, ESQ.

On the 1st October was published the second volume of the NEW and ILLUSTRATED EDITION of Mr. JAMES'S WORKS, comprising the whole of the celebrated Historical Narrative entitled

THE NEW QUARTERLY REVIEW AND HOME, FOREIGN, and COLONIAL JOURNAL, No. VIII.

CONTENTS:

1. Erastus and the Scottish Church Establishment.—2. Werner as Infidel, Romanist, and Poet.—3. Revelations of Russia; or the Emperor Nicholas and his Empire in 1844.—4. Present State of Morocco.—5. German, English, and American Essays.—6. The Miscellaneous Works of Oliver Goldsmith.—7. State of Portugal.—8. New Zealand.—9. Present Position of England and France. Critical Sketches, Correspondence, Literary Notices, and List of Books.

London: SMITH, ELDER, and Co., 65, Cornhill.

MR. HOARE'S NEW WORK ON THE VINE.

Just published, 12mo, 5s. cloth,

A DESCRIPTIVE ACCOUNT OF A NEW METHOD OF PLANTING AND MANAGING THE ROOTS OF GRAPE-VINES. By CLEMENT HOARE, Author of "A Treatise on the Cultivation of the Grape-Vine on Open Walls."

"Mr. Hoare maintains that the system of English Grape-growing requires to be changed. His arguments deserve very serious attention, and cannot fail to lead to most important changes in the cultivation of the Vine."—*Gardeners' Chronicle.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

In one vol., post 8vo, price 10s., cloth lettered,

VEGETABLE PHYSIOLOGY and BOTANY, including the Structure and Organs of Plants, their Characters, Uses, Geographical Distribution, and Classification, according to the Natural System of Botany. By W. B. CARPENTER, M.D., F.R.S.

In one vol., post 8vo, price 10s. 6d., cloth lettered,

ANIMAL PHYSIOLOGY: including a comprehensive Sketch of the Principal Forms of Animal Structure. By W. B. CARPENTER, M.D., F.R.S. With several hundred Engravings on Copper and Wood, drawn under the direction of M. MILNE EDWARDS, for his "Cours Elémentaire de Physiologie." In two vols., post 8vo, price One Guinea,

ZOOLOGY AND INSTINCT IN ANIMALS: a Systematic View of the Structure, Habits, Instincts, and Uses of the Principal Families of the Animal Kingdom, and the Chief Forms of Fossil Remains. By W. B. CARPENTER, M.D., F.R.S.

In one vol., post 8vo, price 9s. 6d. cloth lettered,

MECHANICAL PHILOSOPHY, HOROLOGY, and ASTRONOMY: being an Exposition of the properties of Matter, Instruments for Measuring Time, and a Description of the Heavenly Bodies. By W. B. CARPENTER, M.D., F.R.S. London: W. S. ORR & Co., Paternoster-row.

Just published, the Fourteenth Edition, price 2s. 6d.; free by post, 3s. 6d.,

THE SILENT FRIEND ON NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. PERRY and Co., Surgeons, London. Published by the Authors, and sold at their residence; also by Strange, 21, Paternoster-row; Noble, 109, Chancery-lane; Hannay and Co., 63, Oxford-street; Gordon, 146, Leadenhall-st.; Purkiss, Compton-st., Soho, London.

OPINIONS OF THE PRESS.

"This work should be read by all who value health and wish to enjoy life, for the truisms therein contained defy all doubt."—*Farmers' Journal.*

The Cordial Balm of Syriacum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11s. and 33s. PERRY'S Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with, or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2s. 9d., 4s. 6d., and 11s., by all Medicine Venders.

Messrs. PERRY and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

CONTENTS of the NUMBER for SATURDAY last, SEPTEMBER 28, OF

Order The Railway Chronicle of any Newsvender.

NEW WORK BY PROFESSOR LOW.

Just ready, 8vo with very numerous Illustrations on Wood,

ON LANDED PROPERTY and the ECONOMY of ESTATES: comprehending the relation of Landlord and Tenant, and the Principles and Forms of Leases; Farm-Buildings, Inclosures, Drains, Embankments, Roads, and other Rural Works; Minerals, and Woods. By DAVID LOW, Esq., F.R.S.E., Professor of Agriculture in the University of Edinburgh, &c., &c.

By the same Author, 4th Edition, 8vo, 21s.,

ELEMENTS OF PRACTICAL AGRICULTURE. THE BREEDS OF THE DOMESTICATED ANIMALS OF GREAT BRITAIN. 2 vols. 4to, with 56 coloured Plates, 16l. 16s.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

LITERARY LEAVES; or, Prose and Verse. By DAVID LESTER RICHARDSON.

2 vols. 8vo, Second Edition, price 12s.

"We strongly recommend this second and enlarged edition. We can easily imagine how such writings as these, appearing from time to time in the Indian journals, must have gratified the English residents, since even here, in the midst of lions and new books, we run over the leaves with unmixed pleasure."—*Atlas.*

"His poetry derives, from his unfeigned attachment to home, a very touching beauty. Most persons who have been long absent from the place of their birth know how delicious is the feeling with which it is approached. Mr. Richardson describes this feeling with exquisite truth and tenderness .... Whatever forms of nature challenge his preference, he views them all with a poetical eye, and paints them in his verses with vividness and fidelity. We should be glad to see the poetry of these volumes detached from the prose, and sent into the world alone. It has sufficient character in it to depend on its own vitality; and we venture to predict that it will live."—*Sunday Times.*

"The essays afford some exquisite reading. We can with perfect confidence refer every man of literary taste to these volumes, which we consider an elegant and valuable contribution to the literature of our country."—*Indian News.*

"The poems are largely impregnated with Nature's best and holiest feelings. They are utterances of the writer's own heart, and they reach the hearts of his readers. They leave an impression which will not be easily or speedily effaced. The diction is in keeping with the sentiments; it is at once accurate and graceful. The same observation applies to the author's prose writings."—*Observer.*

SMITH, ELDER, AND Co., Cornhill, London.

This day (to be continued Quarterly), price 2s 6d., A GENERAL

POLICE AND CONSTABULARY LIST, AND ANALYSIS OF CRIMINAL AND POLICE STATISTICS. Compiled, by permission, from Official Documents.

SATURDAY, OCTOBER 5, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—
Trustees.—Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

BRITISH MUTUAL LIFE ASSURANCE SOCIETY,
17, NEW BRIDGE STREET, BLACKFRIARS.

Directors.

John Atkinson, Esq., Well-st., Hackney.
Joshua Burgess, Esq., Park-st., Grosvenor-square.
George Godwin, Esq., F.R.S., F.S.A., Pelham Crescent, Brompton.
Captain C. Twisleton Graves, Army and Navy Club.
Nutter Gray, Esq., Hackney.
Thomas Hamber, Esq., Barnsbury Park.
John Lodge, Esq., Portman-st., Portman Square.
Robt. Remmett, Esq., Temple.
John Richards, Jun., Esq., F.S.A., Mayor of Reading.
George Alfred Walker, Esq., St. James's Place.

Auditor—Joseph Peill, Esq.
Bankers—Messrs. Masterman & Co., Nicholas-lane, Lombard-st.
Physician—R. Hopkins Allnatt, Esq., M.D., F.S.A., Parliament-st.
Surgeon—Robert Grueber Shute, Esq., Mecklenburg-sq.
Standing Counsel—Harris Prendergast, Esq., Lincoln's Inn; Joseph Brown, Esq., Temple.
Solicitor—Edward Smith, Esq., 5, Chancery Lane.
Surveyor—John Barnett, Esq., Chancery Lane.
Consulting Actuary—W. Ratray, Esq., King William-st., City.

THE GREATEST PRESENT BENEFIT, AND THE GREATEST FUTURE ADVANTAGES to those who attain the average duration of Life are secured to the Assured in this Office, *a combination of advantages presented by no other in London.*

This Society is strictly a Mutual Assurance Society.

The principle adopted in the distribution of the profits is *peculiar to this Office*, and is at once safe, equitable, and favourable to good lives. The surplus is reserved for those Members who survive the period at which their premiums, with accumulated interest at 5 per cent., shall amount to the sums assured, and may be received in cash, or applied in the reduction of the future premiums, or to the increase of the sum assured.

An ample Guarantee is secured by a temporary subscribed Capital to be paid off as soon as it may be deemed expedient.

The Premiums are deduced from the Government experience, and are accurately adjusted to the several ages. At early and middle life they are about *one-fourth lower than at most other offices.*

All the objects of Life Assurance may be effectually accomplished at this Office, and generally the Directors are prepared to receive proposals of any description involving the contingency of human life.

More fully to extend the advantages of the Society, it is determined to establish LOCAL BOARDS throughout the Kingdom.

Every facility and information afforded on application at the Office, 17, New Bridge-street, Blackfriars,

CHARLES JAMES THICKE,
Resident Secretary.

17, New Bridge-street.

LIFE ASSURANCE.—The following are specimens of the low Rates of Premium charged by the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY.

Age.	20	30	40	50	60
An. Pr.	£1 10 3	£2 0 7	£2 15 3	£4 1 8	£6 3 9

and of these Premiums one-third may remain unpaid, in the hands of the assured, at interest to be deducted from the sums assured, when they become claims.

Persons assured to the amount of £500 for the whole term of life, participate in the profits of the Company. Subscribed Capital £200,000.

For Forms of Proposal and other particulars, apply at the Office, 126, Bishopsgate-street, corner of Cornhill, City.

LONDON, EDINBURGH, and DUBLIN LIFE ASSURANCE, 3, Charlotte-row, Mansion-house, and 18, Chancery-lane, London.

The more than usual success which has attended this Company has arisen—

From the combination of advantages formerly obtainable partly from proprietary and partly from mutual societies, thereby affording to the assured bonuses, reduction of future premiums, and complete freedom from responsibility.

From the indisputability of the policies, leave to travel beyond Europe, the option of payment of one-half the premiums for the first years, and immediate settlement of claims.

Prospectuses and rates forwarded by the Agents and Manager. ALEX. ROBERTSON, Manager.

COMMERCIAL and GENERAL LIFE ASSURANCE, ANNUITY, FAMILY ENDOWMENT, and LOAN ASSOCIATION. Offices, 112 and 113, Cheapside, London.
H. G. WARD, Esq., M.P., Chairman.

LIVES ASSURED on every known system.
LOANS GRANTED repayable by instalments.
ANNUITIES immediate and deferred.
ENDOWMENTS for children payable at 14 or 21.

*** The remaining shares will continue on sale until the 25th December next.

Interest allowed on the paid-up Capital 5 per cent. per annum, payable half-yearly.

Applications for Shares and Prospectuses to be made to

FREDERIC LAWRANCE,
Resident Secretary.

Offices, 112 and 113, Cheapside.

News of the Week.

By the Overland Mail from India we have accounts from Bombay to the 27th August, and from China to the 21st June. The arrival of Sir H. Hardinge at the seat of his government, and the departure of Lord Ellenborough and Sir H. Pottinger for England, are the leading topics of the Indian news. In Scinde, the troops on the whole are healthy; the mutiny in the 64th Native Infantry has been repressed, the regiment has been disgraced by the loss of its colours, and the trial of the ringleaders is in progress. The detachment of troops sent into the territory of Shikarpoor has been compelled to return to camp, in consequence of their intense sufferings from loss of water and the heat of the climate. Affghanistan has been for some months tranquil, but an expedition was said to be preparing at Cabul against the Khan of Bokhara, under Akhbar Khan, who has also made arrangements for aiding the Sikhs in case of a conflict with the British Army. The news from China is not later than that by the last mail, and presents no topic of interest beyond the simple announcement that the new plenipotentiary, Mr. Davis, had been presented to Keing by Sir H. Pottinger, and had held a conversation with him without an interpreter, an event which was considered of great importance to our future intercourse with China.—From France we have accounts of the grand review which took place in Paris on Sunday in honour of the arrival of the Morocco trophies at the church of the Invalides. All the troops in garrison at Paris were under arms for the occasion, and were reviewed by the King in person, accompanied by Marshal Soult, the Duc de Nemours, and a brilliant suite. The Queen, the Princesses, and the Court were also present. The flags and other trophies captured at Isly and Mogadore were accepted by the King in the name of France, and were then deposited at the Invalides with the usual ceremonies. The Prince de Joinville has sent his flag-ship to Toulon, where great preparations had been made for his reception, and has proceeded by way of Havre to Paris in one of the steamers of his squadron. This unexpected event has given rise to numerous conjectures, some attributing his Royal Highness's movements to the natural desire of visiting the Princess at the Château d'Eu with as little delay as possible, and others asserting that he was displeased with the terms of the Morocco treaty, and unwilling to take any part in a festival which might indirectly be considered to do it honour.—The accounts from Spain are less warlike than they were last week, although the reconciliation which has taken place between the Esparterist and Progresista parties is still thought likely to produce a new insurrection.—From Germany we have the details of the enthusiastic reception given by the inhabitants of Berlin to the King and Queen of Prussia on their return to that capital. The warmth of feeling manifested by all classes of their subjects completely overpowered their Majesties, and the King was affected to tears by the loyalty of their welcome.—From the United States we learn that the Oregon question is again becoming a prominent feature of controversy; and that the President of Texas has called upon the United States to protect him in the contemplated war with Mexico.

At home, the Repeal agitation has assumed a sudden aspect of repose in consequence of the absence of Mr. O'Connell on a visit to his native mountains. The rumours which we noticed last week of a contemplated change of policy in Ireland have been confirmed by an important declaration of the Lord Lieutenant in reply to an Address from the Remonstrant Synod of Ulster. The Address expressed a hope that, under the blessing of Divine Providence, his Excellency might enjoy the delight of "beholding confidence superseding distrust, affection displacing alienation, and the chaos of religious and political strife settling into the organised forms of social harmony and national prosperity." In his reply, Lord Heytesbury said that the Synod might be assured that it his earnest desire "to administer existing laws with scrupulous impartiality, and with a full intention to recommend such conciliatory changes and improvements as may tend at once to secure the peace and prosperity of Ireland, and to confirm the power and integrity of the United Kingdom."—Her Majesty and Prince Albert returned to Windsor on Thursday in excellent health and spirits; and the King of the French is expected to embark at Treport on Monday next, and land at Portsmouth on the afternoon of the same day, or early on the following morning.—The German papers received last night contain the important announcement that a matrimonial union between the Grand Duchess Olga and Prince George of Cambridge has been definitively settled. The visit of the Emperor of Russia to England is said to have been connected with this alliance. The Prince Royal of Hanover having no issue, the Duke of Cambridge is, of course, heir presumptive to the Crown of Hanover.

Home News.

HER MAJESTY'S VISIT TO SCOTLAND.—Our report of the Royal progress during the last week brought the account down to Tuesday night. On Wednesday Her Majesty and the Prince again went up Glen Tilt. On Tuesday the dogs had been sent after the deer, and the result was that two of them, driven from the wood, took refuge in the water, and placing themselves against large rocks, were there kept at bay by the dogs, and kept the dogs at bay in return. The dogs kept swimming about for hours, afraid to venture too near, lest a dart from an antler should transfix them; and in that situation they remained till Wednesday forenoon, when the Royal party coming up, Prince Albert shot the two noble animals, in the presence of Her Majesty. The whole scene was a very exciting one. In the evening the Hon. James Murray, Lord Glenlyon's brother, with the Master of Strathallan, Mr. Drummond, of Megginch, and the officers on guard, had the honour of dining with Her Majesty. On Thursday the Prince and Lord Glenlyon started at 7 o'clock from the Castle, alone and unattended. The foresters had been out driving the deer towards the glen during the night, and every favourable opportunity of time and weather combined to insure an excellent day's sport for his Royal Highness. The Prince was again successful, and killed three superb bucks. After luncheon the Prince drove out Her Majesty in the pony phaeton, accompanied by Lord Glenlyon and Lord C. Wellesley. Her Majesty proceeded beyond Fascally, the seat of Mr. Butler, on the banks of the Garry. Her Majesty alighted at the entrance of the Pass of Killiecrankie, and having mounted her pony, which had been sent on before, rode down to the bottom of the Pass, and remained for some time admiring the beauty of the scene formed by the rushing of the Garry over the "Sodger's Loup," so called from one of Mackay's men having leaped over the chasm there, when pursued by Claverhouse's Highlanders. Her Majesty returned to the high road through the new path laid down by Mr. Butler, of Fascally, and entered the phaeton, which had been waiting for her, at the gate of the Pass. Her Majesty and the Prince arrived at the Castle at 7 o'clock. Lord and Lady Glenlyon, with the Hon. Miss Murray, had the honour of joining the Royal dinner party in the evening, which consisted of Her Majesty's suite, with the exception of Lord Aberdeen, who had gone to pay a brief visit to Lord Abercorn, at Laggan. Lord and Lady Glenlyon, during the stay of Her Majesty at the Castle, have occupied the cottage of Captain Macduff, his lordship's factor, who served with distinction in the American war. The stables belonging to this cottage unfortunately caught fire on Friday morning, and considerable damage was done before the flames could be subdued. In the course of the morning the Queen and Prince drove up Glen Tilt, but there was no deer-stalking. In the evening Her Majesty witnessed an exhibition of a similar nature to that which was represented the year before last at Taymouth. Shortly after dinner, Lord Glenlyon and several Highland officers executed their national dances before Her Majesty in the great drawing-room at the castle. The celebrated sword dance, called the Gillie Cullum, which Her Majesty so much admired at Taymouth, was executed with great spirit and precision by the Hon. Capt. Murray, of the Scots Fusilier Guards; and the Houlaghan, the Highland Fling, and the Moulin Dhu, were danced with all the national vigour and animation. Her Majesty expressed herself much delighted at the spectacle, and complimented Capt. Murray on the skill displayed by him in threading the labyrinth of claymores. In the course of the day Mr. Edwin Landseer arrived at Blair Athol, and was requested to send his portfolio for Her Majesty's inspection. On Saturday morning the rain fell in torrents. The extreme inclemency of the weather did not, however, deter Her Majesty from leaving the castle to witness an otter-hunt. Lord John Scott arrived at Fascally on the previous evening, and brought with him a fine young otter from Roxburghshire, as none could be found in the neighbourhood, although traces of them are to be seen in several places. Lord Aberdeen's hounds, with their keepers, were ordered round to the river Gavy, immediately behind the castle, and Her Majesty went to the banks of the river, mounted on her small gray pony, and wearing a mackintosh over her morning dress. Lord Glenlyon led the pony, and Capt. J. Murray, his Lordship's brother, held an umbrella over Her Majesty to keep off the rain, which continued without intermission. Prince Albert was on foot in a shooting jacket, and all the gentlemen of the suite were also attired in shooting jackets and caps. Lady Glenlyon, Lady Canning, the Hon. Miss Murray, and the other ladies of the suite were likewise present. The otter afforded some excellent sport, the hounds being under the direction of Lord Aberdeen. Her Majesty remained at the river side until the otter was killed. and then returned to the castle, having experienced no inconvenience from her exposure to the weather. After the return of the Royal party to the castle the rain ceased at intervals, and Prince Albert, accompanied by Lord Glenlyon, sallied forth to Ben Nevi, when his Royal Highness succeeded in killing two fine roes. Her Majesty drove out in the afternoon, which, despite the indications of the morning, turned out extremely beautiful. On Sunday Her Majesty, being displeased at the manner in which the people stared at her at church on the previous Sunday, requested that divine service might be performed in her private apartments. Her Majesty did not leave the castle grounds during the whole afternoon, and the numerous visitors who again thronged the church were disappointed. On Monday the Prince left the castle shortly after breakfast, with Lord Glenlyon, for deer-stalking in the glen near to the castle, and in the afternoon Her Majesty and the Prince took another drive in Glen Tilt. On Tuesday morning the Queen left Blair Athol, on her return to Windsor. Before leaving, Her Majesty planted two trees on the lawn before the gate of the castle, handling the mattock with no small agility. Prince Albert also planted two, further down the grounds, and the Princess Royal planted the same number, Lord Glenlyon assisting her to hold the spade, and press down the earth. After the planting, the Royal party returned to the castle, where they remained for a short time. Her Majesty and the Prince soon again made their appear-

mise at the gate, accompanied by Lord and Lady Glenlyon, and entering their carriage at half-past 9 o'clock, drove slowly off; but the Highland pipers striking up the Prince's salute, the carriage was, by order of Her Majesty, stopped till the salute was finished, when both bowing repeatedly to the Highlanders, who in imposing array lined one side of the road, they again drove off. Having crossed the bridge opposite the castle, they were received by a large assemblage of people who had been admitted into the grounds, and who, as the Queen passed on, respectfully uncovered—their courtesy being returned both by Her Majesty and the Prince. The carriage then drove more rapidly on, and the whole body of Highlanders burst into a shout of acclamation, which was reiterated and continued for some time after Her Majesty had disappeared, a Royal salute being also fired from an adjoining height. At the outer gate, also, a large company was in waiting, and received Her Majesty with every demonstration of loyalty. Lord Glenlyon rode alongside the Royal carriage, and two carriages followed; in one of which was the Princess Royal, with Lady Canning and Mademoiselle Charrier; and in another Lord Aberdeen, Lord C. Wellesley, and Sir E. Bowater. The other members of the suite had left in the morning. No event of any importance occurred until the cavalcade arrived at Dunkeld, when Her Majesty alighted and remained for a short period. The inhabitants had been anxious to erect a triumphal arch, but Lord Glenlyon intimated to them that any such display would be distasteful to Her Majesty, and the idea was abandoned. On arriving at Cupar Angus, the Royal cavalcade drove through three triumphal arches, which evinced considerable taste in their construction. The roadside was festooned, and the inhabitants had assembled in large numbers to greet the Queen as she passed once more amongst them. Two miles farther on towards Dundee, the Royal cavalcade was met by Lord Duncan, attired in the uniform of the Royal Archers. After a brief but courteous greeting from Her Majesty his lordship galloped on before Her Majesty's carriage, Lord Glenlyon and the Hon. Capt. Murray riding on either side of the carriage. One of the postilions contrived to break his stirrup-leather in going down the steep declivity near Camperdown Gate. Lord Duncan dismounted in an instant, and before Her Majesty was able to inquire into the nature of the accident his Lordship had buckled one of his stirrup-leathers to the postilion's saddle, and, resuming his station in front of the Royal carriage, galloped on to Dundee without any further hindrance. At Camperdown, his Lordship's son, attired in the Highland dress, was stationed at the roadside, and his salute was returned by a courteous greeting from Her Majesty as the Royal cavalcade passed rapidly by. The young descendant of the hero of Camperdown waving two flags, one of which, it was understood, was the flag which Crawford nailed to the mast of the Venerable, and the other that which De Winter lowered. Her Majesty arrived at Dundee at 3½, and was received by the local authorities, several of whom, including the Provost and magistrates, had gone forward to Lochee to meet the Royal cavalcade; but some accident happened to the vehicle which contained the Provost and his companions, and they were accordingly prevented from taking their part in the pageant. On arriving at the triumphal arch erected on the occasion of the Queen's landing, Her Majesty was loudly applauded by the people, who were ranged in dense masses on the platforms. Her Majesty alighted on the crimson carpet which had been spread along the quay to the floating-pier. This pier was also decked with a crimson covering, and red cloth was laid along the stairs which led to the place of embarkation. Her Majesty wore a black silk dress and black bonnet, with a shepherd's plaid thrown over her shoulders. The Prince was dressed in half mourning, as was also the Princess Royal, who accompanied her Royal parents as they walked through the crowds who thronged the quays in unrestrained disorder. At the top of the quay the Dean of Guild apologised to Her Majesty for the absence of the Provost, and the crowd began to press in upon Her Majesty in painful confusion. Her Majesty preserved her courage in the midst of this danger, which is said to have reflected much disgrace upon the authorities. The 60th Rifles, however, who formed the guard of honour at the Pierhead, seeing the insufficiency of the local police, who quietly permitted this disorderly scene to continue, came down towards the floating-pier, and kept the crowd at bay with their bayonets. With the crowd still pressing around her, however, Her Majesty once more took a cordial farewell of Lord Glenlyon, and called for the Hon. Capt. Murray, who came forward, and was warmly shaken by the hand by Her Majesty and the Prince. Captain Murray followed Her Majesty to Woolwich in the Fairy. Her Majesty having once more bid adieu to Lord Glenlyon and his brother, Prince Albert led the Princess Royal down to the pier, and Lord C. Wellesley and Sir E. Bowater handed Her Majesty to the barge, in which Lord Adolphus Fitzclarence was in waiting to receive her. The barge was then rowed off to the Royal yacht, which was smoking in the offing; and within half an hour the squadron got under weigh and steamed down the Firth of Tay. Notwithstanding the strong head-wind which prevailed during Tuesday night and the whole of Wednesday, the Royal yacht accomplished the voyage to Woolwich in 45 hours. On approaching the Thames, on Thursday morning, the Royal squadron was met by several river steamers crowded with company. On passing Sheerness, she was saluted by the Camperdown flag-ship; at the Medway and off Shellhaven, she lay to for the Black Eagle, which up to this point had been about a mile in the rear. Here the latter vessel took the lead, piloting the route of the Royal yacht to Woolwich. Several other steamers met the squadron in Gravesend Reach, and saluted Her Majesty, their respective crews cheering the Royal party, who had been on deck from an early hour. The squadron arrived off Gravesend soon after 12, and were received with a Royal salute from Tilbury Fort. Salutes were also fired from batteries stationed at the various pier-heads; and the progress of the Royal yacht was observed by many thousand spectators, who thronged every available point along the shore from whence a glimpse could be obtained. The run from Gravesend to Woolwich occupied about an hour and a half, the Royal yacht coming to her moorings off the Tower slips precisely at 10 minutes to 2. The Lords of the Admiralty were in attendance, and landed Her Majesty in their barge, amidst the usual salutes from the batteries, and loud cheers from the company assembled. Her Majesty and the suite immediately proceeded in the Royal carriages to the Paddington terminus of the Great Western Railway, and arrived at Windsor Castle at 4 o'clock, within 48 hours after leaving Dundee. We rejoice to add that both Her Majesty and the Prince appeared in excellent health and spirits.

The Royal Family and Court.—The Prince of Wales, Prince Alfred, and the Princess Alice, accompanied by the Dowager Lady Lyttelton, and attended by Lieut.-Col. the Hon. C. Grey, arrived at Windsor Castle on Wednesday from the Pavilion at Brighton. The Duchess of Kent returned to Frogmore on the same day from Witley Court, the residence of the Queen Dowager. The Duke of Cambridge and the Grand Duke of Mecklenburgh Strelitz arrived in Edinburgh on Monday on their way to Ethal House, the seat of Lord F. Fitzclarence. Their Royal Highnesses last week visited Taymouth Castle, the seat of the Marquis of Breadalbane, Inverary Castle, the seat of the Duke of Argyll, and Scone Palace, the seat of Lord Mansfield. Viscount Sydney has succeeded Viscount Hawarden as the Lord in Waiting on the Queen, the Hon. Nelson Hood has succeeded R. Ormsby Gore as the Groom in Waiting. Major-General Wemyss has succeeded Lord C. Wellesley as Equerry in Waiting on the Queen, and Lieut.-Col. Bouverie has succeeded Major-General Sir E. Bowater as Equerry in Waiting on Prince Albert.

Death of the Duke of Grafton.—We have to record the death of his Grace the Duke of Grafton, which took place on the 28th ult., at his seat, Euston Hall, Suffolk. The Noble Duke was in his 85th year, having been born in 1760. He married, in 1784, Lady C. M. Waldegrave, who died in 1808, and succeeded his father in 1811. His Grace had eleven children, six of whom are still alive. He is succeeded in his title and estates by his eldest son, the Earl of Euston, now Duke of Grafton, who was born in 1790.

Count Nesselrode arrived in town at a late hour on Monday night, accompanied by his son, Count Dmitry Nesselrode. The Count left Edinburgh on Sunday afternoon, travelling post to Newcastle, and thence by rail to London. During the few days which have elapsed since Count Nesselrode left Chatsworth, he has made an extended tour through the most beautiful districts of Scotland. The Count left town yesterday for Hamburgh, *en route* for St. Petersburgh. Count Dmitry Nesselrode will prolong his stay in this country until about the middle of the present month.

The Peerage.—The obstructions hitherto in the way of Colonel Tynte's claim to the Wharton Peerage, are understood to be so far removed, that it is expected he will be called to the Upper House by the title of Baron Wharton in a few months.

Foreign.

France.—Sunday being the day appointed for the ceremony of placing the Morocco trophies in the church of the Invalides, the occasion was celebrated by a grand review of the troops in garrison in Paris, and a military procession to the church where all the trophies taken by the French are now placed. A review of the military is a rarity in Paris, as there has not been one since 1839. On the 16th April in that year, when the last great review was held, some expressions of disapprobation of the political conduct of the Government were heard in the ranks of the National Guards, which not only caused alarm, but gave great offence to the Court. Since that period there has been no military display in Paris beyond the usual daily inspection of the troops in garrison. It would appear that the offence given by the National Guards has not been forgotten, for upon the present occasion they were excluded from all participation in the ceremonies of the day, the review and procession being confined to the regular troops in garrison in Paris and the neighbourhood. In order to give more *éclat* to the affair, the King reviewed the troops in person, and was accompanied by the Duke de Nemours, the Duke de Montpensier, and a brilliant staff. The Queen, Princesses, and Court were also present. The infantry were drawn up in the court of the Tuileries, and the cavalry and artillery on the Carrousel and the adjoining quays. The tent of the son of the Emperor of Morocco, taken at the battle of Isly, was erected for the occasion in the garden of the Tuileries. The King mounted his horse at one o'clock, and, having passed along the lines, placed himself in front of the Pavillon de l'Horloge, and distributed a number of decorations to officers, non-commissioned officers, and soldiers of each regiment as they filed by. Shortly afterwards the 28 decorated non-commissioned officers chosen to carry the flags and other trophies captured at the battle of Isly presented them to the King, who received them in the name of France, after which they were paraded before the lines of the troops. The Infantry next formed into marching order, 15 companies of grenadiers and voltigeurs occupying the centre of the column to serve as a guard of honour to the Moorish spoils, and moved in the direction of the Hotel des Invalides. The Artillery advanced after the Infantry and was followed by the Cavalry. On reaching the Esplanade, the column halted and divided into two bodies, between which the standard-bearers proceeded to the gate of the Invalides, where the trophies were received by the Governor and staff, and conveyed to the church, in which they are to be exposed to public view. The troops were then dismissed and returned to their respective quarters. His Majesty was enthusiastically received, and appeared to enjoy excellent health. Marshal Soult was also present at the review, having returned to Paris on Friday after a long absence in the country.—The Prince de Joinville has arrived unexpectedly at Havre, and was expected to proceed at once to the Château d'Eu, where the Princess is staying, having avoided Toulon, where a grand reception was prepared for him by the authorities. It was rumoured that his Royal Highness was displeased with the terms of the treaty with Morocco, and the Opposition papers continue to declare that the Prince, before the arrival of the Duke of Glucksberg, had made an arrangement with the Pacha of Larache, by which the Emperor of Morocco was to pay twelve million francs to France, in monthly instalments, as indemnity for the expenses of the war; with the stipulation that if Abd-el-Kader should be delivered up before the payment of the whole of the amount, the remainder should not be insisted upon. These conditions, says the *Siècle*, had actually been sent off to the Emperor, whose acceptance of them the Pacha considered himself in a position to guarantee, when the Duc de Glucksberg and M. de Nion, or rather Mr. Bulwer, substituted for them the treaty announced in Paris by the cannon of the Invalides. The King had written an autograph letter to the Prince de Joinville congratulating the officers and seamen of the fleet upon their recent victories, and the Prince had ordered it to be posted up on board all the vessels of the squadron. "The battle of Isly," says the *Algérié*, "was fought on the 14th, the bombardment of Mogador took place on the 15th, and it was in the night of the 14th, between those two victories, that Princess de Joinville was delivered of a daughter. Marshal Bugeaud, struck with this coincidence in the dates, asked the Prince, in the name of the army of Algeria, to add the name 'Victoria' to those already given to the new-born infant. The squadron has expressed the same wish. The King will, no doubt, consent to unite the recollection of the birth of his grand-daughter with the double *souvenir* of Isly and Mogador."—The preparations for the King's voyage to England are going on with great activity. The Elan steamer has arrived at Havre, from Cherbourg, where it is to take on board the cases containing crystal and Sevres china which the King is to present to Queen Victoria. The squadron is in readiness, and after a trial trip to Dieppe, with Admiral La Susse on board, has returned to Cherbourg. The King left Paris for Eu on Wednesday, and is expected to embark at Treport for Portsmouth on Monday next. M. Guizot has been seriously indisposed for the last week, but it is hoped that he will be well enough to undertake the journey to England.—Due notice is taken by the Opposition prints of the meeting held at Exeter-hall, on Wednesday week, by the friends of the London Missionary Society; but their comments upon the speeches which referred to the conduct of France towards the Queen of Tahiti do not present any features that would interest our readers.—The French Government is making great improvements in the Post-office. Since the first of last month letters of value or importance can be placed under the more immediate care of the Post-office functionaries, with the privilege of paying the postage before-hand or not as may be convenient. The towns on the line of the Rouen and Orleans railway have two, and in some places three, deliveries of letters a day. The *malle poste* goes from Paris to Geneva in 34 hours, and with all this, by a careful economy, the expenses have been reduced more than 320,000f. within the last six months, without impairing the efficiency of any department. In the interior arrangement of the General Post-office in Paris, some very salutary changes have also been made to insure regular attendance and despatch.—General Bustamente, the President of the Mexican republic before General Santa Anna, has arrived in Paris.—The French Government is about to erect a statue of Colbert at Rheims, his native city.

Spain.—We have accounts from Madrid to the 25th ult. It seems from the returns of the provincial elections that the Ministerial majority in the Cortes will be very considerable. It was calculated that the number of Opposition members in the Chamber of Deputies would not amount to more than six—three Carlists or Absolutists, and three Progresistas or Exaltados. The candidate who would probably be elected president was M. de Paula Castro-y-Orozco, the Minister of Justice in the Ofalia Administration, and the intimate friend of General Narvaez. The other candidates were Messrs. Isturitz and Burgos. Those for the Presidency of the Senate were the Marquis de Miraflores and Count de Fontana. The papers contradict the report of the young Queen's illness, which had found its way into the Paris journals. Her Majesty and her sister were seen riding out every day, and the inhabitants of Madrid could judge with their own eyes of the inaccuracy of the statement. It was reported that General Espartero intended to publish a manifesto to

the nation on the 10th of this month, the period at which he ceases to be the legal regent of the kingdom. The Marquis de Casa Irujo, Duke of Soto Mayor, has been appointed Envoy Extraordinary and Minister Plenipotentiary to the Court of London; and Don A. A. Galicino has been appointed Royal Commissioner of the Bank of San Fernando. The Madrid journals contain no news from the south of Spain, but letters from Gibraltar mention that Mr. Bulwer had not gone to Tangier merely to reinstate the Consul-General of Spain, but to negotiate for the abolition of the tribute hitherto paid by Sweden and Denmark to the Sovereign of Morocco. Admiral Owen gave a grand banquet in the Albion on the 16th, on the occasion of the conclusion of peace between France and Morocco, at which all the officers of the foreign ships of war lying at Gibraltar were invited.—Letters from Bayonne of the 25th state, that the reconciliation between the principal men of the Esparterist and Progresista parties was complete, and that there was every reason to fear that their united endeavours would ere long succeed in producing a new insurrection in Spain.—The French Minister at Lisbon, M. de Varennes, and M. Cueto, the Secretary of the Spanish Legation in the same capital, were robbed, during the night of the 15th, in the Seville diligence, between Valdepenas and Santa Cruz de Mudela. The coach was attacked by four armed men, who suffered it to proceed, after possessing themselves of a sum of 16,000 reals and some valuable jewels.

Germany.—Accounts from Berlin of the 25th ult. state that the return of the King of Prussia to his capital after a tour of two months, was celebrated on that day with great enthusiasm. The attempt upon the lives of the King and Queen by the assassin Tscheck was made, it will be remembered, on the 26th July, under the portal of the Palace, just as their Majesties were departing on a journey into Silesia and other parts of Germany. The King has since visited the whole of his central and eastern dominions, and has laid the first stone of the new building of the University of Konigsberg. His entire progress has been a kind of ovation of loyalty, for at every place at which he stopped addresses of congratulation were presented to him from the towns, and even villages lying in his course. His arrival in Berlin was welcomed with rejoicings of every description, and the different classes and professions presented addresses of congratulation. On arriving at the Palace His Majesty passed immediately through the open windows to the balcony of the drawing-room over the gateway which faces the Schloss-platz, and presented himself to the people. This was really a moving scene. The King, who was so affected that he could not avoid shedding tears, was greeted with the loud and enthusiastic cheering of from 10,000 to 12,000 people, who kept up for some minutes their hurrahs, and *labehocks* (long live the King), throwing up their hats and waving their hands. His Majesty then stepped back and assisted the Queen to the balcony, leading her with his hand to the front before the people. She was in tears and quite overcome with emotion, but curtsied gracefully to the multitude, and seemed deeply sensible of the affectionate welcome she was receiving. The King and Queen remained nearly ten minutes on the balcony, bowing repeatedly in acknowledgment of the continued cheering of the people, and amidst the chanting of the beautiful melody, "Sie leben hoch und lange jahr" (may you live many long long years). The King was dressed in a plain military uniform, with a single star, and looked remarkably well. In the evening the whole city was illuminated.

Switzerland.—A letter from Friburg speaks of a literary discovery connected with William Tell. The existence of this personage, which has hitherto appeared *quasi*-mythological, has, from this discovery, become an historical fact. A copy of Latin verses, written immediately after the battle of Morgarten, has just been found, in which his name is mentioned in precise terms. It is there stated that Tell was one of the three warriors who took the oath of Gruthli in the commencement of the 14th century. His name replaces that of Walter Furst, erroneously mentioned by the chroniclers of the time. As to the famous story of the apple and the arrow, nothing is said of it in the poem.—In Eastern Switzerland there appears to be a serious disposition to accomplish the projected railroad between the Lake of Constance and the foot of the Splugen, but that between Zurich and Basle seems to be entirely abandoned, on account of the impossibility of bringing the cantons through which it was to run to an understanding.

Italy.—The official papers of Naples of the 17th ult. announce that on the 5th the Duke de Montebello, the French Ambassador, having formally demanded the hand of the Princess of Salerno for the Duke d'Aumale, the father of the young Princess and the King had both signified their assent to the proposition. The King and Queen of Naples were then visiting the districts of Calabria which had been the seat of the late disturbances. It is said that there is no truth in the report that the King and Queen of Naples will visit Paris on the occasion, as the marriage is to take place at Naples in November; and that Austria will give Her Royal Highness a marriage portion of 200,000 florins, because her mother is the Emperor's sister.—Letters from Rome announce the death of Cardinal Silvestro Belli, at Jesi, on the 11th ult. He was born in 1781 at Anagni, where he pursued his studies, and, after fulfilling various offices for many years, was raised to the rank of Cardinal by the reigning Pontiff, in 1840; and in 1842 was made Bishop of Jesi.

Russia.—Accounts from St. Petersburgh speak of the continuance of the profound affliction of the Imperial family on account of the death of the Grand Duchess Alexandrina. The melancholy event made the deepest impression on the mind of the Emperor, who has since been suffering from determination of blood to the head. The Princess, not knowing that the Emperor, who had left her bedside, was still in the chamber, asked for her father's portrait, kissed it repeatedly, and requested the attendants to place it by her side in her coffin. The Emperor was so overcome by this last proof of the affection of his daughter, that he fainted. The Imperial family is now at Peterhoff, and it is doubtful whether the Emperor will go this autumn to the southern provinces of the empire, as he intended.—The Paris *Presse* mentions the publication of a recent ukase at St. Petersburgh, enacting that in future, when a synagogue or an Israelite school is to be erected in a street where a Greco-Russian Church exists, it must be separated from it by a distance of 100 khatters (200 yards). "Whilst this measure," adds the *Presse*, "was being adopted in St. Petersburgh, the Polish Government at Warsaw decreed the addition to the form of the oath required of Israelite recruits on their entering the army, of the following paragraph:—'I swear to be faithful to my colours and never to desert, even were the Messiah to descend upon earth.'"—The Holy Synod of St. Petersburgh had notified to the Catholic missionaries in Georgia to quit the empire, unless they choose to become naturalised Russians, and to cease in future all intercourse with the Holy See.

Turkey.—We learn by a letter from Constantinople of the 7th that the Sultan, with a view to encourage agriculture, has determined in council to send into each province a functionary to watch narrowly over the agricultural progress and wants of the inhabitants, and to communicate with the Government on the subject. A set of instructions, consisting of ten articles, has been drawn up to guide these officers in their duties, and to show the various populations what aid they have a right to expect from the Sultan's paternal care. The new officers are particularly enjoined to encourage the introduction of modern improvements, as far as they are compatible with the nature of the soil, and to favour the breed of Merino sheep.—Mr. Cartwright, Her Majesty's Consul-General at Constantinople, has received a highly flattering despatch from his Government, in reply to his request to be permitted to withdraw from the cares of public life. After enumerating his various and valuable services, he is requested to withhold his application for three months longer, when he will be entitled to the full retiring pay.—The Primates Wutsitsch and Petroniewitsch have arrived at Belgrade, where they were received with every demonstration of joy by the resident Servians, in which several Turkish Pachas joined. During the day of their arrival the church bells were set ringing, and salvos of artillery were fired, and at night bonfires were lighted on the heights of the city.

United States and Canada.—By the steam-ship Hibernia we have advices from Boston to the 16th ult. The news, notwithstanding it extends over 14 days, is comparatively barren of interest. There is no striking feature, and the details are more of local than of European interest. The Oregon question is again becoming a prominent feature of controversy, if we may judge of the space which it occupies in the newspapers. Texas, in her difficulties, is anxious to conciliate the good opinion of the American Union. Houston, the president, has called upon the President of the United States to protect him from the consequences of a war arising out of the contemplated conflict with Mexico. Baltimore had been the scene of extensive riots and conflagrations. Several of the belligerents were in custody, and the affair was undergoing prompt investigation. The intelligence from the Isthmus of Darien confirms the advices which had previously come to hand, that a survey had been completed by the French, and that the result of it was unfavourable to the junction of the two oceans. The health of General Jackson was sinking. The Indians in the Missouri are still active, and waging a fierce war against the United States. In a recent conflict a party of the Pawnees had eight killed, and the Sacs one killed.—It appears from a statement, entitled the "Epistle of the Twelve," that the Mormons intend to have no further election of a prophet, as head of their church, but that the succession to Joe Smith is given to a band of 12 men, whom they call apostles, and who are appointed to preach to the sect throughout Europe and America.—From Canada we learn that the Governor-General arrived at Montreal on the 3d ult., to swear in his new Ministers. The following constitute the Cabinet:—The Hon. W. H. Draper, Attorney-General for what was formerly Upper Canada; the Hon. W. Morris, Receiver-General; D. B. Papineau, Esq., Commissioner of Crown Lands; J. Smith, Esq., Queen's Counsel for that part of the province formerly Lower Canada, and Attorney-General for the same. The provincial Parliament had been further prorogued until the 22d October, and not then to meet for the despatch of business.

Brazils.—The Petrel packet arrived at Falmouth on Saturday with advices from Rio to the 25th July. For about ten days past, rumours to the effect that a Treaty had been concluded between this country and Brazil have been generally prevalent; and it was stated that the Petrel, which has been for some time due, was detained at Rio in order that she might bring the Treaty to England. The Petrel has now arrived, and it appears that she was detained for some political object not generally known; but she has brought neither a signed Treaty, nor any authentic particulars respecting a negotiation for one. Rumours are, indeed, still prevalent at Rio on this subject, but they are so vague as scarcely to deserve repetition.—St. Juan de Nicaragua, recently blockaded by the British, has been almost entirely destroyed by an earthquake.

India and China.—The Indian Mail to the 27th August has arrived this week. The news, though not of a striking nature, is of considerable interest. From Calcutta it relates principally to the new and late Governors-General. Sir H. Hardinge arrived there on the 23d July, and was immediately sworn into office. His first act was to continue Mr. Bird as Governor of Bengal, and on the next and subsequent days he held levees and durbars. Prior to his departure, Lord Ellenborough was entertained publicly by 200 officers of the army at Calcutta, and he then declared that his chief regret on quitting India arose from his separation from the military service, which he highly prized. He embarked on the 1st August on board the steamer Tenasserim, and immediately started for Suez. A testimonial had been subscribed to him worth 1500*l.*, from the whole community of India. The popularity of Sir H. Hardinge with the military is likely to be increased, as it had been rumoured in India, and as it was said on good authority, that he is empowered to raise new regiments, to add one captain to each of the actual corps, and to reintroduce the punishment of flogging into the native army. This last measure appears to be considered imperative by the officers, especially since the occurrence of the several mutinies which have disgraced the troops of Madras and Bengal. The mutiny of the 64th regiment of Bengal Infantry, which had been repressed by the decided measures of General Hunter, had produced the most stringent proceedings on the part of Sir C. Napier, the Governor of Scinde. The colours were taken from the regiment, and the trial of the 40 ringleaders of the mutiny was going on with the greatest care; it had commenced on the 22d July, at Sukkur, and a strong example would be made of those who should be proved guilty.—The news from the Punjab represents that country as a prey to anarchy and confusion, and the lowest intrigues of assassination and plunder by the chiefs. Heera Singh does not appear to be fixed in his power, and great commotions were expected to agitate the Sikhs in October next, at the time of the great Hindoo festival of the Dusserah, when all the native states are in the practice of making war against their enemies. Dost Mahommed, and his son, Akhbar Khan, have formed alliances (the latter a matrimonial one) with Yar Mahomet, the usurper of the sovereignty of Herat, while they are also said to be making arrangements with Heera Singh for aiding the Sikhs in case of a conflict with the British, with a large army, in the hope of conquering and plundering the north of India. These intrigues are well known, and are expected to influence the future policy of Sir Henry Hardinge. In Gwalior there were some intrigues respecting the command of the Jhinsee troops, who had mutinied against their chief, Bulwunt Rao, on account of his great oppressions. It was said that an uncle of the young Maharajah would obtain the command. The succession to the throne of Holkar, at Indore, has been settled by the elevation to it of a son of Bhow Holkar, who had married a daughter of Hurree Rao Holkar. The young Maharajah has assumed the name of Tookajee Holkar, and promises well. He is described as a manly boy, and has conciliated the good-will of the people. Considerable satisfaction was felt at Bombay in consequence of the mails from London having arrived there in 28 days and 16 hours, and it was expected that the voyage would be performed in much less time by powerful vessels when placed on that station. The arrival in Bombay of Sir H. Pottinger from China has been the signal of great rejoicings. He was welcomed with addresses, dinners, balls, &c. The Chamber of Commerce presented an address, to which his Excellency returned an answer, in which the late proceedings and negotiations in China are reviewed. Sir H. Pottinger embarked at Bombay on the 27th August, on his return to Europe, and arrived at Malta by this mail. The news from China is not later than the 21st June, the date received by the last mail. It was brought to Bombay by the steamer Driver, in which Sir H. Pottinger arrived there. Great dissatisfaction was expressed at the meddling of the French and Americans in the now settled affairs of China. It is mentioned that Sir H. Pottinger, prior to his departure, had introduced his successor, Mr. Davis, to Keying, when they conversed without the aid of an interpreter, which was considered a great advantage.

CITY.

Money Market, Friday. — Consols closed at 100¾ for Money, and 100⅞ for the Account; Exchequer Bills, 74 to 76 pm.; India Bonds, 94 to 96 pm.

GAZETTE OF THE WEEK—BANKRUPTS—C. K. Nicholls, Bridge-road, Battersea, banker—H. Haynes, Scholc, Norfolk, innkeeper—R. Robinson, Strand, coal merchant—E. Ashwell, Yeldon, Bedfordshire, butcher—M. Maslin, Croydon, coal merchant—J. T. Maund, Birmingham, lacemen—F. Depliness, Manchester, check manufacturer—R. J. Webb, Bath, wine merchant—R. Watson and R. Morris, Liverpool, brokers—L. D. Smith, H. Smith, and G. F. Smith, Dulverton, Somersetshire, and Gutter-lane, crape manufacturers—A. Tulley, Hackney, grocer—F. Howard, Tonbridge-place, Hoxton, publisher—J. Metcalf, Macclesfield, silk manufacturer—G. Croxton, Manchester, glass and china dealer—G. Alexander, Basminster, Dorsetshire, innkeeper.

SCOTCH SEQUESTRATIONS—J. and J. Vallance, Edinburgh, coal merchants—S. Fraser, Strathenmore, Ross-shire, grazier—A. Barker, Edinburgh, slater—D. Gill, Crossmill and Glasgow, calico printer—A. Rennie, Glasgow, grocer—D. Moir Devonside, Tillicoultry, woollen manufacturer.

Metropolis and its Vicinity.

Election of Lord Mayor.—Michaelmas Day this year falling on the Sunday, a Common Hall was held on Saturday morning, for the purpose of swearing in the new Sheriffs (Alderman Hunter and Alderman Sidney), and to elect a Lord Mayor for the year ensuing. After the usual forms had been gone through for swearing in the Sheriffs, the Common Sergeant read the names of the different Aldermen who had not passed the chair in the following rotation:—Alderman Thomas Wood,

citizen and framework-knitter (loud and long-continued cheering, mixed with some slight hisses). Alderman M. Gibbs, citizen and fishmonger (great cheering, which continued for some minutes; a small number in the hall, however hissed). The next name was that of Alderman Johnson, when nearly an equal number of hands were held up. The names of Sir George Carroll, Sir James Duke, Messrs. Hooper, Farncombe, and Musgrove, were then respectively put in nomination, but very few hands were held up for either of them. The Common Sergeant said the Sheriffs were of opinion that the election, on a show of hands, had fallen on Alderman Thomas Wood and Alderman Gibbs, whose names were accordingly returned to the Court of Aldermen, for their selection of one to fill the office. The Aldermen retired during the nomination. On the return of the Lord Mayor and Aldermen to the hustings, after about half-an-hour's absence, the Recorder came forward and announced that the election of Lord Mayor for the year ensuing had fallen on Alderman Gibbs. This announcement was followed by loud and long-continued cheers and hisses from one of the most crowded halls ever witnessed. Alderman Gibbs, Lord Mayor elect, shortly returned thanks, but the uproar and cheering was so great that scarcely a word could be heard by those on the hustings. He thanked the electors for the honour they had done him in appointing him Chief Magistrate of London.—Alderman T. Wood thanked the Livery for the almost unanimous manner that he had been returned to the Court of Aldermen; he should present himself again on the next occasion, and he had no doubt the spirit of persecution would by that time have ceased, and he should be returned Chief Magistrate. He did not complain of being neglected on the present occasion; but, although defeated, he would not shrink from contesting the office. He had performed his public duty impartially, and with integrity, and he had no doubt, some time or other, justice would be awarded to him.—It is understood that the votes of the aldermen were, for Alderman Wood, the Lord Mayor, Sir C. Marshall, Aldermen Humphery, Hooper, W. Hunter, and Alderman Wood himself. For Alderman Gibbs there were Sir C. Hunter, Sir P. Laurie, Sir J. Pirie, Sir G. Carroll, Aldermen Farebrother, Copeland, Kelly, Johnson, Farncombe, Challis, Musgrove and Gibbs.—The *Morning Chronicle* states that it is the intention of a numerous body of gentlemen connected with the City to present a memorial to Her Majesty, praying that the consent of the Crown may be withheld from the appointment of Alderman Gibbs. Transactions of a peculiar character on the part of the alderman with Mr. Beaumont, late M.P. for Northumberland (in connection with a man of the name of Hopkins), as also with Mr. Gardner, the wholesale stationer, of Newgate-street, together with his conduct in St. Stephen's, Walbrook, are alleged as sufficient grounds for the exercise of the Royal prerogative.

The New Sheriffs.—On Monday, at 11 A.M. the new sheriffs, Alderman Hunter and Alderman Sidney, met at the London Tavern the aldermen and members of the different city companies, with the late sheriffs, &c. where they partook of a *déjeûner*, preparatory to their going to Guildhall in procession. After the collation, the procession went to Guildhall, where the usual ceremony took place, and thence they proceeded to Blackfriars-bridge, where the party took water for the chambers of the Cursitor Baron, at which the new sheriffs were sworn into office, and the form of chopping sticks was gone through. The procession then returned to Blackfriars-bridge, where they disembarked, and proceeded to the London Tavern, where the sheriffs gave a banquet in honour of their inauguration. Alderman Hunter, the senior sheriff, presided, supported by his colleague, Ald. Sidney, the Lord Mayor, the Lord Mayor elect (Alderman Gibbs), the Chairman and Deputy-Chairman of the East India Company, Lord J. Russell, and Mr. Masterman, Members for the City, a large number of aldermen, and about 350 guests. After the usual loyal and routine toasts, the healths of the Lord Mayor and the Lord Mayor elect were drank, the former with considerable approbation, the latter with some manifestation of dislike from a portion of the company. In replying to the toasts of the "Members for the City of London," Lord J. Russell observed that the example of the city of London was looked up to by the whole country for freedom and commerce, and by following that example England surpassed every other nation in the world. The country at this moment enjoyed the inestimable blessings of peace; if it were a peace obtained by the dishonour of the English name, it would not be a blessing but a curse; but he was happy to say that it was one in which the honour and best interests of the nation had been consulted. In conclusion, he trusted that when the time should come for the Members for the City to relinquish their charge, they would be found by their constituents not unworthy of the honour that had been conferred on them.

Medical Profession Bill.—An aggregate public meeting, as it was termed in the notice, of the medical profession was held on Monday in one of the smaller rooms of Exeter-hall, to take into consideration the principle and details of Sir J. Graham's Medical Reform Bill, and to protest against it. There were about 120 persons in the body of the room, and Mr. Davies, of Hampstead, was called to the chair. Resolutions were passed, forming part of a protest against the Bill, in which the objections of the profession were stated at some length. After the resolutions had been carried, Mr. Wakley was loudly called for, and said that the profession must do something more than they had yet done. They must not only unite in denouncing the Government measure, but must be prepared with a measure of medical reform to substitute for it. How could they expect Government could frame a good measure on the subject, if those who were so much better able, by their education and pursuits, to do so hung back and neglected their duty? He had been asked why he had not himself introduced a Bill? His answer was, because he knew if he had it would have injured the profession. He should have had no chance of carrying it, and a vote of Parliament against a good Bill would be fatal to its after-success. He had heard of this Bill before it appeared. He had heard, too, that it was sanctioned by the College of Physicians of Edinburgh, by the Faculty of Medicine of Glasgow, and by the Colleges of Physicians and Surgeons of London, while the Apothecaries' Company and the head of the medical practitioners in this country had not been consulted upon it at all. He had, therefore, not pressed the Government with questions upon the subject, but had done all he could to delay its introduction to the end of the session, in order that they might have the opportunity of tearing it to pieces during the recess. They had no more chance of a good measure from the Whigs than the Tories, for Lord John Russell had told him that he approved of the Government Bill. So far as he was concerned, if only 20 Members would join with him, if he was but one of 20, he would tell them that Government should have more difficulty in passing this Bill than they had ever yet had in passing a measure. He would not offer a factious opposition to the Government, but the term factious could not be applied to a strenuous and firm opposition to such a measure as this; but whether or not, he would resist its enactment to the last. It was then resolved that this meeting authorise the appointment of deputations to the College of Physicians and Apothecaries'-hall, to ascertain their views on the measure.

Improvements in Piccadilly.—On Monday, by direction of the Commissioners of Woods and Forests, workmen were employed in the erection of a pillar upon the summit of the western portion of the gate at Hyde-park-corner, which is intended for the reception of an illuminated clock. The clock will have two dials, one facing Hyde-park, and the other fronting Grosvenor-place. The plan for widening the road has also been begun; but it is said that it will not be completed until the ensuing spring. The removal of Lady Gordon's house, and the garden which belonged to it, with the appropriation of a small portion of the Green-park, will occasion that section of Piccadilly to be of equal width, from the residence of the Duke of Grafton to the archway at Hyde-park-corner. A further improvement is in contemplation, by removing the remainder of the brick-wall between Albert-gate and Kensington, and substituting iron palisades. The parish of St. George, Hanover-square, agree to keep the roadway in repair, as far as the encroachment on the Green-park is concerned.

Embankment of the Thames.—The following is a copy of the letter from the Earl of Lincoln to the Lord Mayor, with the plan for the embankment of the river Thames between Battersea and Vauxhall Bridges:—"As chairman of the Commissioners appointed by Her Majesty 'for inquiring into and considering the most effectual means of improving the metropolis, and of providing increased facilities of communication within the same,' I have the honour to transmit to your Lordship herewith, for the information of the Corporation of London, as the body intrusted with the conservancy of the river Thames, a plan which it is their intention to recommend to the favourable consideration of Her Majesty, for the embankment of its northern shore between Battersea and Vauxhall Bridges; and I am to add, that it will be very satisfactory to the Commissioners to have the concurrence of the Conservators in a measure which we have framed as much in reference to the improvement of the navigation of the river, as to the many other advantages of which an embankment in that locality is obviously susceptible."

King's College Hospital.—The authorities of this institution are anxious to remove it from its present objectionable site to one that will be more appropriate. Some months since they made application to the Duchy of Lancaster, and the vacant space on the east side of Wellington-street, near Waterloo Bridge, was selected, but in consequence of a memorial from the inhabitants of Lancaster-place, opposite, representing the deterioration of property that would ensue from the erection of an hospital in that locality, the Chancellor of the Duchy refused his consent.

Wood Paving.—The Marylebone vestry have determined that the bottom of Oxford-street, which was first paved with wood, shall be repaved with granite. In this part the wood pavement has been completely worn out. It was laid down by contract at 2*s.* 2*d.* per yard for three years. The minute of vestry will require to be confirmed at the meeting which takes place this day.

Picture Lotteries.—The drawing of the prizes in Mrs. Parkes's Heptapræmion Lottery, and in Mr. Boys's Fine Art Distribution, took place on Monday; the former in Covent Garden Theatre, the latter in Freemason's Hall. The drawing in Mrs. Parkes's lottery commenced at 10, A.M., and continued till 8 in the evening; the 700 guinea prize, "The Battle of Langside," painted by Mr. C. Landseer, was won by Mr. Southgate of Fleet Street. The first of Mr. Boys's prizes of 500 guineas was won by Mr. Boys's agent in Wales. The subject of it is, "The Trial of King Charles the First in Westminster Hall, 1649," painted by Mr. Fisk. The second prize also fell to an agent of Mr. Boys, at Liverpool. It is likewise a painting by Mr. Fisk, "The Trial of Earl Strafford in Westminster Hall, 1641," and embraces more than 50 portraits.

Another Mysterious Case at Stepney.—On Monday an inquest was held at Stepney on the body of Mr. Samuel Cornish, belonging to the mail steam-ship Dee, on board of which he died on the 17th ult., and was buried at the Beaumont Cemetery at Stepney three days afterwards. The evidence of the medical witnesses proved that morphia and arsenic were found in his stomach on a *post mortem* examination. Other witnesses deposed that during his last illness he had been attended by a Mrs. Sutherland, who passed as his niece, and in whose favour he had made a will, but that deceased had repeatedly stated that she was no relation, and was frequently in the habit of drugging his food. A Mrs. Blackmore deposed that deceased had made complaints of this kind to witness and her husband; and about a week before his death had said, that should anything happen to him, and witness and her husband were not present, he should be treated unfairly. Witness replied if she was spared she would look after it. When witness heard of his death, she called upon Mrs. Sutherland, and asked her if she knew what Mr. Cornish had said about her drugging him? She said the world would talk. Witness then gave notice to the Coroner. The Coroner here said the case must be sifted to the bottom, and gave directions to the police to obtain the best evidence they could to unravel this mysterious occurrence. The case was then adjourned till Monday next for that purpose, and Mrs. Sutherland was taken into custody.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Sept. 28: West Districts, 135; Northern, 176; Central, 181; Eastern, 228; Southern, 212; Total, 932. Weekly average for the last five years, 946.

Provincial News.

Barnsley.—On Monday last Lord Wharncliffe delivered a speech in this town at a meeting of the supporters of the Society for Promoting the Increase of Church Accommodation in the Diocese of Ripon, which has attracted great attention, as it may be considered a declaration of the feelings of Government on the important subject to which it refers. The speech was a very long one, but the following extracts give some of its more interesting points. At the commencement Lord Wharncliffe said, "I am very anxious to address to the meeting a few words upon the present state of the questions with regard both to church accommodation and to the education of the poor; and also to take this opportunity of explaining what Government have done—what their objects are—as well as what the objects of Parliament have been in voting money for both these purposes—and finally to remind you how to obtain, and to instruct you how to make use of the sums so granted." On the subject of Church Extension his Lordship said, "I was myself at one time of opinion that the first thing to be done was to build churches; but now I incline to think that that was a mistake. The first duty, as it seems to me, is to appoint persons who will administer religious instruction to the people, allotting to each a suitable and convenient district; and I am satisfied that when that duty is properly performed by duly qualified and zealous men, there will be no want of the means for building churches in this country. I am persuaded that, upon suitable religious instruction being afforded by zealous and competent ministers to those classes of persons to whom it is important that such instruction should be given, they will not be satisfied with a mere room in which to worship God, but will find means of aiding the Government in providing a proper place for religious worship." In regard to education the Lord President said—"I now come to that of Education; and standing in the situation which I do, honoured by Her Majesty with the superintendence of that department—for a department it may now be called—to which the education, or rather the means which are supplied by Parliament for the education of the people is committed, I am anxious to say a few words upon that subject, and I very much wish that there were a greater number of persons present here, that a large number of the inhabitants of this district might hear what I have to say. I say this because undoubtedly there are great misapprehensions abroad upon the subject. There are misapprehensions in the first place as to the objects for which Parliament have voted the sum which is at the disposal of the Committee of Council for education. The misapprehensions are still greater perhaps with respect to the objects which the Committee of Council have in view, and the mode in which they will carry into effect the wishes and intentions of Parliament. You are all aware that up to a very late date nothing was contributed by Parliament towards the education of the people. It was left entirely to the efforts of individuals, and I am sorry to say that the result of that was, that the state of education in the greater part of England is lamentable in the extreme." After stating that the first grant made by Parliament was in 1836, and amounted to 20,000*l.*, and that the present grant is 40,000*l.* a year, his Lordship adverted to the appointment of inspectors, and said that to remove all jealousy on the part of the Church, the inspectors were subject to the approval of the Archbishops. "A notion has gone abroad among the clergy, I am sorry to say, that the object of the Committee of Council is to get possession of and to direct the whole education of the people. The clergy urge that they are the appointed ministers of the Church, whose duty it is to give religious instruction to the people, and that secular instruction, without religious instruction, is of no value; and that therefore the Church has a sort of right to conduct the universal education of the people of this country. Now, that would be true, perhaps, if all the persons in this country professed the established

religion; but, unfortunately, that is not the case. We all know how rife dissent is; moreover, we see yearly and monthly new sects arising, some of which more or less detach persons from the Church of England; and there can be no doubt that the whole body of Dissenters from the Church in England is a very considerable one. Now they all, undoubtedly, contribute towards these grants. Every man, whether Churchman or Dissenter, pays the taxes out of which this fund is to be provided; and, therefore, they are to be considered in this matter; and this being so, I don't think the clergy of the Church can set up a right to teach those persons who do not belong to the church of which they are ministers. It was therefore thought necessary in some degree to guard against that; and the result was, that Parliament, when it voted the money, stated that the grants should be made not only to schools in connection with the Establishment and the National School Society, but also to schools in connection with the British and Foreign School Society—a Society which differs, undoubtedly, from the National Society in several respects, and especially in this—that the National Society requires the Catechism to be taught in the schools connected with it; whereas the British and Foreign School Society, while it inculcates the necessity of reading and exercises in the Old and New Testaments, does not admit of a Catechism of any description." In regard to the clergy, his Lordship said, "A notion has gone abroad, especially among some of the clergy, that there is a disposition in the Committee of Council to assume to itself the whole of the direction of the education of the people, or so to interfere, at all events, as to indicate a disposition to separate the clergy from the people with respect to education. Now, I won't enter into the question of the right of the clergy, but this I am quite sure of—that if the people who profess the doctrines of the Established Church are to be taught, the clergy are the instruments through which the education must mainly be carried on. They are the parties with whom the bulk of the people are almost constantly in communication, they are always on the spot; they are in a station between the higher classes and the lower classes; they are themselves generally persons of education and talent; they have influence not only with the lower classes, but with the upper classes; and, whatever may be said of the voluntary zeal of country gentlemen or of tradesmen in the cause of education, I say that it is the business of the clergy to be zealous in that cause. I say that if education is to be carried on at all, it is absurd to think that you must not make the clergy the active means of carrying it on." The condition of schoolmasters was thus adverted to:—"You are aware that normal schools are institutions for the purpose of educating persons who are intended for the office of schoolmaster; an object most important in every point of view. Nothing is more deplorable than the state of education (speaking generally) of the schoolmasters who affect or pretend to teach the people. No system of education, no efforts for education, can be of much value until we shall have masters who shall be able to combine the improvement of the moral and religious knowledge of their pupils, as well as of their manners, with the general education they may impart. I wish I could say that the business of a schoolmaster could be truly called a profession. I wish that the middle and lower classes of the people in this country could see in the situation of the schoolmaster a situation to which they might hope to arrive, and which would not only afford them a decent livelihood, but raise them in the scale of society to a station which the important trust reposed in their hands seems to require. This must be done by degrees; and yet, perhaps, there is no object more important. What we shall be able to do, or what persons may expect us to do, I cannot say; but no person is more convinced than I am that upon the improvement of your schoolmaster does, in fact, depend the improvement of education. We have done something. By the last Order of Council upon the subject, we have agreed to do something towards building schoolmasters' houses. That is a great point. In order that a schoolmaster should be held in proper regard and respect, and that he should hold the rank and station which I have already stated I think it desirable that he should hold, I am of opinion that he ought to be provided with a suitable residence—a house by no means too large, so as to exalt him too much in the scale of society, but he should be taken out of a cottage and put into a decent residence, which would be calculated to make those persons of the class lower than himself inclined to show a proper feeling of respect for the schoolmaster who teaches their children. I need not, after what I have said, assure you that the great object I have at heart is, that in the performance of the duty I am called upon to perform, no act of mine shall give good ground for jealousy or ill feeling to any class or to any person, whether churchman or dissenter." His Lordship, in conclusion, expressed his belief that if the clergy would co-operate with the Government, the people of this country would in due time become the best educated people on the face of the earth.

Bingley.—During the autumn of 1833, Mr. Ferrand, M.P., introduced the allotment system into this parish, which has produced the most beneficial results. A field of 15 acres in extent, watered on two sides by the river Aire, the property of Mrs. Walker Ferrand, was provided by that lady for the purpose of testing the merits of the allotment system, on condition that she continued to receive the accustomed rent. It was divided into 59 allotments, the rent of each averaging about 11*s.*, which were distributed among 59 labouring men. The rent and taxes levied on the field amount to about 40*l.*, and cropping the same to about 60*l.*, making the sum total expended 100*l.*, whilst the crops produced amount in value, at a moderate calculation, to the sum of 500*l.* During the whole summer and autumn these 59 men and their families have been provided with wholesome vegetables, almost all of them are keeping one or two pigs, whilst there still remains growing on nearly every allotment the winter crop of Potatoes. The cultivation of these field gardens has employed hundreds of their leisure hours, which would otherwise have been passed in the beer-shops; and their wives and families may be seen almost daily assisting in the cultivation, or enjoying the beautiful walk on the banks of the Aire. Mrs. W. Ferrand has promised to add on the 1st of January between 50 and 60 acres to the present allotments, and this land is already bespoken by the operatives and tradesmen of the town. A cricket club has also been lately formed, and numbers among its members every class of society in the parish. To celebrate the commencement of the allotment system in this neighbourhood, as well as the revival of the manly game of cricket, the owners of the allotments, the members of the cricket club, as well as the friends and supporters of both, have determined to dine together on the 11th of this month. Lord John Manners, who has promised to attend the dinner, will be invited to preside, and it is expected that Mr. D'Israeli, Mr. Walter, late M.P. for Nottingham, and other gentlemen will join the party.

Gloucester.—The Musical Festival closed on Friday with the *Messiah*. The collections at the Cathedral doors after each performance, which are appropriated entirely to the Clerical and Orphan Funds, were as follow:—Tuesday, 163*l.* 18*s.* 4*d.*; Wednesday, 111*l.* 9*s.* 4*d.*; Thursday, 79*l.* 19*s.*; Friday, 175*l.* 0*s.* 4*d.* Total, 530*l.* 7*s.* This amount does not include the donations, so that, compared with the returns of 1841, there is a deficiency of 8*l.*, but including the sums that are given, the charity will have gained. The attendance generally was good. The nobility and gentry of the county took little interest in it, and but for the exertions of the inhabitants of the city the present Festival would not have taken place.

Gravesend.—On Monday there was a full meeting of the Commissioners of Pavements of this town, to take into consideration the propriety of making an application to the Home-office to remove from the commission of the peace Messrs. Cruden, Smith, and Troughton, on the ground that they are notoriously in the habit of desecrating the Sabbath, by employing touters in the Star Packet-office (being themselves directors of the Star Company) on the Sundays, during divine service. After some animated discussion, a committee was appointed, with but little opposition, to draw up a memorial to Sir J. Graham for the removal of the parties in question from the commission of the peace.

Liverpool.—On Friday last the Mayor of this city gave a public dinner to Sir Robert and Lady Sale, who had arrived a few days before from Londonderry. About 72 persons were invited to meet them. After the usual routine toasts, the health of Sir Robert and Lady Sale was drank separately, and most cordially received.

Maidstone.—Last week, the Archbishop of Canterbury held his triennial visitation at All Saints' Church in this town. There were present A. B. Hope, Esq., M.P., Archdeacon Lyall, and upwards of 100 clergymen, and great anxiety was evinced as to the views which his Grace was likely to take upon matters of great and stirring interest, which have of late agitated, and in some measure divided the Church. His Grace commenced by adverting to the efforts made for the extension of education among the mass of the people and for the building of new churches, deducing from the facts he quoted, the conclusion that the clergy and the laity have formed a permanent union for the spread of religion and the benefit of society. His Grace expressed his humble gratitude to that gracious Providence which has already lengthened his days beyond the ordinary term of human existence, that he might behold what he trusted was but the commencement of brighter prospects to come. "I look forward," he said, "with hope, though I am not altogether free from anxiety, to the future destinies of our Church. It is not from direct violence from without, or from dissension from within, that I apprehend immediate danger, but what may eventually be the result of her external dissensions, and the differences now existing within her own bosom, if they should ever proceed to extreme lengths, it is painful to contemplate. 'If ye bite and devour one another, take heed that ye are not consumed one of another,' was the warning of the Apostle to the Galatians. I am far from asserting that that language is applicable in all its significancy to the state of our own Church, but I fear there is enough of division to weaken those resources which, if applied in conjunction, might much more effectually aid the common object of promoting the glory of God and the happiness of our fellow-countrymen, than they can be promoted whilst that division is to be found which, unfortunately, it is notorious does exist amongst us. By these indications of discord, the hopes of the Romanists have been raised—without any sufficient ground I fully believe. From the extent of resources at their command, and from the unity of purpose which marks their proceedings, they have succeeded in making an impression in our colonies; but, notwithstanding the gigantic resources which they possess, their success in this country will probably be limited to a few converts. At the time of our separation from Rome it was satisfactorily shown that we could not partake of her communion without partaking of her sins; and as no material alteration has taken place in her system, and as her doctrines are unchanged, and, in her own estimation, are unchangeable, it may be presumed that few persons who have considered the grounds on which our reformers were justified, will be disposed to return to her communion. Among the Dissenters, within the last few years, so far as I can judge from some of their writers, and the expressions employed at their meetings, a feeling of dislike to the Church appears to be gaining ground. After reasonable allowance is made for temporary excitement I see enough to convince me that serious designs are in agitation for the subversion of our national Church. Under the circumstances alluded to above, I see no reason for alarm, but much to regret in the partial estrangement of the people from the Church, as well as in the defeat of measures by them useful to society; the successful opposition, for example, made to the plan proposed by the Government for the education of children employed in the mining and manufacturing districts affords a melancholy proof of this. The principles of dissent indeed appear to me to be essentially faulty, as they open an inlet to errors of every description, and act directly in opposition to that spirit of unity which Christ acted upon when he founded the Church. In this latter principle of unity the strength of the Church consists. While she has unity in herself there is little to dread from external violence, but she may suffer irremediably from divisions within herself. What is wanted at present to insure her efficiency is peace. In speaking of peace I am far from recommending the compromise of principle with indifference, or the sacrifice of the truth—that peace which alone can be lasting and useful is to be found in the Church, and in the determination of her ministers to act cordially together in the discharge of the duties assigned to them, abstaining from unprofitable controversies, or from an indulgence in rancour, through slight differences (for differences must needs exist), but discussing them with temper, and with no other desire than that of elucidating the truth. In speaking thus of the Church, I do not deny the existence of piety or the hope of salvation out of its pale; but, as all revelation proceeds from our blessed Lord, I can hardly be wrong in the belief, that he who brought down the word to the Church from on high has also provided the means of transmitting it to all generations." The most Rev. Primate then proceeded to detail at great length the operations of the Incorporated Society for the Propagation of the Gospel in Foreign Parts, and strongly recommended the formation of auxiliary branches in its aid throughout the diocese. His Grace then proceeded to remark on the especial duties of the clergy towards their flocks and towards one another. "In the performance of these duties it is evident that gentleness, firmness, and coolness, are essentially required, and that your success in most instances will be in proportion as you act on that principle. Consideration to men of low estate should be visible in all the proceedings of the parochial minister. The poor are easily won by kindness, and to a certain degree repulsed by austerity; they have many wants and many hardships, and much may be done by the clergyman for their relief and consolation. His advice, exhortation, and even reproof, will be received with attention, when the people are convinced that they can trust in his judgment and his disposition to promote their welfare; but allowance must always be made for their errors and their prejudices. The conversation with them at their homes, and the service at the church should be suited to their capacity. Discourses on abstruse points of theology can never be useful to ordinary congregations, but may have the effect of unsettling their minds, and occasioning misinterpretation and error." His Grace proceeded again to recommend, in the case of differences arising among the clergy on points of discipline, that care should be taken to speak at all times dispassionately and with moderation. By Christian gentleness and prudence they would best promote the efficiency of the Church, whilst they could not be certain of the consequences of discussion in public assemblies upon such matters. Again enforcing the necessity of unity amongst ourselves, his Grace concluded in the following words:—"Our Church would then approach as nearly as is consistent with human infirmity that blessed condition which shall be attained hereafter, when as an integral part of the Church Universal, she shall be presented to 'the Father of Love without spot or blemish. Return all separatists to her bosom, and the restoration of union among all the Christian Churches may seem impossible, humanly speaking; but shall we limit the Divine omnipotence?—shall we say that He who brought light from darkness, and who has so long protected His church against the malice of men, is unable to tranquillise the passions, and still the commotions which impede the efficiency of the Church and obscure her glory? It is for us to set a bright example by merging all strife and dissension amongst ourselves in such an entire devotion to our duties as to produce a hearty concurrence in doing the work of the Lord, and to leave no avenue open for the entrance of contention and discord."

Oxford.—The present Vice-Chancellor having nearly completed the usual term for holding that office, another head of a house will be nominated before the commencement of term on the 10th inst. On that occasion the letters of nomination will be read in Convocation by the senior proctor, and then submitted to the approbation of the house. If the nomination be approved, the new Vice-Chancellor will be immediately sworn and admitted into office. The next in rotation for the office is Dr. Symons, Warden of Wadham College, and he being one of the six doctors whose report of Dr. Pusey's sermon led to the sentence which prohibited him from preaching within the precincts of the University for two years, those members of the University who disapprove of that

sentence will oppose the appointment of Dr. Symons. For this purpose a circular has been issued, requesting their attendance in Oxford on the 8th inst.

Portsmouth.—A public meeting of the inhabitants of Portsmouth was held on Thursday for the purpose of adopting measures to give a suitable reception to the King of the French on his visit to this country. The Mayor presided, and stated that the inhabitants would not allow so favourable an opportunity to pass of expressing to His Majesty on his landing at their port the high estimation in which he was held by the people of England. On the occasion of Her Majesty's visit to France last year, every hospitality was shown by the French to all who accompanied Her Majesty, whether in a civil or military capacity, and he hoped that they would not be outdone even in courtesy and hospitality by their brave neighbours, but would show the same attention to His Majesty's suite and to the officers of his squadron. Several gentlemen addressed the meeting, and eulogised his Majesty for his anxious desire to preserve the good understanding between France and England, and to encourage and promote feelings of kindness and friendship between the two countries. It was resolved to invite the officers of the French squadron to a public dinner during their stay at Portsmouth, and a committee was formed to make arrangements. The officers of Her Majesty's ships at this port are also getting up an entertainment, to which they purpose inviting the officers of the French squadron. This is to be a ball and supper, and it promises to be a very brilliant affair. It is confined to naval officers at present in commission, of which there are a considerable number now in port, each of whom will be allowed a given number of tickets for distribution. During the time the French squadron remains here, Portsmouth will be a continued scene of gaiety. The officers of the regiments doing garrison duty also intend to invite the French officers, and other entertainments are spoken of.—The experimental squadron will shortly sail on their first cruise. Seven of them are at Spithead, and the greatest interest has been excited in naval circles to ascertain their respective qualities.

Sunderland.—An inquiry was instituted before the magistrates, at Belford, on Tuesday last, respecting the burning of the property belonging to James Cockburn Belaney, and the breaches of the peace committed at North Sunderland, as stated in our last. Belaney, accompanied by his brother, the Rev. Mr. Belaney, and his solicitor, were present during the inquiry, and it is understood that steps have been taken to sue the hundred for the amount of damage. The house destroyed is not the romantic cottage on the edge of the cliff, but a farmhouse where he had been residing, and which belonged to the trustees of the late Lord Crewe, and it is said to be insured. Belaney's new house is known by the name of the Cave, and it has been built so close to the sea that the spray will, in a storm, blow against the windows. It is described by the *Newcastle Journal* as a curious place. The soil has been cut away from the top of the rock on which it is built, and so far had this to be done, that the roof of the house is nearly level with the ground of the land side. It is surrounded by a high wall, so that no one can obtain entrance to it but by descending a flight of about twenty-one steps, and then the door, instead of swinging on hinges, is made, like a portcullis, to draw up into the wall. The sea view is, of course, extensive, and the situation would seem not a disagreeable one in summer, but during winter it must be exceedingly cold and dreary. What trifling furniture was saved from the fire was on Monday conveyed in a cart to Aytoun, about ten miles north of Berwick-upon-Tweed, where Belaney's father resides. So universal would seem to be the feeling excited against him, that it is stated that his London solicitor, having been recognised the other day at Doncaster races, was attacked by the mob, and ducked in a pond.—On Saturday afternoon an explosion, attended with a dreadful loss of life, took place at Haswell colliery, about ten miles distant from this place. It happened at a time when there were about 100 men and boys in the pit, and no less than 95 have lost their lives. Haswell colliery is situate in the centre of the great Durham coal-field, about seven miles from Durham, and nine from Sunderland. It is the property of Messrs. Clark, Taylor, Plumer, and other wealthy coal-owners connected with the district. It is 150 fathoms deep, and the workings are in the well-known Hutton seam. The character of the mine in respect to ventilation has always stood high. During the pitmen's strike a few of the off-hand men were employed as hewers, and a few new men introduced; but since the termination of the strike, none but experienced workmen have been employed underground, the others being employed at bank. It is unnecessary to enter into the heartrending details of individual suffering caused by this calamity. The reader must be left to his own imagination. Not a soul has been left to tell the mournful tale how the accident occurred, the whole of the men employed in the working having been swept into eternity without a moment's warning. Four men who were at the bottom of the shaft escaped, by the fire having knocked itself out before it reached them. An inquest has been held and several witnesses examined at great length, but after numerous sittings, it was agreed to have the pit surveyed, and to adjourn the inquest until the surveyors have made their report.

Southampton.—Upwards of 370 passengers embarked from Southampton on Thursday, for the East and West Indies and the Mediterranean; these, and their friends who accompanied them to take leave, may be computed at 1000 persons who have visited that town within the last two or three days. On Tuesday night every hotel was crowded, and in many of them beds were obliged to be made up on the floors.

Windsor and Eton.—The water which supplies the dog-kennel of the Castle has been analysed by Mr. Phillips, and Dr. Ryan, in consequence of the frequent deaths supposed to have been occasioned by the presence of lead from the pipes. From the results of their experiments it has been calculated that 1312 grains of carbonate of lead were taken up by every imperial gallon of water (in its passage through the pipes) used at the kennel. There are now in the Royal pack 12 couples of young hounds which have never tasted one drop of the water which has passed through the old leaden pipes, and they will be hunted during the approaching season.—A new regulation respecting the admission of pupils to Eton College, and which has been long contemplated, has now been determined upon, a notice having just been issued by the Rev. Dr. Hawtrey, the Head Master, that after Easter next he will not admit any boy to the school who shall have completed his 14th year. During the past week the scholars have again assembled. Since the vacation, when the pupils amounted to 751, sixty additional boys have been entered on the school list. There has been a gradual yearly increase in the number of the school during the past ten years. In 1835 the number was only 446.

Yarmouth.—A melancholy shipwreck occurred on Sunday afternoon off this port, about ten miles distant from the coast. A large foreign schooner, with a white ball painted on her bows, was suddenly seen to capsize in a gale of wind, and disappear about a mile outside the Cross-sands. She had signals of distress flying, and was apparently running for the land when the catastrophe happened, and it is feared that every soul on board was drowned. There were several colliers passing through the roads at the time, and the masters bore down to the spot where the vessel was seen to founder, in the hope of picking up some of the crew, but none were seen.

York.—The meetings of the British Association during the week have gone off with their usual spirit, and many papers of great interest have been read. The Report of the Council, which was read by Col. Sabine, one of the general secretaries, was a summary of the proceedings intrusted to the Council in London, showing the progress made in carrying out the views of the Association since the meeting at Cork. A resolution had been there passed that application should be made on the part of the Association to the Master of the Ordnance, entreating his assistance in the proposed experiments of captive balloons. The reply from the Master-General stated that the commandant of the garrison at Woolwich has been directed to afford the facilities and assistance requested. The object of the investigation is to obtain records of the states of the atmosphere at different heights. Another resolution passed by the General Committee at Cork, was that application be made to Government for the insertion of contour lines of elevation on the ordnance maps of Ireland, such lines representing the various degrees of elevation of the surface of the country from actual surveys, being of great value for engineering, mining, geological, and mechanical purposes. These lines, also, would be serviceable as guides for drainage, or irrigation, &c. The probable cost of the operations by which the data for contouring the whole of the maps will be supplied had been estimated at 10,000*l.* No direct reply had been received to the application, but the Council had learnt from other sources that the contour lines are to be inserted in the ordnance maps. Another application to be made to Government was for its aid to publish the researches of Professor Forbes in the Ægean Sea. During this survey of the submarine zoology of the Ægean, and in the examination of the coasts and interior country, Professor Forbes observed upwards of 150 species of animals, which he regards as altogether new to science, and a much larger number which have been previously unknown in these localities. He also observed that several distinct zones of depth are naturally defined in the Ægean Sea by distinct and peculiar groups of plants and animals; that the lower we pass downwards in this sea the more do the organic forms resemble species which occur near the surface of the ocean in arctic regions; and that some species of mollusca have been dredged alive in the Ægean, of which the remains only had been previously known in a fossil state, and were thought to be extinct. These and other conclusions derived by Professor Forbes from his researches, have an important bearing on the philosophy of natural history, and on the establishment of general truths in geology. The cost of the publication will be about 500*l.*; and Sir R. Peel has consented to Mr. Forbes's work, which will contain about 300 pages and 100 plates, being published at the expense of Government, provided that copies of it should be sold at a price considerably less than that of their cost. The Council further reported that the general treasurer had received 1000*l.*, granted by Government for the publication of the catal gue of stars in the "Histoire Celeste" of Lalande, and of Lacaille's catalogue of stars in the southern hemisphere. Also that the railway geological sections, &c., which have been made at the expense of the British Association, at a cost of 363*l.* 6*s.* 9*d.*, have been deposited in the Museum of Economic Geology, and that the sections are to be continued at the expense of Government. The Council had requested the following reports to be drawn up, which were submitted to the meeting at York, viz., On the Performance of the Self-Registering Meteorogical Apparatus, and of the Electrical Apparatus of the Observatory at Kew belonging to the Association; also an Account of the Improvements which Lord Rosse has effected in the Construction of Reflecting Telescopes. Invitations for the meeting of the Association in 1845 had been received from Bath, Cambridge, and Southampton, and it was resolved unanimously that the invitation from Cambridge be accepted. At the last meeting of the General Committee, Professor Philips, the Assistant-general Secretary, read a list of awards, which had met the approbation of the Committee of Recommendations, and which were unanimously agreed to by the meeting:—In Section A, mathematics and physics, the total amount of grants was 906*l.* 11*s.* 5*d.*; in Section B, chemistry and mineralogy, 145*l.*; in Section C, geology and geography, 50*l.*; in Section D, zoology and botany, 105*l.*; in Section E, medical science, 20*l.*; and in Section F, statistics, 40*l.* For Section G, mechanical science, no grants were requested. Mr. J. Taylor, the Treasurer, next read his accounts for the present meeting. Altogether there had been 917 tickets disposed of. The number of old life members attending was 266; old annual members, 47, from whom 57*l.* had been received; new life members, 159, from whom 695*l.* was received; new annual subscribers, 196, the sum received being 392*l.*; ladies' tickets, 257; sectional tickets, 9. There had also been received from the sale of books, 92*l.* 2*s.*; and additionally sold since the last day, 56*l.* 2*s.*; making the total receipts, 1558*l.* 4*s.* A report was next read from the Committee of Recommendations for reports not involving grants of money. Amongst these it was recommended that the name of Lieut. Stratford should be added to the Committee for the Reduction of the Stars; that Sir D. Brewster should continue his observations on the spectrum; and that the report delivered in by Colonel Sabine, of the meteorological observations made at Toronto should be published entire in the proceedings of the Association. A recommendation was made from the Natural History section that scientific periodicals should be transmitted at a low rate of postage. It was also resolved that a deputation, consisting of the President of the British Association and the Presidents of the Royal and Geological Societies, should wait upon the President of the Royal Asiatic Society to request their interference with the Government for further investigations on the geology of the Seivalik hills. It had been resolved that the meteorological observations made at different stations at the expense of the Association should be discontinued, and that the instruments should be deposited in the Observatory at Kew. The Council was requested to invite the attendance of M. Humboldt and other philophers at the great Magnetic Congress which it is intended to hold next year at Cambridge.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 3005*l.*; Bristol and Gloucester, 1266*l.*; Eastern Counties, 4431*l.*; Edinburgh and Glasgow, 2472*l.*; Great Western, 17,814*l.*; Grand Junction, 8652*l.*; Glasgow, Paisley, and Ayr, 1518*l.*; Great North of England, 2017*l.*; London and Birmingham, 18,546*l.*; South Western, 7281*l.*; Blackwall, 1072*l.*; Greenwich, 674*l.*; Brighton, 5619*l.*; Croydon, 506*l.*; Liverpool and Manchester, 5553*l.*; Manchester, Leeds, and Hull, associated, 8348*l.*; Midland, 12,410*l.*; Manchester and Birmingham, 3308*l.*; Newcastle and Carlisle, 1740*l.*; Newcastle and Darlington, 1203*l.*; Preston and Wyre, 518*l.*; South-Eastern and Dover, 6459*l.*; Sheffield and Manchester, 874*l.*; York and North Midland, with Leeds and Selby, 2947*l.*; Yarmouth and Norwich, 340*l.*—On Monday the reduction of passenger conveyance by third class trains to 1*d.* per head per mile took place between Birmingham and Liverpool and Birmingham and London. Crowds of persons in the morning thronged the gates of the terminus in Birmingham to take places by the train for Liverpool; and long before half-past two in the afternoon, when it was announced the 1*d.* per mile train was to start for London, some hundreds of persons had assembled. Although the rain fell heavily 10 carriages, laden with about 400 passengers, started from the Birmingham terminus for the metropolis, and at Roade and Wolverton it was found necessary to attach other carriages, the whole number brought to the Euston-square end of the line amounting to 12, exclusive of luggage vans. The other great northern lines, including the Grand Junction, and York and North Midland, have also agreed to make a large reduction in their fares.—Friday was the 19th anniversary of the opening of the Stockton and Darlington Railway, which is the oldest of the existing railways, and the first on which locomotive engines were employed for the conveyance of passengers and goods.—The provisional committee of the proposed "Direct Northern Railway" have issued a prospectus complaining of certain "encroachments" which they allege have been made upon their line by the projectors of the "London and York line direct," which amount, they say, to an attempt to appropriate upwards of 70 miles from London of their published line, besides their London terminus at King's-cross. They say that they communicated their sense of these encroachments to the York and London Company by circular, addressed to each member of the committee, on the 18th of May last, and that the map of the London and York Railway, containing the encroachments, was not published until the latter part of August. The distance by the London and York line is stated at 200 miles, and by the Direct Northern at 180 miles, but these facts and the statements which acccompany them are positively contradicted by the other Company.—The Brighton, Lewes, and Hastings Company have resolved to give the Brighton Company, on condition of taking 3500 shares, the option of leasing the line within three calendar months of its completion at a rent of 4½

per cent. upon the cost of the works.—The Sheffield and Rotherham Railway it is stated will, from and after the 10th October next, be worked under the control of the Midland Company. The basis of the arrangement is a perpetual annuity at the rate of six per cent. per annum to be paid by the latter company.—The Sheffield, Ashton, and Manchester Company is working successfully, and the whole line will be shortly opened. Arrangements it appears have been made with Lord F. Egerton and the Manchester and Birmingham Company for the formation of the South Junction through Manchester to connect themselves with the Liverpool and Manchester and the river and canal navigations. Other measures for improving the traffic of the line in connection with the Sheffield, Lincolnshire, and Midland Railways, are also in progress, and the shareholders have given the directors full powers to carry them out.—The Liverpool papers state that one day last week no fewer than 8000 persons passed from Leeds and York to Hull in three excursion trains! Not a single accident of any kind occurred.

IRELAND.

Dublin.—Lady Heytesbury, the lady of the Lord Lieutenant, was seized with a severe attack of gastric fever last week, which assumed so alarming a character that no hopes were entertained of her recovery, and prayers were offered up for her on Sunday at the Castle chapel. We regret to say that her Excellency is still in a precarious state.—It is stated that the Deanery of Killala, vacant by the death of the Hon. G. Gore, is to be conferred upon the Rev. F. F. Trench, perpetual curate of Cloughgordon, in the county of Tipperary. This is the first benefice of a superior class in the gift of the Crown which has become vacant since the appointment of Lord Heytesbury, and considerable interest has been manifested respecting the selection of the new Dean. Mr. Trench has been a supporter of the national system, and has vindicated his opinions on the subject in a published correspondence with his relative, the Earl of Clancarty, whose hostility to the National Board he had endeavoured to remove.—The Land Commission were engaged last week in prosecuting their inquiries in Tipperary. Their inquiries, it is understood, were very particular, and directed principally to the causes of the agrarian outrages which have disgraced the county.—The projected railway from Derry to Coleraine involves the reclamation from the sea of waste land, whose estimated value is 800,000*l.*, which will be double the estimated expense. So great is the demand for Irish railway shares, that 10,000 more than could be given were solicited for the Belfast and Ballimena line.—The weekly meeting of the Repeal Association took place on Monday in Conciliation-hall, Alderman Keshan in the chair. Several remittances were announced, including some from the West Indies, Manchester, Liverpool, and Edinburgh. On the motion of the Hon. Mr. Hutchinson, two resolutions were adopted, one recommending the weekly collection of the Repeal rent, and the other, that correspondents through whom the money came should be instructed to mention the amount sent from their localities for the preceding six months. The hon. gentleman said that the plan proposed would have the effect of stimulating the country to increased exertion in the collection of the Repeal rent. It was well known that the largest contributors to the national fund were a class of persons, comparatively speaking, in the greatest distress, and this fact ought to prove to the Government that the men who made these sacrifices were in earnest. Yes; the people of Ireland were determined to carry out by legal and peaceable means the object on which they had set their hearts. The adoption of the principle of conciliation was the very best that could be adopted at the present important juncture. Their duty was to show their opponents that they were wrong, and themselves right; anything like menace should be avoided, for a generous mind would refuse to adopt any opinions that were dictated by force. Mr. M. O'Connell read a letter from Mr. Smith O'Brien, containing the following recommendations:—1. A sufficient staff of Repeal wardens to be appointed for every parish. 2. In every parish Repeal rent to be regularly collected, and forwarded to Dublin at least once a month. 3. In every town and village reading-rooms to be established. 4. The name of every Repealer in the kingdom who possesses the qualifications necessary to entitle him to the Parliamentary or Municipal franchise to be placed on the register of electors. Mr. M. O'Connell then read an abstract of the sums remitted to the Association by the city of Dublin, from January to September, 1844, from which it appeared that the aggregate amount of subscriptions during that period was 4439*l.* 19*s.* 10½*d.* Mr. M. J. O'Connell, Repeal Inspector-General for England, read a similar document from London, which showed that 1830*l.* 3*s.* 3*d.* had been subscribed from that city since July last. What did the Duke of Wellington and Sir R. Peel think of that? Yes, he pledged them his honour as an Irishman that there were 100,000 expatriated Irish Repealers in London, who were ready to co-operate with their countrymen in all their efforts. Much of the industry of England was with them, and he could assure them that at all the numerous meetings he had attended in that country, not one Englishman had ever uttered one offensive word to him or his cause. In the course of his speech, which was very long, the speaker expressed his delight that by the recent decision of the House of Lords, the packed jury system in Ireland, which had sent so many a brave fellow to the scaffold or the convict-ship, had met its death-blow. It had been said by some philosopher—"Get money—honestly if you can—but get money." So he (Mr. O'Connell) said, "Get your Parliament—honestly if you can—but have your Parliament." He, of course, meant a Parliament obtained by legal and constitutional means. He advised them to persevere; to consider those who were not with them against them; and to duck any person who attempted to inveigle them into secret societies. No power in Europe could trample on the standard of their liberties, and no Government spy could sap their freedom. They had a great leader. Napoleon was a great man, but his glory was obtained by the effusion of blood; and Washington suffered under the same stain, which, happily, did not blot the fame of him who was destined soon to open those doors whose hinges had been rusted for the last 45 years. They would, under his guidance, turn out the bankers, and see the Repeal flag floating proudly in College-green. All honour to the glorious—the immortal Denman, who had placed the wand of his legal knowledge within the portals of the House of Lords, whence it had come forth like the rod of Aaron—blossoming with justice to Ireland. They had got a Repeal army in London, and should 200,000 Russians land on the English coast tomorrow, if Her Majesty were pleased to call upon the Inspector of Repeal in London, he could tell her, "There are 100,000 fighting Repealers at your service this instant. Let me, please your Majesty, go out against these Russians with Paddy, and see what we can do." What did they suppose they would do? Beat the invading army to be sure—with their own weapons too—and return with their Repeal flag triumphant before the throne of the Queen. Peace, order, perseverance, and conciliation must be the instruments through which their independence would be achieved. By adherence to those principles they had hitherto defeated the objects of their enemies. They had fortified their barracks. He was glad to hear it, for the sake of the mason and the bricklayer. They had sent over splendid rifles and musketry, but he had not heard there had been much use for them, except shooting some rats about the barrack yards, and, please God, that time twelvemonth there would be still less use for them. The Irish people were loyal to the back-bone, but they owed no allegiance to the Tory faction, and they should pay them none. In conclusion, he told them, amidst tremendous cheering, that the happy day must soon arrive when they could say, in the words of the poet—

"We tread the land that bore us;
The green flag flying o'er us.
The friends we tried are by our side;
The foe we hate before us."

Mr. M. O'Connell, in reference to the last speech begged to say that he was afraid his esteemed relative thought in Irish, and found it difficult to express his ideas in English, and so was hurried into language which he could not approve of. The hon. gentleman then went on to make an elaborate repudiation of "the ducking" doctrine and the Parliament plan recommended by that gentleman, and to administer a gentle rebuke, which was very well received. Mr. H. Grattan handed in 4*l.* from Trim, county Meath, and then addressed the meeting at considerable length. He dwelt on the general discontent which at present prevailed—the manufacturer, the agriculturist, and the landed gentry were all equally dissatisfied. He declared he could not coincide with the declaration "that those who were not with us were against us." His colleague, Mr. Corballis, a Roman Catholic gentleman, was not with them, but he certainly was not against them; and he trusted the time was not far distant when he would be numbered amongst them. It was to the Catholic clergy, the safeguards of the morals of the people, that the salvation of the country was to be attributed. The Government would make an attempt to buy them as well as to sell the Protestant clergy; but he would tell the Catholic clergy that they would regret to the latest moment any pecuniary favour they might receive from the British Government.—After the disposal of some routine business, Mr. M. O'Connell announced the rent for the week to be 349*l.* 18*s.*

Killarney.—The reception of Mr. O'Connell at Killarney, on his way from Dublin to Derrynane, is described by a local Conservative paper as enthusiastic beyond measure. There was a procession on a monster scale, with the usual paraphernelia of flags, bands, and triumphal arches, in honour of the event. On reaching the Kenmare Arms, Mr. O'Connell addressed the people, and, towards the conclusion of his speech, thus touched upon the Repeal agitation in its present state:—Men of all parties, he said, were beginning to look on each other as fellow-countrymen—to hate each other less, and to love Ireland more. Catholic and Protestant were beginning to lay aside the shiboleth of party, and to find out that Ireland was indeed a country to be loved. He had come to invigorate his frame in his mountain home; but he would soon be at his post again. He had left the machinery after him. He had left Repealers and Federalists, Irishmen of different shades of opinion, working together in the cause of Ireland; and he would prophesy that the day was not far distant when they would have "Ireland for the Irish," and Kerry for Kerrymen. How could he thank the men of Killarney for the heart-warm, the splendid reception they had given him? It was not the first time the honest, leal-hearted, and he was proud to say, the temperate men of Killarney had exhibited their affection for him. That exhibition was a hundredfold dearer to him now than it would be at any other time; for it was an evidence that the thousands who surrounded him, though they might love their fellow-countryman much for his humble efforts in their behalf, were united to a man in their more intense and more transcendent love of Ireland. Never at the "monster meetings," where the energy and the patriotism of Ireland were concentrated as if animated by one great heart, had he felt such pleasure as he did at that moment; for, with the love of country and the hope of country which the vast array before him, combined in their moral power, presented to the mind, there was mingled the soft and the endearing associations which consecrate home. Oh! it made him young again to hear that cheer. There was a heart in that cheer. He then adverted to the state prosecutions. They had taken three months of his life away. How would he repay them? He would tell them; he would work harder than ever. (A voice—"Prosecute them.") No, you fool. (A voice—"Do.") No; but were they all listening to him? He would laugh at them, and that will be worse, for all Ireland would join in the laugh.

Limerick.—Mr. O'Connell was received with great enthusiasm in this place on his way to Derrynane. In his speech he said, "Repeal is coming. Many of the Protestant gentry have adopted the federal system, and are coming over to our ranks. We hail them as Irishmen and brothers. Thus united, and persevering in our peaceful and constitutional struggle, the day is not distant when we shall see a Parliament in College-green, and Ireland—what God and Nature intended her—prosperous and contented, happy and free."

Cork.—Lieut. Puddicombe, of the Royal Marines, whose case has excited so much interest, was brought to trial on Friday, before Mr. Plunket, Assistant Barrister, at the Quarter Session for the East Riding of Cork County. The charge, as our readers are aware, was "stealing plate" at a ball given by Capt. Warren. The Court-house was densely filled, and the trial occupied the entire day. Mr. Puddicombe called no witnesses, but was ably defended by counsel. The verdict of the Jury, after not more than five minutes' deliberation, was Not Guilty. The verdict was received with vociferous cheering by the crowded Court, and some time elapsed before order could be restored.

SCOTLAND.

Glasgow.—It is stated by the local papers that the intention, which has for some time been entertained, of inviting Professor Liebig to a public dinner in this city, is now in the way of being fulfilled. A large and influential committee has been formed to make the necessary arrangements, and the dinner is expected to take place about the 11th inst. The Earl of Eglinton has agreed to preside.—The inauguration of the Wellington statue will take place on Tuesday next, the 8th inst. It is not expected that the Duke of Hamilton will be present, and the duty of addressing the subscribers will devolve upon Sheriff Alison, the historian of Europe. The ceremonial will be chiefly military, and extremely simple.

Theatricals.

Drury-Lane.—On Monday Drury-Lane opened with an *éclat* which promises a brilliant season. This theatre has now assumed entirely the character of an opera-house. The musical company comprises the best dramatic singers that England can produce; and for the ballet, the array of talent rivals that of Her Majesty's Theatre. The theatre is complete, too, in all the accessories of an opera-house. The orchestra contains fifty performers, under the direction of M. Benedict; there is a strong chorus, and a numerous and effective *corps de ballet*. The opera of Monday was Balfe's *Bohemian Girl*, which was performed for the 81st time, and the ballet was a new one called the *Corsair*, composed by M. Albert. Miss Rainforth and Mr. Harrison were the principal singers in the opera, and on Tuesday Miss Delcy made her appearance in *Cinderella*, supported by Mr. S. Jones, Mr. D. King, and Mr. Harley. In the ballet the principal dancers were Mdlle. Dumilatre, Miss C. Webster, Mdlle. Delbés, MM. Albert, Montessu, &c.

Haymarket.—This theatre opened on Monday evening with Mrs. Centlivre's comedy of the *Busy Body*, one of the successful revivals of last season, and the afterpieces of *Used Up* and the *Milliner's Holiday*. After the first piece "God save the Queen" was sung by the company. During the recess the theatre has been repainted, and a new drop-scene has been painted by Mr. Marshall, representing an Italian seaport, with a stately palace in the foreground. The house was well attended, and the old favourites of the theatre met with a hearty welcome on their several entrances. The patrons of this theatre will learn with regret that Mrs. Nisbett has quitted the stage, and married a colonel in the army, holding a high appointment in the Customs. Mrs. Nisbett (then Miss Mordaunt) made her appearance at Drury-Lane in 1829, in the character of "Widow Cheerly" in the *Soldier's Daughter*, since which period, with the exception of two years after her marriage with the late Captain Nisbett, she has continued to be a member of Drury-Lane and the Haymarket, the latter being the last establishment in London where her professional exertions were exhibited.

Miscellaneous.

Tithe Commutation.—A Parliamentary document, moved for by Mr. Manners Sutton, has been recently printed, embracing returns of all agreements for the commutation of tithes, which have been confirmed by the Tithe Commissioners in the several counties of England and Wales, from the 1st of January to the 1st of July last, specifying also in each case the amount of rent-charge agreed to be paid in lieu of tithes, and showing whether the same be payable to appropriators, impropriators, or clerical incumbents; of all awards for the commutation of tithes which have been confirmed by the Tithe Commissioners in the several counties of England and Wales in the same period; and also of all appoint-

ments of rent-charges in the period mentioned. It appears that under the first branch—agreements for the commutation of tithes which have been confirmed by the Commissioners—the balance of increase was 691*l.* 17*s.* 0½*d.*, which, with the increase in former returns of 54,722*l.* 2*s.* 1½*d.*, makes the total increase 55,464*l.*, so that in England and Wales "rent-charges" will be the term used, instead of the ancient word "tithe," which existed from the earliest period, and was provided for the support of the clergy. By the second head—the awards for the commutation of tithes confirmed by the Commissioners—it is stated, that in England and Wales the total rent-charges of the present return were 92,360*l.* 6*s.* 5¾*d.*; the total rent-charges of former returns, 856,371*l.* 19*s.* 1½*d.*; and the total rent-charges, 948,732*l.* 5*s.* 5¾*d.*

Law.

COMMISSION OF LUNACY.—A commission *de lunatico inquirendo* was opened a few days since at Waltham Abbey, before Mr. Commissioner Winslow and a special jury of 16 gentlemen of the county of Essex, to inquire as to the state of mind of Mr. Thomas Telford Campbell, aged 39, only son of the late poet, Mr. Thomas Campbell, described in the commission as of "Dr. Allen's Asylum, High-beach, Essex, bachelor." The case excited the greatest interest in the neighbourhood, and the court was much crowded. The commission was taken out at the instance of the trustees, under the will of a relative, from which the subject of the Commission derives an annuity. The inquiry was rendered necessary by the demise of his father, under whose will, however, he takes no property. After the jury had been sworn, and the proceedings were about to commence, Mr. Campbell, having expressed a wish to be present, walked into the room unattended, and after bowing respectfully to the Court, took his seat by the side of the Commissioner. He is about 5 feet 5 inches in height, dark complexion, very good-humoured countenance, with a stout, robust, muscular frame. He throughout paid the greatest attention to the proceedings, and evinced no symptoms of a disordered intellect. The Commissioner having addressed the jury, explanatory of the laws of lunacy, Mr. Moxon addressed the jury at some length. He said that he appeared for the trustees for the annual payment of a sum of money to Mr. Campbell, and who felt it unsafe to continue such payment until a jury had decided as to the state of his mind. It was about 11 years since that Mr. Campbell's father, in consequence of some extraordinary conduct, had deemed it necessary for his protection to place him under the care of Dr. Allen, at his asylum, High-beach, Essex. He was sent there under the usual medical certificate, signed by Dr. Scott and another gentleman. Mr. Campbell had continued to reside there up to the present time, but for the whole period from his first entering the establishment, he had been fully at liberty, without the slightest confinement or restraint, as Dr. Allen deemed it a mild case, and only thought a little moral control necessary, such as restraining him from drink, to which he had formerly been accustomed; he therefore used to walk where he pleased daily after breakfast, returning to dinner, and again, season and weather permitting, until between 8 and 9 o'clock in the evening. He was a great pedestrian, frequently walking 30 or 40 miles per day; in fact, he was computed to have travelled over a distance of 80,000 miles during his residence at High-beach Asylum. He was particularly attached to the neighbourhood of Woodford and Epping Forest. He was perfectly harmless, but had several singular delusions. One was, that Chinn's lozenges, which he had formerly taken, had got into his bones and destroyed his constitution; and he had some time since accustomed himself to lie down in the sun in the forest, in order, as he said, to evaporate Chinn's lozenges out of his bones, and eradicate the diseases they had engendered. He took occasional dislikes to some of the inmates of Dr. Allen's, and had been known to attack some when, as he said, they got in his way in the passage, although on such occasions there was plenty of room for him, and he would afterwards say that he thought he ought to thrash them well. He had exhibited some extraordinary conduct to the tailor who worked for the establishment, and to the slaughterman who killed the beasts, &c., for the use of the inmates; in the latter case he had eaten part of the brains of an ox which had been just killed; he would have them warm from the head, without being cooked, and ate them without any bread. Mr. Moxon having detailed the delusions and general conduct in accordance with the subjoined evidence, expressed a hope, that whatever present appearances of sanity Mr. Campbell might present, the jury would not, after hearing the evidence, consider that his late lamented father had placed him unnecessarily under restraint; indeed, it could not be supposed that he could have so treated his only child, except for his due care and protection. Mrs. Mary Johnstone was then examined. She stated that her husband was a surgeon, of Dover-street, Piccadilly. She was an old friend of the family, particularly of Mr. Campbell's late mother. About 14 or 15 years ago witness was in London, and on a visit to Mrs. Campbell. She observed that young Mr. Campbell's manners were very peculiar. Once when at dinner he took offence because the footman accidentally removed his chair, upon which, without saying a word, he got up and left the table, went out of the house, and did not return for several hours. On other occasions, when the family would be taking lunch or other meals, he would sometimes take it into his head that he was not wanted, and would suddenly leave the room. When witness was about to depart, and wished to take leave of him, he, for no apparent reason, ran to his bedroom, locked himself in, and would not come out, although she went and knocked at his bedroom door; indeed, he became exceedingly excited, and, after some time, opened his door and remarked that witness was no lady for coming to a gentleman's bedroom, and he then refused to come out; in fact, shut the door in her face. She then thought, from his excited state and extraordinary conduct, that he was labouring under delusions, and that his mind was consequently impaired. Dr. Allen bore out a considerable portion of the learned counsel's statement, adding that Mr. Campbell was formerly allowed only 6*d.* per day pocket-money, but it had been latterly increased to 1*s.*, as although he had formerly drunk he had only got intoxicated about three or four times during the whole 14 or 15 years; and of late he had discontinued spirits, taking oatmeal as a substitute, and he, in consequence, got better in health generally. His dislikes to the other inmates were rather singular; he fancied they annoyed him, and one in particular he had taken an objection to; he said the very smell of him would make any man mad. He also appeared to dislike a lady who was an inmate, and also a lad who was in his (Dr. Allen's) employ. Neither party had given him any offence, and therefore his complaint that they annoyed him was without foundation. Mr. Campbell objected to wearing woollen garments, preferring corduroy trowsers, as being lighter and better to walk in; for the same reason also, he wore generally a coat and waistcoat of cashmerette, or some equally light material. He (Dr. Allen) had been 25 years conducting Highbeach Asylum, and had had great experience in cases of lunacy, and it was his opinion, that although Mr. Campbell was perfectly harmless, and very shrewd, yet that he laboured under certain delusions, and was decidedly of unsound mind. Mr. Johnstone, surgeon, of Dover-street, Piccadilly, husband of the first witness, was also of opinion that Mr. Campbell was not of sound mind. Henry Davis, tailor to Dr. Allen's establishment, proved Mr. Campbell's peculiar aversion to woollen cloths, and also the dislike he appeared to entertain for several of the inmates, as well as all connected with Dr. Allen's house. John Birkett stated that he was the butcher at Dr. Allen's asylum. Mr. Campbell was very fond of watching the operations of killing cattle, sheep, &c. When witness was slaughtering an ox, about three months since, Mr. Campbell was present, and said he should like to eat some of the brains. Witness said of course he would have them cooked, but Mr. Campbell said they were more pure and efficacious in their natural state, and actually ate them warm as they came from the head of the animal, without either having them cooked or eating a morsel of bread with them. William Roe, one of the attendants at Dr. Allen's, also gave evidence confirmatory of the previous testimony; and Mr. Carey, a surgeon, of Woodford, who had been in the habit of frequently meeting and conversing with Mr. Campbell during his rambles, was called on the part of the latter to testify as to his sanity, but he agreed with the other two medical gentlemen, that Mr. Campbell was decidedly of unsound mind. Mr. Campbell put several questions to the witnesses, and occasionally made some very pertinent remarks, observing that the witnesses had given their evidence very fairly, but were wrong in their conclusions; and explained to the jury such parts of the evidence as he seemed to think bore against him. He said,—"I did not eat the whole of the brains of the ox, but only a small portion, and therefore the witness Birkett must be mistaken. Mrs. Johnstone must also be mistaken. I did not behave in the way she described; the fact is, I was unwell, and confined myself to my room, and did not want to be disturbed. I suppose I offended my father because I did not seem to think enough of myself. He wanted me to go more into society, which I did not feel disposed to do. I have not been particularly well educated. I was sent to school in France, but I ran away from it, and was stopped at Boulogne because I had no passport, and was detained there till proper inquiries were made." He ran away from school because he was not comfortable. He had given the solicitors the names of certain witnesses, who could speak as to his general conduct, at Woodford, &c., but none of them, excepting Mr. Carey, had attended. This he regretted, as the result of the inquiry might in consequence be unfavourable to him, but he hoped the jury would take that circumstance into their consideration, as it had arisen from his ignorance of the law, and he trusted his case would not thereby be affected. He would suggest that the inquiry should be adjourned, to procure the attendance of those witnesses.—[It was here explained to Mr. Campbell that such matter was not of sufficient importance to require an adjournment, upon which he appeared satisfied.] Mr. Campbell then went on to say, that the fact of a man being locked up in a madhouse for some years would lead people to suppose he was mad. Of the annoyances to which people were subjected in such establishments none could form any idea who had never resided in them—none could imagine the effect of constant association with insane persons. Whatever decision the jury might arrive at, he was himself satisfied that he was perfectly sane. Mr. Campbell throughout conducted himself with the greatest urbanity, coolness, and composure; indeed, no one could have supposed that he had been an inmate of a lunatic asylum, or that his intellects had been impaired. Mr. Commissioner Winslow summed up with so much clearness and impartiality, that counsel deemed it unnecessary to offer any observations. The jury, after a brief consultation, retired; and, after an absence of nearly an hour, the foreman announced, that although he and another juror objected to give a verdict at variance with the medical testimony, yet that 14 jurors out of the 16 were of opinion that Mr. Campbell was of sound mind. A verdict was accordingly recorded, "That Mr. Thomas Telford Campbell was of sound mind." Mr. Campbell immediately after removed his luggage from Dr. Allen's, and took apartments at the house of the late Mr. Sotheby, the poet, near Woodford.

SPORTING.

NEWMARKET FIRST OCTOBER MEETING.—*Tuesday.—Hopeful Stakes* of 40 sovs each, h ft; for 2-yrs old colts, 8st 7lb; and fillies, 8st 5lb. 20 subs. Mr. Gully's Maid of Orleans beat Mr. Ford's Piccolina and the following, which were not placed:—Lord Chesterfield's c. by Sheet-Anchor, Lord Exeter's Deodare, Mr. Newton's f. by Jerry, Colonel Peel's Sister to Chameleon, Duke of Richmond's Laird o' Cockpen, and Duke of Rutland's c. by Royal Oak. Won in a canter by a length. *Grand Duke Michael Stakes* of 50 sovs each, for 3-yrs old colts, 8st 7lb; and fillies, 8st 3lb. 23 subs. Mr. Irwin's Foig-a-ballagh beat Duke of Richmond's Red Deer, Lord Exeter's Merope, Colonel Peel's Zenobia, and Lord G. Bentinck's All-round-my-Hat. The running for the first mile was made by All-round my-Hat; it was then taken up by Foig-a-ballagh, who went on with it to the end at a tremendous pace, shook off everything but Red Deer at the new ground, and defeated him with the greatest imaginable ease by two lengths.—*Buckenham Stakes* of 300 sovs each, h ft; colts, 8st 7lb; and fillies, 8st 4lb. Lord G. Bentinck's Cowl beat Mr. Wreford's c. by Camel out of Monimia, and Lord Exeter's Adrianople. Won easily by a length. This race was run in a heavy shower.

WEDNESDAY.—*St. Leger Stakes* of 25 sovs each; for 3 yrs old colts, 8st 7lb; fillies, 8st 4lb. D. I. 6 subs. Duke of Richmond's Pastoral beat Mr. Dixon's Oliver Cromwell and Mr. Bristow's Freystrop. Won by about 12 lengths.—*Sweepstakes* of 200 sovs each, h ft; for 3 yrs old, 9st 3lb; and 2 yrs old, 7st 3lb. 4 subs. Lord George Bentinck's All-round-my-Hat, 3 yrs, beat Lord Albemarle's Scarmentado, 2 yrs, by two lengths.—50*l.*; for 3 yrs old, 7st 5lb; four, 8st 8lb; five, 8st 13lb. Mr. Newton's Ma Mie, 5 yrs, beat Sir J. Hawley's Vibration, 5 yrs, and Lord Exeter's Revocation, 5 yrs. Won by a head.

THURSDAY.—*Sweepstakes* of 5 sovs. each, for 2-yrs olds, 6st 10lb; winner to be sold for 70*l.*, &c. 3 subs. Lord Albemarle's Alexandrina, 2 yrs, and Mr. Deakins's Caractacus, 2 yrs, ran, but it was a dead heat; it was agreed to divide the stakes, and Alexandrina walked over. *Town Plate* of 50*l.*, for 3-yrs olds, colts 8st 7lb, and fillies 8st 3lb. Duke of Richmond's Pastoral beat Lord Exeter's Merope, and Lord Albemarle's Candidate, by at least 20 lengths. *Handicap Sweepstakes* of 15 sovs. each, 10 ft, for 2-yrs olds. 3 subs. Duke of Richmond's Laird o' Cockpen, 8st 7lb, beat Col. Peel's f. by Slane, 7st 11lb, and Lord Exeter's Petronna, 7st 2lb; won by a neck. *Rutland Stakes* of 30 sovs. each, 20 ft; for 2 yrs olds; colts 8st 7lb, and fillies 8st 3lb. 11 subs. Duke of Bedford's Prologue beat Lord Albemarle's Tisiphone and Duke of Richmond's f. by Glaucus out of Estelle, and four others; won by half a length. *Queen's Plate* of 100 guineas; for 3-yrs olds, 9st 2lb; 4-yrs, 10st 7lb. Duke of Richmond's Pastoral, 3 yrs, beat Mr. Dixon's Oliver Cromwell, 3 yrs, Lord Albemarle's Robinia, 3 yrs, and Lord Exeter's Wee Pet, 4 yrs; won by three lengths. *Matches*—Mr. Ford's Sir Diggory Diddle, 3 yrs, 8st, beat Mr. E. Walker's black cob horse (h. b.), 6 yrs, 7st, by six lengths; 150, h ft. Mr. Ford's Piccolina, 8st 3lb, beat Mr. T. Theobald's Desperation, 8st 7lb, by half a length.

BIRTHS.—On the 16th ult., the lady of T. E. SCOTT, Esq., of Carbrooke, Norfolk, of a son—20th ult., at Sligo, Ireland, the lady of Capt. W. B. KELLY, Her Majesty's 22d Regiment, of a son—23d ult., at Henfield, the lady of the Rev. C. DUNLOP, of a son, still-born—24th inst., at Lyncombe-hill, Bath, the lady of J. B. CARDALE, Esq., of a daughter—24th ult., at Kent-terrace, Regent's Park, Mrs. J. M. LEE, of a daughter—25th ult., in Connaught-square, the lady of Commander J. G. DICK, R.N., of a daughter.

MARRIAGES.—On the 18th ult., at the British Embassy, Berne, and afterwards according to the rites of the Roman Catholic Church, Capt. H. SMITH, R.N., C.B., to ANNA COSTIGIN, daughter of the late S. Costigin, Esq., of Dublin—21st ult., at Dartington, the Rev. W. MALLOCK, B.D., of Baliol College, and rector of Cheriton Bishop, in the diocese of Exeter, to MARGARET FROUDE, only daughter of the Venerable R. H. Froude, Archdeacon of Totnes—24th ult., at St. Margaret's, Westminster, J. S. THORNTON, eldest son of the late Captain Thornton, to MARY A. E. BONING, eldest daughter of Mr. Boning, of Westminster—25th ult., at the church of the Holy Trinity, Bristol, Major R. BRERETON, late of the 42d Royal Highland Regiment, to Miss A. MAMGAY, eldest daughter of the late T. Mamgay, Esq., of Hewlet, Haute Ville, in the Island of Guernsey—26th ult., at Newark, the Rev. J. G. BUSSELL, vicar of Newark-upon-Trent, to JULIA HODGKINSON, eldest daughter of G. Hodgkinson, Esq., of the above place.

DEATHS.—On the 20th ult., at Farnham Royal, Bucks, after a long and painful illness, ANN KINNAIRD, the beloved wife of H. Kinnaird, Esq., of Her Majesty's Household—21st ult., at Oxford, A. S. C. BUCKLAND, youngest son of the Rev. Dr. Buckland, canon of Christchurch—21st ult., after a severe illness, J. TAYLOR, Esq., late of the Royal Exchange Insurance Office, and author and laborious compiler of many celebrated works of literature, aged 82—21st ult., at Sarum, Wilts, J. LEWIS, Esq., of Wheeler-place, Haverstock-hill, aged 79—22d ult., at Raywill, near Hull, ISABELLA SYKES, relict of D. SYKES, Esq., formerly Member of Parliament for that town, aged 79—23d ult., at the vicarage, Swinderby, Lincolnshire, MARY CLARKE, the beloved wife of the Rev. W. J. Clarke—26th ult., at S. Lambeth, ELIZ. PITTAR, wife of J. Pittar, Esq., and youngest daughter of the late T. Holmes, Esq., of Farm-hill, county of Sligo, aged 64—26th ult., at Christ's Hospital, E. H. RICE, of University College, Oxford, eldest son of the Rev. Dr. Rice—28th ult., at his seat, Stoke Park, Bucks, G. PENN, Esq., aged 83.

THE HAIR.—Of the numerous compounds constantly announced for promoting the growth, or reproduction of the Hair, few survive, even in name, beyond a very limited period, whilst ROWLAND'S MACASSAR OIL, with a reputation unparalleled, is still on the increase in public estimation. The singular virtues of this successful invention for Restoring, Preserving, and Beautifying the Human Hair, are too well known and appreciated to need comment. The very facts of the high and distinguished patronage it enjoys, its general use in all countries, together with numerous testimonials constantly received in its favour, are authorities which stamp its superior excellence and title over all attempts of a similar nature. Being universally preferred, its consequent great demand excites the cupidity of unprincipled shopkeepers, who vend the most spurious trash as the "genuine" Macassar Oil: whereas, the genuine article is wholly the invention and property of A. ROWLAND and SON, and the amalgamation of its costly exotic materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "Macassar Oil." The genuine article has the words

ROWLAND'S MACASSAR OIL,

engraved in two lines on the wrapper; and on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per Bottle. Sold by the Proprietors at 20, Hatton Garden, and by Chemists and Perfumers.

*** All other Articles sold under the same name are FRAUDULENT COUNTERFEITS.

SUPERIOR WATERPROOF WRAPPERS, OUTSIDE GARMENTS of all kinds, SHOOTING JACKETS, &c.—An extensive variety of the above in new and greatly improved materials (in lieu of the unsightly and vulgar Tweeds) now ready; also of BERDOE'S well known and much approved VENTILATING FROCKS for all seasons, guaranteed to exclude any rain whatever. As winter approaches, attention is again invited to the Advertiser's VENTILATING WATERPROOF, which renders any garment thoroughly impervious to rain. This fact is established beyond all contradiction by more than six years' extensive and most successful trial.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill, North side.

WANT PLACES.—All Letters to be post-paid.

AS HEAD-GARDENER.—A young Man, aged 36, who is thoroughly acquainted with Gardening in all its various branches. Can give six years' satisfactory reference to the gentleman whose service he is about to leave. If required, has no objection to the management of Forest Plantations or Meadow Land. No objection to any part of Great Britain.—Direct to T. W. W., Post-office, Gloucester.

AS HEAD-GARDENER.—A married Man without incumbrance, who perfectly understands his business in all its various branches. Can be highly recommended by the gentleman he has served two years, and other gentlemen if required. Direct to A. C., Mr. Hoskins, Seedsman and Florist, Norwood, Surrey.

AS GARDENER.—A respectable married Man, aged 36, who understands his business in all its branches, having lived in Noblemen's and Gentlemen's Families for the last 22 years, and has had the management of Pines and Early Forcing in his last situation, which he has left on account of his master making alterations in his establishment. Can have an unexceptionable character.—Direct to T. V., Mr. Cutbush, Highgate, Middlesex.

AS GARDENER.—A young Man, aged 26, who has a perfect knowledge of his profession in all its various branches, and has had considerable experience for the last seven years. A good character will be given.—Direct to A. P., Post-office, Studley, Warwickshire.

AS GARDENER.—A respectable married Man, who understands the management of a Greenhouse, also the Kitchen and Flower-Gardens; has no objection to take charge of a Horse or a Cow. Can have an unexceptionable character from his last situation.—Direct to J. B., Gloucester Grove East, Old Brompton.

AS GARDENER.—A young Man, aged 21, who has had nearly five years' experience under a good gardener; has no objection to attend to a horse and chaise, and can have an unexceptionable character.—Direct to A. B. C., Mr. R. Unwin, near the Brewery, Leyton, Essex.

AS GARDENER.—A Married Man, aged 37, without incumbrance, who thoroughly understands his business, with Land and Stock, if required; can have five years' character, and be strongly recommended by the gentleman he has just left. Direct S.W., No. 4, Westbourne-street, Pimlico.

A YOUNG MAN, 24 years of age, who has been brought up to the Nursery and Seed Business, wishes to meet with a Situation in a Seed-shop, where he could obtain a further knowledge of the Business. No salary would be required for the first year. Respectable reference and security can be given.—Direct to H. M., Office of this Paper.

A YOUNG MAN having a desire to learn the NURSERY business, wishes to engage himself to a Nurseryman with whom he could make himself useful. Character will bear the strictest inquiry.—Direct to J. M., care of J. Bruce, at Mr. Noble's, 152, Fleet-street, London.

TO SEEDSMEN, &c.

A RESPECTABLE YOUNG MAN, 18 years of age, wishes for a situation; a moderate salary only required.—Direct to H. P., care of Mr. Clark, Seedsman, &c., Bishopsgate-street, City.

AS FARM BAILIFF.—A Man without incumbrance; he understands farming and stock. His Wife understands the Dairy and Poultry, and both are willing to make themselves useful, and can have a good character from their last place. Direct to M. A., care of Mrs. Hancock, Bedford-road, Clapham, Surrey.

FIVE POUNDS will be given by the Advertiser, a Young Man aged 26, to any individual who will procure for him a situation as GARDENER, or Second, in a good establishment; he has had 9 years' experience in good situations in Scotland and England, from which the fullest references can be given.—Direct to A. Z., at Mr. Cullin's Nursery, Leamington, Warwickshire.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

GARDENERS' BENEVOLENT INSTITUTION.—NOTICE IS HEREBY GIVEN that an Election for **FOUR PENSIONERS on the Funds of this Institution will** take place on WEDNESDAY, 22d Jan. next. All persons desirous of becoming Candidates are requested to send in their Testimonials, &c. on or before FRIDAY, 1st Nov. next, after which time they will not be received.

Printed Forms may be had on application to E. R. CUTLER, Secretary, 97, Farringdon-street.

LILIUM LANCIFOLIUM. — Flowering Bulbs of these most beautiful LILIES to be had at the following low prices: Lancifolium **album** . . **5*s*. each.**
„ **punctatum** . **5*s*.** „
„ speciosum . 25*s*. „
of W. J. NUTTING, Seedsman, 46, Cheapside, London.
Seed from the best varieties of IXIAS and SPARAXIS, at 2*s*.6*d*. per packet.

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may be had at the Nursery, and of Messrs. WARNER & WARNER, Cornhill, London, after the 7th September.

BAGSHOT NURSERY (late HAMMOND'S).

GEORGE BAKER, late of Knap-hill, has to inform his Friends and the Public, that, under an agreement entered into in July last, he has become the tenant of the Bagshot Nursery Grounds, formerly for many years occupied by Mr. HENRY HAMMOND. Mr. BAKER is adding considerably to the stock, rendering it superior in quality and of greater variety than has hitherto been kept at this Nursery. All letters addressed to Mr. BAKER, Bagshot Nursery, Surrey, will be punctually attended to.

CARNATIONS, PICOTEES, PINKS, AURICULAS, ALPINES, AND POLYANTHUS.

JOHN HOLLAND, FLORIST, &c., Market-place, Middleton, near Manchester, Lancashire, respectfully informs his Friends and the Floricultural Public that his extensive and choice collection of the above Florists' Flowers are now ready for sending out, Catalogues of which are now ready, and may be had on prepaid application.

Market-place, Middleton, October 11.

THE GREATEST NOVELTY EVER OFFERED TO THE PUBLIC.

RHODODENDRON JACKSONII.—**This splendid** new hardy Rhododendron is confidently recommended as the most beautiful variety extant; it surpasses in the colours of its flowers the richest Geranium, and is quite a new feature in this noble family. It forces well, is a free bloomer, and of dwarf habit. A truss of flowers was transmitted to Dr. Lindley, who pronounced it "a very compact and handsome variety," with "great richness" in its general appearance, &c. See *Gardeners' Chronicle* of the 6th April last, page 216, "*Rhododendron*.—*C. L. N.*" To be sent out in March, at 10*s*. 6*d*. each.

WM. JACKSON and Co. beg also to call the attention of the Nobility, Gentry, and the Trade to the following rare and valuable Rhododendrons, all warranted true, at the very low prices attached. The plants are from seed, fine and stout, twice transplanted.

Rhododendron campanulatum, averaging 1 inch, 3*l*. per 100.

HYBRIDS

Between R. campanulatum and the scarlet arborea, 2 in., 3*l*. p. 100
„ „ and R. venustum, 1 inch . 2*l*. „
„ „ „ maximum . . 3*l*. „
„ „ „ nivaticum, 1 inch . 7*l*. 10*s*. „
„ „ „ Catawbiense, 1 inch 7*l*. 10*s*. „

Usual Discount to the Trade on the above.

Cineraria Celestial, No. 1, 2*s* 6*d*. each; do. Fairy, No. 2, 2*s*. 6*d*. each; 5*s*. per dozen. Strong plants well established. See Dr. Lindley's opinion in the *Gardeners' Chronicle* of April 6th, page 216, under the letters "*C. L. N.*," and Advertisement of Aug. 24th.

WM. J. and Co. take this opportunity of stating that in consequence of the great success they have had in propagating the above beautiful Cinerarias, they have reduced the price, which will be applicable to all who have already favoured them with their orders, which will be executed next month, and plants given to compensate for long carriage.

Their new Catalogue is now ready (in which is a list of their fine white and scarlet Rhododendrons), and may be had on application. A remittance or reference will be expected from unknown correspondents.

Agents in London: Messrs. WHITLEY and OSBORN, Fulham Nursery, who have seen the plants.

Cross Lanes Nursery, **near Bedale, Yorkshire, Sept. 30.**

THE NEW SUPERB SEEDLING PICOTEE,
"BURROUGHES'S DUKE OF NEWCASTLE."

YOUELL & CO. have much pleasure in announcing they will send out for the first time the above splendid light-edged purple Picotee, raised by the Rev. J. Burroughes. It is guaranteed to surpass any Purple Picotee that has yet been raised. Without commenting further upon its superiority, Y. and Co. beg to refer to a report in a late No. of the *Gardeners' Chronicle*, as follows:—

"The *Duke of Newcastle* is a flower of first-rate properties; it is a light-edged purple; the petals are large, and of good form **and substance; even on the edge; the colour unbroken**: the pod good, and with less disposition to bar than is common." It obtained the first prize, as the best seedling, at the Norfolk and Norwich Horticultural Exhibition. Price 21*s*. per pair. The **stock being limited, to prevent disappointment early orders are** respectfully requested. Y. & Co. are also enabled to supply the following superb Picotees, raised by the same gentleman, all possessing first-rate properties, and have been exhibited and obtained first class prizes at several of the metropolitan Exhibitions of the present year. They are as follow:—

Burroughes's Mrs. Benyon, Red Picotee	7*s*.	6*d*.
„ Lady Alice Peel, Rose Picotee	7	6
„ Miss Jane, Purple Picotee	7	6
„ Mrs. Bevan, Red Picotee	7	6
„ Enchantress, Scarlet Picotee	5	0

CARNATIONS AND PICOTEES.

Y. and Co.'s collection of this beautiful tribe of flowers will be found the most extensive and select in Europe, comprising every known variety of merit. The plants are remarkably strong and healthy, and ready for sending out to any part of the United Kingdom and the Continent at the following prices:

				£	*s*.	*d*.
12 pairs extra fine and very superior first-class Show Flowers				2	10	0
25	ditto	ditto	ditto	5	0	0
12	ditto	ditto	Show Flowers	1	10	0
25	ditto	ditto	ditto	3	0	0
12 pairs of Extra fine Show Pinks				0	12	0
25	ditto	ditto	ditto	1	1	0

The selection being left to Y. and Co.

Great Yarmouth Nursery, Oct. 10, 1844.

J. KERNAN begs to announce the arrival of his large and carefully selected Dutch, Cape, and other Bulbs of every description.

Finest named Hyacinths, old favourites, from 6*s*. to 12*s*. and 18*s*. per dozen.

Double red mixtures, different shades, 3*s*. 6*d*. per dozen.

Double blue, 3*s*. 6*d*. per dozen.

Double white, 3*s*. 6*d*. dozen.

Single, each colour, as above, 3*s*. 6*d*. per dozen.

Early Tulips, Narcissus, Jonquils, Anemones, Ranunculus, Iris, Ixias, Amaryllis, with all the new Lilies and good Herbaceous Plants, hardy and greenhouse, worth cultivating.

J. K. has also to offer, of this season's saving, some very **choice seed—**

From the finest named Calceolaria, 2*s*. 6*d*. per packet.
„ „ Cineraria, 2*s*. 6*d* „
„ „ Heartsease, 2*s*. 6*d*. „
„ „ Geranium, 2*s*. 6*d*. „
Scarlet Phlox Drummondii, 6*d*. per packet.
Schizanthus Hookeri, 6*d*. „
Intermediate Stock, 6*d*. „

(By sowing the above this autumn a season will be saved.)

With many other good Biennials and Perennials. Also, Myatt's new Deptford Pine Strawberry; Myatt's British Queen do.; Prince Albert do., Lady's Finger do., Keen's Seedling do., Old Pine do., &c., &c.

Dulley's Scarlet Admirable Rhubarb, the very best for early forcing. Giant Asparagus and Sea-kale Plants. Rivers's new Catalogue and Amateur's Rose Guide.

White Clover, Rape, Winter Tares, Rye, and Italian Rye-grass, for early green food. Catalogues may be had on application. All Mr. Rivers's Dwarf and Standard Roses may be ordered through J. K.

Curtis's and other new Budding and Pruning Knives.

4, Great Russell Street, Covent Garden, Oct., 1844.

CAMELLIA JAPONICA.

ROBERT LAWSON, Esq., of Tiverton, intends disposing of his stock of Camellias, which he has collected at much expense, and successfully cultivated for many years. **They are in the highest state of health, and most abundantly** set with blooming buds. Mr. L. disposes of them solely in consequence of their having become too large for his conservatory. They are as follow:—

				£	*s*.	*d*.
Reticulata,	from 7 to 8 feet in height,	a very fine specimen, quite healthy and green		10	10	0
Imbricata,	from 7 to 8 feet in height,	do.		8	8	0
„	„ 3 to 4	„		1	10	0
Eximia	„ 7 to 8	„	a magnificent plant	7	7	0
Chandlerii	„ 6 to 7	„	a fine plant	5	5	0
„	„ 3 to 4	„		1	10	0
Lady Hume's Blush	6 to 7	„	fine	4	4	0
Double White	6	„		5	5	0
„	„ 5 to 6	„		3	10	0
„	„ 5	„		2	10	0
Invincible (Gray's)	5 to 6	„		3	3	0
Fordii	„ 4 to 5	„	very fine	4	4	0
„	„ 2 to 3	„		1	1	0
Double Striped	5 to 6	„	fine	2	10	0
Anemoneflora Alba	4 to 5	„		2	10	0
Speciosa	„ 4 to 5	„		2	2	0
Woodsii	„ 4	„	fine	2	10	0
Warratah	„ 4 to 5	„	fine	2	2	0
Florida	„ 4 to 5	„		2	10	0
Corralina	„ 3	„		1	5	0
Lawsonii	„ 2	„	new	1	10	0
Colvillii	„ 2	„		0	10	6
Donkelærii	„ 2	„		0	10	6
Insignis	„ 6 to 7	„	very fine	2	10	0
Eclipse (Press's)	6 to 7	„		3	3	0

The Prices affixed are for the separate plants, of which not less than 8 can be taken together. If the whole are taken in one lot a considerable reduction will be made. Mr. Lawson will be happy to show them, or give any further particulars that may be required.—Tiverton, Oct. 11th, 1844.

NEW AND VALUABLE PLANTS.

R. GLENDINNING respectfully begs to offer the following very desirable Plants:—

CLERODENDRON INFORTUNATUM, 42*s*.—This is by far the finest species of this genus yet introduced, a plant of which was exhibited by R. G. at the Chiswick Show, in June last, and awarded the Large Silver Medal as a New Plant. It flowers freely in a dwarf state, and will remain in flower in a cool greenhouse six months. It is figured by Dr. Lindley, in the "Botanical Register" for April, and in "Paxton's Magazine of Botany" for August last.

Achimenes picta, 7*s*. 6*d*.
Budleya Lindleyana, 7*s*. 6*d*.
Barnadesia spinosa, 10*s*. 6.
Correa Gouldei, 3*s* 6*d*.
Clerodendron splendens, 5*s*.
„ lævifolium, 5*s*.
Cyrtoceras reflexa, 10*s*. 6*d*.
Echites splendens, 42*s*.
„ hirsuta, 5*s*.
„ atropurpurea, 7*s*. 6*d*.
Gardenia Rothmanii, 5*s*.
„ Sherbournæa, 42*s*.
Gesnera macrochiza, 10*s*. 6*d*,
*Gloxinia Cartoni, 5*s*.
„ maguiflora, 5*s*.
„ bicolor, 5*s*.
Gonolobus hirsutus, 12*s*.
Hindsia longiflora, 7*s*. 6*d*.
Jasminum Bidwellianum, 5*s*.
Lasiandra cunthiana, 10*s*. 6*d*.
Pentas carnea, 2*s*. 6*d*.
Physianthus auricomus, 42*s*.; the flowers of this creeper are as large as Stephanotus, of a creamy white colour, and sweet-scented.
Portlandia grandiflora, 10*s*. 6*d*.
Rondeletia, 42*s*.; a most beautiful new species, with long yellow flowers, from Havanna.
Siphocampylus lantanifolius, 7*s*. 6*d*.
Do. glabriuscula, 7*s*. 6*d*.
Tacsonia molissima, 5*s*.

*** See the "Botanical Register" for August last, in which these are figured.

Chiswick Nursery, near London, October 11, 1844.

THOMAS JACKSON, Kingston Nursery, Surrey, Oct. 11.

TRAINED PEACHES AND NECTARINES.

WM. E. RENDLE respectfully informs the Nursery Trade that he has this season a large stock of TRAINED PEACHES AND NECTARINES, strong, healthy, and in excellent condition.—Union-road Nursery, Plymouth, Oct. 7, 1844.

NEW CARNATIONS, PICOTEES, AND PINKS.

MESSRS. N. and B. NORMAN'S CATALOGUE of SHOW VARIETIES can be had on prepaid application.—Bull Fields, Woolwich.

KINGHORN'S SEEDLING CALCEOLARIAS.—In answer to numerous communications, F. R. Kinghorn begs to inform the Public that Mr. Gaines possesses the entire stock of the following Seedlings, viz., Duchess of Sutherland, Lady Ann Charteris, Professor Wilson, and Kinghornii, exhibited by F. R. K, at the Horticultural Gardens in May, and the first two at the Royal Botanic Gardens in June. See *Gardeners' Chronicle*, May 25th, page 338, and Mr. Glenny's opinion of them in the *Gazette*, page 319; and in answer to a correspondent in the *Gazette* of last Saturday. F. R K. had the able assistance of Mr. Glenny in selecting the above from his numerous Seedlings previous to the Exhibitions. Nevertheless, the others in possession of Messrs. May and Gaines are very fine desirable varieties.—Taplehouse, Oct 11, 1844.

DOUBLE ROMAN and PAPER-WHITE NARCISSUS, 1s per dozen. The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. Cobbett's, late Mr Barron's, Italian and Foreign Warehouse, 18, Pall Mall. Also Dutch Hyacinths, Crocus, Tulips, Anemones, &c. &c. Price Catalogues of which may be had per Post.

TULIPS, HYACINTHS, RANUNCULUSES, ANEMONES, GERANIUMS, AURICULAS, CARNATIONS, and LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment Florist to Her Majesty, begs to recommend to the attention of the Nobility, Gentry, and Public his extensive assortment of the above Flowers, which, from the success he has had in their cultivation, he can offer at very moderate prices. He particularly wishes to call attention to the highly-flattering remarks on his Exhibitions of Tulips and Lilium lancifolium this season, in the various papers. He is also desirous of reminding the Nobility, Gentry, and Amateurs, who may wish to add to their collections or ornament their parterres with these beautiful flowers, that this is the best season to make a selection. The varieties of the splendid Lilium lancifolium are particularly adapted for parterres, as, besides being quite hardy, they flower at a time when the Nobility and Gentry are at their country seats, and when flowers are so much wanted. They only require to be known to be universally cultivated. Catalogues can be forwarded by post on application. Foreign orders executed.

GERANIUMS AT VERY LOW PRICES.

WM. E. RENDLE, having a large stock of the following sorts of GERANIUMS, is enabled to offer them at very low rates.

*** A dozen will be forwarded on receipt of a Post-office order, including hamper, package, and carriage free to the Exeter terminus of the Great Western Railway.

Class 1.—30*s.* per dozen, including package, carriage, &c.—Conflagration, Pulchellum, Jersey Maid, Lady Villiers, Fascination, Diomede (Rendle), Symmetry, Thunderer, Dido, Cordelia, Oberon, Favourite, Prince of Waterloo, Jessie, Count D'Orsay, Constellation, Lavinia, Cornish Gem, Attila, Duke of Cornwall, and Sunrise.

Class 2—25*s.* per dozen, including package, carriage, &c.—Evelina, Gipsey, Witch, Hamlet, Cynthia, Aurora, Creole, Lady Cotton Sheppard, Countess of Mount Edgcumbe, Fair Maid of Devon, Wonder of the West, Portia, Jupiter, Life-guardsman, King John, Sultan, and Princess Royal (Lyne).

Class 3.—15*s.* per dozen, including package, carriage, &c.—Camilla, Consort, Van Amburgh, Enchantress, Glory of the West, Ivanhoe, Flash, Queen of the Fairies, Grand Monarch, Amethyst, Wildfire, Mabel, Prince Albert, Nymph, Bridegroom, and Sybil.

All the plants are strong, healthy, and well established, and will be forwarded immediately on receipt of invoice.

Union Road Nursery, Plymouth, Oct 7, 1844.

SUPERB SHOWY SEEDLING CINERARIAS, for this autumn and winter flowering.

Dwarf, bushy plants, well trussed for bloom, in 32-sized pots, 12*s.* per dozen.

Do. do. in 48-sized pots, 9*s.* per dozen.

The above can be confidently recommended as being saved from the very choicest and most superb kinds, comprising every shade of beautiful light and dark-blue tints, and admirably adapted for the furnishing of the greenhouse or drawing-room, throughout the autumn and winter months. Seed selected from the same, 2*s.* 6*d.* per packet.

THUNBERGIA CHRYSOPS.—Plants of this beautiful Creeper, rich purple flower, with golden eye, 7*s.* 6*d.* each.

M. B. has a large stock of the following STRAWBERRIES:—

Myatt's British Queen	6*s.* per 100.
Do. Eliza	6*s.* ,,
Emperor, variety from Keen's Seedling	3*s* ,,
Green-flesh Pine, small fruit, fine flavour	3*s.* ,,
Elton Pine	2*s.* 6*d.* ,,
Keen's Seedling	2*s.* 6*d.* ,,

Applications, including post-office orders, will be immediately and carefully executed, addressed to Michael Brewer, Sen., London-road Nursery, Cambridge.

HERTFORD NURSERIES.

E. P. FRANCIS begs respectfully to inform the Nobility, Ladies, and Gentry, that his descriptive CATALOGUE OF ROSES will be ready for delivery on and after the 16th of October, and will be forwarded gratis upon application, and which comprises upwards of a thousand varieties.

E. P. F. takes this opportunity of stating that he has made an addition of several acres of land, and that his Nurseries now extend over 25 acres of ground, containing a large stock of Fruit and Forest Trees, which are in fine and healthy condition; a fine assortment of Trained Trees, Evergreens, and Flowering Shrubs, all of which may be had upon the most reasonable terms. Catalogues may be obtained with Prices attached. Carriage of all goods paid to London.

NEW PLANTS.

MESSRS. VEITCH and SON have now ready for sending out the two undermentioned beautiful New Plants, viz.:—

Hindsia violacea. Strong plants at 63*s.* It is figured by Dr. Lindley, in the "Botanical Register" for August last, who there says—"The Hindsia violacea is one of the finest things obtained from South Brazil. It has been imported by Messrs. Veitch and Son, of Exeter, who received for it the Large Silver Medal at the Horticultural Society's Garden Exhibition in May last. It will doubtless prove a very easily cultivated Greenhouse Plant; and is certainly unsurpassed in beauty by blue-flowering shrubs."

Clitoria fulgens. Strong plants at 42*s.* This plant was exhibited at Chiswick, in May, under the name of Centrosema species, and received the Knightian Medal. See Report in *Gardeners' Chronicle* for May 25. It is figured in "Paxton's Magazine" for July last.

Messrs. V. and Son have also to offer the following fine plants, viz.:—

Achimenes picta
Allemanda grandiflora
Barbacena squamata Veitchia
Clerodendron lævifolium
,, splendens
Cyrtoceras reflexa
Echites atropurpurea
,, hirsuta
,, splendens
Gardenia Rothmannia
Gardenia Sherbourneæ
,, tetrasperma
Gesneria polyantha
Gloxinia Cartonii
Hindsia longiflora
Inga pulcherrima
Luxemburgia ciliosa
Passiflora actinea
Pentas carnea
Thunbergia chrysops, &c. &c.

N.B.—Messrs. V. and Son's General Catalogue can be had on application.—Exeter, Oct. 11, 1844.

JOHN SLATER, Florist, Cheetham Hill, near Manchester, respectfully calls the attention of the Floricultural Public to his large and select collection of the following Florists' Flowers:—TULIPS, AURICULAS, POLYANTHUSES, CARNATIONS, and PICOTEES; catalogues of which may be had on prepaid application. 12 plants of named Auriculas, of different varieties, for 20*s.*, package included. 20 pairs of Carnations and Picotees, good named varieties, for 20*s.*, package included.

NEW SEEDLING AZALEAS AND CINERARIAS.

WM. IVERY, Florist, &c., Peckham, near London, begs to inform his Friends and the Public that he is ready to supply the undernamed Plants, which he can with confidence recommend.

Azalea lateritia formosa, bright red, 21*s* to 31*s.* 6*d.* each. "A Certificate of Merit was awarded to Mr. Jas. Ivery, of Betchworth, having large flowers, clean and bright in colour, and expanding freely."—Dr. Lindley *in Gard. Chron., May* 25.

Azalea coccinea superba, bright scarlet, good shape, and free bloomer, 15*s.* each; Azalea delicata, bright pink, good shape, and abundant bloomer, 15*s.* each.

Cinerarias.—Beauty of Wonham, very large white beautiful eye and dwarf habit, 5*s.*; tricolor, white and pink, brown eye, compact flower, 5*s.*; Nosegay, purplish blue, good petal, and noble truss, 5*s.*; Washington, very large crimson, good petal, 5*s* ; Captivation, white ground, with beautiful mazarine purple tips, gained first Prize at the West Kent June Exhibition, 5*s.*, Criterion, mazarine blue, beautiful white centre, gained first Prize at Dorking May Exhibition, 7*s.* 6*d.*; Red Rover, bright crimson, beautiful prolific bloomer, 5*s.*; Fanny Elsler, white crimson tips, prolific bloomer, 5*s.*; Pickwick, bright purple large flower, and fine shape, 3*s.* 6*d.*; Compacta, small, white, and beautiful round flower, 5*s.*

The whole set of Seedling Cinerarias, 2*l.* 5*s.*

The following Cinerarias can be recommended as good:—Ivery's Beauty of Syston, bronzy purplish blue, fine winter flowering var., 3*s.* 6*d.*; Emperor, 2*s.*; Pride of Peckham, 2*s.* 6*d.*; Regulata, 2*s.*; Delicata, 1*s.* 6*d.*; Regina Victoria, 2*s.* 6*d.*; Triumph, 2*s.*; Rival King, 1*s.*; Imperial Blue, 1*s.*; Royal Blue, 1*s.*; Iveryana, 1*s.* 6*d.*; Princess Royal, 1*s.* 6*d.*; Queen Victoria, 1*s.* 6*d.*; Exquisite, 3*s* 6*d.*; Wee Pet, 3*s.* 6*d.*; Henderon's Azurea, 1*s.* 6*d.*; Pilot, 1*s.* 6*d.*; Unique, 1*s.* 6*d.*; Magnet, 1*s.* 6*d.*; Prince of Oldenburgh, 3*s.* 6*d.*; Sombre Agreeable, 3*s.* 6*d.*; Eclipse, 1*s.* 6*d.*; No. 7, 1*s.* 6*d.*; Enchantress, 1*s* 6*d.*; Compact Blue, 1*s.* 6*d.*; Bell's Decora, 1*s.* 6*d.*; Good's Compacta, 3*s.* 6*d.*; Gaines's True Blue, 1*s* 6*d.*; Prince Albert, 1*s.* 6*d* ; May's Queen of May, 2*s.* 6*d.*; Youngii, 1*s.* 6*d.* Good varieties from 9*s.* to 12*s.* per doz. Fine Cineraria Seed, 2*s* 6*d.* to 5*s.* per packet.

Fine Petunia, noticed in "Calendar of Operations," *Gard. Chron*, Sept. 14. Ivery's Pet, 1*s.* 6*d.* to 2*s.* 6*d.*; Magna Charta, 1*s.* 6*d.* to 2*s.* 6*d.*; Reliance, 1*s.* 6*d.* to 2*s.* 6*d.*; Ovid, 1*s.* 6*d.*; Prince Albert, 1*s.* 6*d.* to 2*s.* 6*d.*; Kentish Beauty, 1*s.* 6*d.*; Enchantress, 1*s.*

WARREN'S GARDEN and NURSERY, Nonantum Vale, Brighton, Floral Saloon and Seed Store, No. 1, Tremont Temple (late Tremont Theatre), Boston.

The Proprietor of this Establishment is now ready to receive and execute orders for Fruit, Ornamental Trees, Grape Vines, Shrubbery, Roses, Strawberry Plants, &c., in any quantity, and of the most valuable kinds, at short notice, properly packed and secured for transportation to any part of the United States, Provinces, or Europe.

The Catalogue for 1844, which has been prepared with scrupulous care, contains a list of the choicest sorts of Pears, Apples, Plums, Cherries, Peaches, Apricots, and Nectarines, Grape Vines, Raspberries, Gooseberries, Strawberries, Currants, Evergreen Trees and Shrubs, Ornamental Trees, Herbaceous Plants, Roses, Greenhouse Plants, Dahlias, &c.

A new feature has been added in the Catalogue, which renders it particularly valuable for purchasers who are desirous of improving their orchards and grounds, by planting only the most approved, superior, and productive varieties. It is by columns and abbreviations, the meaning of which is explained under every different kind of fruit, so that a large number of the most important characters by which the different varieties are distinguished may be seen at a glance.

While the List of Fruits may not be found so extensive as in some other Catalogues, it contains every kind of value, and all new and improved varieties are added as soon as their qualities are tested. Nevertheless, any variety that may be ordered can always be supplied, on as reasonable terms as are afforded at other Nurseries.

The List of DAHLIAS comprises upwards of 300 of the choicest varieties of this gorgeous and splendid flower, most of them prize varieties. Dry Roots ready for delivery early in the Spring, and in Pots from the middle of April to the 1st of June.

STRAWBERRIES, of the most productive and best varieties, for sale, in any quantity. None but healthy and strong Plants will be suffered to leave the Nursery.

GRAFTS and SCIONS of most of the kinds named in the Catalogue, can be obtained in their season.

GREENHOUSE PLANTS of all the rare and splendid kinds always on hand at the Saloon, where visitors are respectfully invited to call.

GRAPE VINES, ASPARAGUS, and other roots constantly for sale.

Also, a great variety of choice GARDEN and FLOWER SEEDS, all of this year's growth, and warranted fresh, genuine, and true to their names.

Agricultural, Horticultural, and Botanical Books.

Gardening Implements, Flower Vases, &c. &c. The whole enumerated in a new descriptive Catalogue, which will be given Gratis on application. All orders for trees will be delivered at one day's notice. Every tree and plant will be warranted by the subscriber as to its distinctive character and goodness.

JAMES L. L. F. WARREN.

NEW HARDY IRISES.

SUTTON and SONS respectfully recommend attention to this beautiful tribe, and especially to the elegant and distinct varieties which they have of late years imported.

Sutton and Sons' Collection of Irises are equal to any in Europe, and they now offer as under:—

The Collection of 70 varieties	1*l.* 10*s.*
The most distinct 40 do.	0 15
The best 12 do.	0 6

The readers of the *Gardeners' Chronicle* are earnestly recommended to observe Messrs. Sutton's Priced List in the 2d page of the *Chronicle* of 28th September.

N.B.—Parcels delivered free to any of the railway and packet offices in London, or any station on the Great Western Railway within 65 miles of London.—Reading Nursery, Oct. 10.

GEO. MILLS offers Five Seeds of his best Early Frame CUCUMBER for 2*s.* 6*d.* His Treatise on their Culture, with Plan of Pit, is published, at 130, Fleet-street. G. M. will shortly publish, price 5*s.*, his System of Cultivating the Pine-apple. Also, his Opinion of the Tank System.

Gunnersbury Park, Acton.

ROSES.

T. RIVERS begs to inform his Friends that he has recently published his Rose Catalogue, No. 1 Edition, for 1844, and a Supplement containing the New Varieties of Roses, with a few Remarks and Directions for Culture.—Applications for the Catalogue, to be sent per post, inclosing a twopenny-stamp, and, for the Supplement, a penny-stamp, will be promptly attended to.—Sawbridgeworth, Herts, Oct. 10, 1844.

SPALDING'S PROLIFIC RED WHEAT. DUTCH ROOTS, &c.

J. and C. WHALLEY beg to inform their Friends that they have a large supply of the above very valuable Wheat, and having received the most flattering reports in its favour from several eminent Agriculturists who have grown it, they feel great confidence in recommending it as the best Red Wheat now grown, having during the last two seasons in a great many instances produced above 60 bushels per statute acre, this season many fields have yielded the enormous quantity of 8 quarters per acre; and where grown in competition with other sorts of Wheat, it has produced 8 to 12 bushels more per acre. Price 9*s.* 6*d.* per bushel.

J. and C. W. have also ITALIAN RYE-GRASS, imported direct by themselves, and which has given such great satisfaction the last year to their friends. New Winter Tares, Seed Rye, &c. &c.

A fine collection of Imported DUTCH ROOTS, priced Catalogues of which may be had on application.

A general assortment of AGRICULTURAL IMPLEMENTS, embracing every article of acknowledged merit as it appears.

St. George's Crescent, Liverpool.

DANECROFT NURSERY, STOWMARKET, SUFFOLK.—PETUNIAS, SEEDLING VERBENAS, DAHLIAS, &c.

S. GIRLING has much pleasure in announcing to his Friends and the Public generally, that he has been successful in adding to his already extensive collection of Verbenas some splendid Seedlings of the present year, which for colour, form, and size far surpass any Verbenas yet produced; in confirmation of which S. G. begs to refer the public to the following awards they have received, and reports that have been made of them, viz., an Extra Prize at the Ipswich Show in June, Stowmarket in July, Ipswich in September, Bury St. Edmunds, do., Stowmarket, do., and Chelmsford open Show; and favourably noticed by Dr. Lindley in the *Gardeners' Chronicle*, August 31, and in the *Gardeners' Gazette* by Mr. Glenny, August 31. Mr. Ayres also speaks of them in flattering terms in the *Gardeners' Chronicle*, Oct. 5, page 671; and in addition to the above testimonials they have been seen growing by many eminent Horticulturists and Amateurs, all of whom have considered them as very superior.

S. G. therefore offers them with full confidence of their giving general satisfaction.

	s.	*d.*
Alba Lutescens, sulphur-yellow, large, and sweet-scented	3	6
Alba Magna, the largest and best white out	3	6
*Blanda, rosy-blush of excellent form	3	6
*Gladiator, orange-scarlet, with deep yellow eye, fine	3	6
Lovely Rambler, grey-lilac, very large	3	6
Messenger, bright-purple, of fine shape	3	6
*Mulberry, bright-mulberry, quite new in colour and fine	3	6
Rose de Amour, bright-pink, with beautiful yellow eye, quite distinct, and the most attractive Verbena ever raised	5	0
*Rubescens, bright-ruby, large and well-formed	3	6
The Giant, silvery-lilac, the largest trussing Verbena known, some of the trusses measuring from 10 to 12 inches in circumference—the heads of this Verbena resemble in appearance a blue Hydrangea	5	0

N.B.—Those marked with an * will not be sent out till early in May; the others can be had after the 25th of October, and can be forwarded in tin boxes by post. The usual allowance to the Trade.

PETUNIAS.—S. Girling has likewise been successful in raising some Petunias of superior excellence. Twelve varieties, selected from about fifteen hundred seedlings, will be sent out as early as possible in the spring, far surpassing anything in that fine and beautiful class of plants. Nurserymen wishing to be appointed agents are requested to forward their names, which will be published in the *Chronicle* and *Gazette* before sending out. The usual allowance to the Trade. Advertisements with names and prices will shortly appear.

DAHLIAS.—S. Girling having purchased the entire stock of that beautiful Dahlia, Bourne's Marchioness of Ormond, the best light-tipped Dahlia of the season, similar but far superior to Bridesmaid in every respect, plants will be sent out early in May next, at 10*s* 6*d.* each. A few roots would be parted with, on the warranty of the party purchasing, for exportation only, and the party to whom sent giving a pledge not to send plants to England for sale. Nurserymen and dealers wishing to place this Dahlia in catalogue next season, will have their names published in good time before sending out, and the usual Trade allowance, where 12 Plants are ordered, and extra Plants to compensate for long carriage.

DAHLIA NONPAREIL.—S. G. has a few large and small ground roots of that beautiful and popular Dahlia to dispose of; the former at 30*s.*, the latter at 20*s.* each. From the limited number sent out in England last season of this Dahlia, it will be more in demand than any other Dahlia sent out last May. Parties wishing for roots had better send their orders early, as the stock, which is limited, will be sent out in rotation, as the orders are received; almost every other kind of Dahlia in cultivation, embracing nearly all the favourite varieties of this and former years, can be had in dry roots at moderate prices, warranted correct to name.

N.B. A respectable reference or ready money will be required from unknown correspondents.

Foreign Orders faithfully executed.

Danecroft Nursery, Stowmarket, Suffolk, October 10, 1844.

LARGE IRISH YEW.—If any person has a large Irish YEW, not less than seven feet high, to dispose of, a purchaser may be found by addressing Mr. Masters, Exotic Nursery Garden, Canterbury.

PRINCESS ALICE MAUDE, AND MYATT'S DEPTFORD PINE STRAWBERRIES.

HURST and M'MULLEN, 6, Leadenhall-street, London, beg to inform their friends that they have a few fine plants of the above celebrated kinds of Strawberries still remaining, at 25*s.* per 100. Also fine plants of Myatt's British Queen, do. at 6*s.* per 100; Araucaria imbricata, strong plants, 9 inches high, 5*l.* per 100. Their Catalogue of Dutch and Cape Bulbs can be had on application; it contains splendid collections of Ixias, Gladiolus, Scillas, &c. &c.

CINERARIA "SILVER QUEEN."

A. PAUL and SON, Nurserymen, &c., Cheshunt, Herts, beg to offer the above novel and beautiful Cineraria, which was exhibited at the Horticultural Society's Rooms in Regent-street, and awarded a certificate there.

"A singular and handsome seedling Cineraria, showing a disposition to quill, by the purple rays of the flower being drawn together for some distance from their bases, and thus forming a tube having a silvery appearance."—*Gardeners' Chronicle.*

"From Messrs. Paul and Son, of Cheshunt, a Cineraria, doubly quilled, of a lilac or beautiful and singular silvery appearance."—*Gardeners' Gazette.*

Strong Plants now ready, 5*s.* 6*d*, including package, or post free, 6*s.* An order on Waltham-cross post-office expected from unknown correspondents. The usual discount to the Trade when six plants are taken.

SUPERIOR STANDARD ROSES, 24*s.* to 30*s.* per Dozen. SUPERIOR DWARF ROSES, 12*s.* to 18*s.* ditto. A fine Stock of EVERGREENS to be sold cheap.—A. Paul and Son, Nurserymen, Cheshunt, Herts.

ROSES.—Strong plants and fine sorts delivered free of carriage to London.

N.B.—A Descriptive Catalogue of 800 Varieties may be had on application, inclosing two postage stamps.

THE TRUE FASTOLFF RASPBERRY.

YOUELL AND CO, beg to announce they will again be able to supply fine canes of the above truly excellent variety, unequalled for the size of its Fruit and richness of flavour; prices as follow:—

Packages containing 100 Canes	£2	0	0
Ditto ,, 50 ,,	1	1	0
Ditto ,, 25 ,,	0	12	0

Further particulars will appear in future Advertisements.

YOUELL and Co. feel it due to themselves to state that a spurious kind was offered for sale by other parties last season, under the title of "Fastolff Raspberry," the same having no pretensions to the genuine variety.

Great Yarmouth Nursery, Oct. 10, 1844.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 12, 1844.

MEETING FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Oct. 16	Microscopical	8 P.M.
SATURDAY, Oct. 26	Royal Botanic	4 P.M.

Is there half a dozen persons who ever looked into that most curious book, "A Philosophical Treatise of Husbandry and Gardening; being a New Method of Cultivating and Increasing all sorts of Trees, Shrubs, and Flowers. By G. A. Agricola, M.D., and Doctor in Philosophy at Ratisbon," of which an English translation appeared in 1721? We doubt it. And we presume that the few who have ever looked at it have closed it again with the conviction that it is an imposition from beginning to end. There are, however, things in that book which laid the foundation of the most recondite processes employed in the MULTIPLCATION OF PLANTS. Agricola may indeed be regarded, notwithstanding his lies and exaggerations, as the father of the art and mystery of propagation. He maintained that all plants may be multiplied by portions of every part of the stems, leaves, and roots.

"A query," he says, "was once proposed in an assembly, viz., *An detur modus artificialis universalis multiplicandi arbores et frutices distributivè sumptos?*—Whether there be such a thing as a universal way of multiplying trees and shrubs in a distributive sense? There was one who presently answered that such a thing might be reckoned among the *Non entia*, and was such another fiction as that of Bellerophon; but I hope I shall, through care and diligence, bring the matter so far as to convince those incredulous persons, not by words only, but by real experiments." And then he goes on to explain how such ends are to be attained.

His great panacea was what he called Vegetable Mummy, a mixture of gum copal, and Venice turpentine, into which the fragments to be operated on were to be plunged. And a hasty reader would suppose that this was all that Dr. Agricola relied upon. But the true principles of multiplication were well understood by him, and distinctly explained; his mummy was only an accessory in the operation. Take, for example, the following passages:—

"'Tis certain, from a great many experiments, that a yearly joint or shoot has in itself at the same time both root and branches; and, according as things are managed, it quickly produces either a twig or a root. To demonstrate this, I shall pitch upon an instance known to all country people and Vine-dressers; they take a long stalk or branch of Vine that has a great many joints, which they bend under ground, and it shoots a great number of roots on every side; now had they not bent that branch thus under ground, other new branches would have come out of its joints, which is not at all to be questioned; but if roots may grow from one shoot or branch, they may likewise grow from all, when skilfully prepared, as experience has shown, and new discoveries will confirm. Therefore what has been said of one shoot will be found true of all.

"It has been already demonstrated, that every tree is furnished with abundance of joints, in which lies the spring of life. You may take a branch with two or three joints, and cut off the wood at the bottom of each, according to art, which being done, you may dress and lay them under ground. But as there are on every branch above fifty or threescore joints, which may all be treated after this manner, it follows that the same method may be used with respect to all trees and shrubs, although they have a hundred thousand or a million of joints."

Here we have the main principles of propagating plants as plainly described as they could be at the present day. A more learned phraseology might be employed, but the meaning would be the same. In the course of a century we have not advanced a step, except that we *can* do without mummy what Agricola *says* he did with it.

It is certainly true that every joint of every plant will form a new plant, if placed in circumstances favourable to maintaining its vitality long enough to enable it to take root. The difficulty consists in knowing what those circumstances are, and how to insure their presence. An experienced propagator knows this—one without experience is ignorant of it. Both have the same rules and facts to guide them, but one cannot apply them and the other can. In one man's hands every cutting strikes; in another they all die. What one pronounces it impossible to propagate at all, another never fails with. Give Schykoffsky a willow *leaf* and he produces you a couple of plants; give Grumble a willow *branch* and he contrives to kill it.

The English, with all their skill as gardeners, are certainly not the most celebrated as propagators; for although we here and there find a first-rate hand among them, yet he forms the exception, and not the rule. We once knew a man who flattered himself that he was a capital gardener because he grew Grapes pretty well; and yet, when [illegible] Pine-tree was [illegible] given him, the only notion he had of obtaining any live thing from it was to sow it whole as he received it. This honest man might be a Grape-grower, but he was no gardener. It is true that he wore a blue apron, and talked much *about himself* at village meetings, but the unlucky Pine-cone showed him up. When the ass put on the lion's skin, he would have passed as the very monarch of the forest if his braying had not betrayed him.

Now the science of propagation is one of the finest parts of gardening. It is the most pregnant with useful consequences, and it is the surest test of real knowledge of the profession. The man who can propagate well cannot cultivate ill. If he knows enough to do the one well, he knows too much to do the other ill. We should therefore set down dexterous propagation as one of the best practical evidences of what a gardener is good for. It is for this reason that it seems worth while to point out, as far as we have the means of doing so on paper, the views of the best modern gardeners upon this important subject; for which purpose we shall next week offer some remarks upon the recent pamphlet by Mr. Neumann, "Upon the Art of making Cuttings."

ON THE GROWTH OF FOREIGN PINES IN MORAYSHIRE.

Of the various species of Coniferæ which have been introduced into this district during the last twenty years there are none that advance so satisfactorily, or promise to become such valuable timber-trees, as those indigenous to the mountains of India—namely, Abies deodara, Pinus excelsa, and Abies Smithiana or Khutrow. These are not only of rapid growth, but they ripen their shoots so as to withstand our severest winters, and as yet, appear less liable to disease than many other Pines recently brought under our notice. The Abies Douglasii and the Pinus ponderosa, from the banks of the Columbia, are both of luxuriant growth, but are not adapted to our climate. The former has a propensity to produce autumnal growths, which, from their succulent state, are not fitted to resist severe frost, and appears to partake considerably of the nature of the Picea balsamea, a tree less tenacious of life than any other Fir. All our finest specimens of Pinus ponderosa have become victims of the small but destructive beetle, Hylurgus piniperda, and the tree is neither likely to become valuable nor ornamental. Many of the other species of Foreign Pines are either too tender or of too slow growth in this climate, and in exposed situations are not expected ever to exceed the size of tall shrubs. It is true that the more rare and expensive sorts are not unfrequently disfigured and retarded in growth, by being long confined in garden-pots before being placed permanently in the open ground—treatment which, at first, is apt to conceal the merits of the plants. It is, however, necessary to keep some kinds in pots, to insure their being removed of a certain size with safety; for instance, the Pinus maritima, and all of the same habit of growth, do not transplant and succeed well if allowed to remain more than one year in the seed-bed; that their roots may therefore be preserved in a fit state for removal they must be transplanted frequently, or kept in pots until they be placed in their final destination. This mode of treatment, however, is not necessary for the kinds we recommend from the Himalayas—their roots being very fibrous, or bushy, adapt them for being removed at almost any age when planted; and they may be successfully grown from seed by the nursery treatment suitable for the Larch and Scotch Fir. Those that we have seen kept long in pots become stinted, but the vigour which the plants assume when their roots are set at freedom in the open ground after being cramped and restrained in garden-pots is very remarkable. My remarks on the native Pines of India are not founded merely on the success of a few nursed specimens, grown under circumstances unusually favourable. Plants have been raised here in great numbers, and many have been transplanted among the brown Heath on the acclivities of some of the hills in the highest parts of the county. Perhaps the landowners of no district in Britain are better furnished with the Pines of India than are those of Morayshire—thanks to our townsman, Dr. Falconer, who collected and forwarded the seeds of the plants, which advanced so hopefully. Seeds of the Deodara presented by him are being grown to decorate the promenades on the Cluny hills in the vicinity of Forres, and the property of the town. The introduction and extensive propagation of trees that are really valuable, possesses an interest and advantage far beyond that which is local. These form a foundation of national wealth and independence, and become a source of individual prosperity and riches. The Deodar is said to be the most celebrated coniferous tree of the Himalayas; it attains the height of 150 feet, with a trunk 30 feet in circumference, or even more, and in its native country rarely falls short of these dimensions. Its wood is very compact resinous, and fragrant, capable of receiving so very high a polish that it has been compared to brown agate, and it has been found perfectly sound in the roofs of temples in India which could not have stood less than 200 years. The average yearly growth of the plant four or five years old in Morayshire, is from 10 to 12 inches; the feathery lightness of its spreading branches, and the beautiful silvery hue of its leaves, render it even when young extremely ornamental; and all travellers who have [illegible] the tree full-grown in its native [illegible] unites an extraordinary degree of majesty and grandeur with its beauty.—*J. Grigor, Forres Nurseries.*

THE NEAPOLITAN VIOLET.

THIS is one of our loveliest winter flowers, if rightly managed, but this I fear is seldom the case; and the failures which take place are, I apprehend, chiefly through acts of overkindness. Forcing, in the strict sense of the word, will by no means agree with them, more especially by bottom-heat in the dead of winter: and this, for two important reasons: 1st, they are impatient of any given temperature above 50°, in the comparative absence of light which we experience through November and December; and 2d, because they are equally impatient of dampness of atmosphere, and this must of course occur if there be any matter beneath them in a state of fermentation unconfined.

I planted a four-light pit with them in the first week of September; this pit had been a receptacle for Pines through the summer, and was of course nearly exhausted: having trod it firm and filled it as high as would cause the Violet leaves to come within an inch of the glass, I placed thereon an inch of the richest old rotten manure in the yard; on this the violets were placed, with all the ball of earth that could be made to adhere to them, and then filled up with a compost of one half sandy heath soil in a mellow state, and the other half the top of an old Cucumber bed, which had been soiled with stiff yellow loam. The bottom-heat of this bed has descended gradually from 75° to 68° up to this time, and in another fortnight will be down to 60°; in the meantime I have kept the atmospheric heat as low as possible, by giving abundance of air all night; so that I will venture to say that the bottom-heat has averaged at least 12° more than the atmospheric heat. My plants now look splendidly, and I make no doubt will fully answer my expectations, as I am always successful with this flower. I put heath soil about them for the same reason that early Cucumber growers use it, viz., as being dryer and mellower on the surface, and somewhat antiseptic. These plants are peculiarly liable to a rottenness in the leaf, which is, no doubt, contagious, for if not picked off it spreads like wildfire, and after picking I invariably dredge a mixture composed of very coarse river sand over them, with which a little charcoal dust and quick lime has been blended. This dressing also prevents the slugs from committing their ravages, for if permitted they will constantly deface the blossoms.

Another precautionary measure is, to take care that the soil, at planting, is of an equal moisture throughout, as but little water can be used after planting, without producing too moist an atmosphere. I have up to this time used nothing but the syringe, except at planting-time, when I watered them freely to settle the soil. They must have all the air that can possibly be given with safety, both night and day; taking care at all times to exclude even the slightest degree of frost; double matting in winter, with plenty of dry Wheat straw thrown over the mats in weather of great severity, will be found sufficient for this purpose, provided the sides of the pit be completely cased with dead lining up to the lights.

The main principle to bear in mind is, the endeavour to lengthen as it were our summer, by the bottom-heat, at planting; the very discrepancy between the bottom-heat at this time, and the atmosphere, combined with the temporary check on removal, induces the blooming habit very shortly; after which the mere exclusion of frost will insure a continual production of blossoms until May of the following year.—*Robert Errington.*

DISEASES OF PLANTS.—No. IV.

[FUNGI.]

WE now come to the second great class of Fungi, viz., that in which the reproductive bodies are contained in sacs, whether they be solitary, or arranged according to some definite plan. To this belong the tribe of Helvellas and Pezizas, amongst which the common morel, or the large dunghill Peziza will at once occur to every cultivator who has taken pains to examine the structure of such species, which do not indeed require a very high magnifying power. With these are associated many subterranean forms, such as the edible Truffles, a portion of the hypogæous Fungi being more nearly allied to the puffballs. The curious Fungus, too, which grows on the hoofs and horns of animals, or upon feathers, though so closely resembling one of the small Lycoperdons, must take its place in this division. Then comes the enormous genus Sphæria, more numerous, perhaps, even than the Agarics, a familiar example of which is afforded by the Sphæria hypoxylon, which grows at the bottom of old stakes, &c., resembling the snuff of a candle. And of these also there is a small but highly interesting subterranean group, of which one or two species have been detected in this country. To this division also belong the Fungi which produce the white mildews on Peas and Roses, and that which is sometimes so destructive in Hop-grounds; and lastly, that portion of the moulds which produce their reproductive bodies within distinct sacs, or as they are called, sporangia. As stated above, the true affinities of several genera are not at present

ascertained, and preconceived notions and habits, in spite of better information, will still keep others in very improper situations. Into these questions, however, it will not be necessary to enter, at any rate for the present.

We must now say a few words on a very important constituent part of Fungi, to which attention has not always been paid—I mean that part known under the name of Spawn, or Mycelium, which produces the fruit. In general, the portion of the Fungus which appears externally, and to the casual eye, the whole Fungus, is the fruit—a fact which has given rise to the notion that Fungi consist entirely of fructification, and has caused them to be compared with such phenogamous plants, which indeed are perfectly analogous, as Hydnora and Rafflesia. But this portion often exists, even for years, without producing fruit, and either in its normal state, or one of excessive luxuriance, gives rise to various supposed genera, which, as they are destitute of fruit, and are mere states of transition, or what have been called anamorphoses (that is, over-luxuriant but incomplete conditions) of higher species, will be studiously excluded from systematic arrangements by every philosophic botanist, though they are far from being devoid of interest in other points of view. And even where the fruit has been fully formed and passed through its several stages from the first bud to ultimate decay, the mycelium itself remains to produce again, so soon as circumstances favour the peculiar combination of atmospheric phenomena necessary for their development, a fresh crop of fruit. It is thus that the largest trees are infested for years with incipient Fungi, without any outward sign of their existence, till unexpectedly the pileus or fruit bursts forth, and the work of destruction is certain and speedy. It is the mycelium which constitutes what is called Mushroom spawn; and the fungous stones of Italy which, when watered, produce at pleasure a crop of edible Fungi. It is this again which in the entophyllous* Fungi traverses the cells (as represented in the accompanying sketch), waiting only fit proportions of heat and moisture to make their appearance, to the detriment of our harvest. I am not aware that the subject has at present been properly investigated, but there can be little doubt that the dark-coloured plants of corn, which may be pronounced beforehand as certain to be attacked in due time by their peculiar parasites, would, if examined as soon as this appearance is manifested, show evident indications of the lurking mycelium. At a later stage of growth, when the enemy is merely waiting for a happy moment in which to declare himself, the observation of the mycelium is easy enough.

Puccinia graminis (common mildew), with its mycelium penetrating the subjacent cells; from Corda.

I have not attempted to give any definition of the term Fungi. In bodies of such various forms and habits, it is almost impossible to give a faultless definition; and however easy it is to criticise, it is very difficult to improve. Indeed some Fungi and Lichens approach so near to each other, not only in outward appearance but in structure, that it is merely the practised eye which can determine accurately to which tribe certain individuals ought justly to be referred. In following up the subject I shall first dispose of those productions which, though classed with Fungi, have really no title to be so, but are mere diseases of the cellular tissue of the plants on which they are produced.—*M. J. B.*

THE ROSE-GARDEN.—No. XIX.

(*Continued from page 620.*)

Grafting.—Where buds have failed, or a good choice of scions be attainable in February, from plants which require pruning, let the produce of each tree be examined after cutting it in, which must in this instance be commenced two or three weeks before the usual time; a selection may then be made of those which are the finest, and their thickest ends (care being taken that the produce of each tree be tied in a separate bundle and ticketed) placed in a lump of moist clay an inch deep; the clay must then be pinched tight round them, and the whole placed in a potful of earth (above two-thirds of the shoot being left free) until ready for use. It must be remembered that at the end of each shoot there will probably be one or more buds open; these must be carefully cut off from the shoot, or they will infallibly exhaust the others.

The exact time for removing the scions from the parent tree, must depend upon the season. Some time during the first three weeks in February is the usual period. There does not exist an actual necessity for cutting the scions until they are required for use, but then it will be more difficult to select the number required in a state fit for use, and there is a greater chance of their going off, if the weather remain cold, or the sap be not immediately supplied. Scions cut when the sap is quite down, carry better and are in every way more hardy; and such failures as may take place occur before they are used, the weaker ones shrinking whilst laid by, leaving those which are desirable to use fresh and vigorous.

Opening buds to be cut off and thrown away previous to the insertion of the scions in the clay.

Piece of scion placed in the clay to be cut off at the time of grafting.

Let the shoots remain for three weeks in an outhouse, or any other place, neither very dry nor very damp, where neither wind nor sun can come in contact with them; the clay being damped with a sparing hand, if the generality of the scions appear to shrink. During the first week in March the head of the stock (in which the sap should be beginning to rise), is to be cut off horizontally; a slit made in it, straight downwards, of a couple of inches, or an inch and a half long, without injuring the sides of the bark. The scion is to be taken in the left hand, three buds, or two if the stock be not large, being left upon it; the lower extremity must then be cut in the shape of a wedge, the back being rather the thinnest, and the lowest bud about half an inch above the thick end of the wedge. In doing which, care must be taken that the bark be undisturbed; and each scion so placed that when entered in the stock all the buds may point outwards, or, at any rate, be in such position that the shoots from them may not interfere with each other. The end of a budding-knife, or a little wooden or ivory wedge, may be used to open the slit in the stock on one side, and the scion, with the thickest part, or front outwards, must be placed in the other, care being taken that the edge of the inner bark or liber of the scion touches the edges of the inner bark of the stock, all the way down; the wedge may then be removed, another scion entered in its place, the slit being kept open by the first; if the size of the scion be only half the size of the stock, a shoulder may be left to the former, and the chances of success thereby increased. Any number of scions may be inserted in the same stock, but from one to four at most are all that are desirable in the present case, to cover completely the head of the stock, which is apt to receive much injury from the weather, if not carefully attended to. The object of laying by the scions, is that the stock may be the forwardest, and be enabled to supply the sap, and force them forward at once, instead of lingering while they perish from exposure and want of nourishment. But there is this advantage in claying and laying by scions; viz. the separation of the vigorous from those which are weakly, which latter will sometimes shrivel and go off long before they are wanted, leaving their neighbours sound and healthy; this declension, however, may frequently be ascribed to a deficiency of moisture, from the clay having been permitted to get too dry. When the shoots are on, the whole must be tied up with a bast ligature, to prevent the scions from shifting, which from their wedge-like shape they will have a tendency to do, when the rise of the sap swells the stock, thereby diminishing the juxtaposition of their respective libers, and the whole beneath the lowest bud covered with grafting clay, totally excluding air, sun, and rain. If the clay crack it must be renewed, not by shifting, but by filling up the crack. In about six months the clay may be removed, and the wound covered with mixture; this latter on no account must be omitted.

Home Correspondence.

Planting Pines in Tan.—One of the greatest misfortunes of almost all horticultural discussions is the want of the disputants being just to each other, as we are too frequently more desirous of obtaining a personal triumph, than of yielding to the triumph of truth. From Mr. Hamilton's reply to my remarks on the above subject, a stranger would suppose that I had passed unmeasured censure upon his whole work, whereas I have merely expressed my doubts, and doubts warranted by experience, as to the propriety of adopting one part of the practice which it inculcates. For venturing to do this, Mr. H., instead of commiserating my misfortunes, lays all the fault to my having used a small quantity of half decomposed leaves with the tan. He also misquotes my article, and makes me say that which is not to be found in it. Thus I am represented to have used "three parts of decomposed leaves" (I wish I had done so), "to one of tan;" whereas I never mentioned the proportion in which they were used at all; and I may now state that not more than one-eighth of the mass consisted of leaves, and this indeed was only used for the fruiting plants, while the succession ones were planted in what Mr. H. is pleased to designate "pine tan." In truth, admitting the use of tan at all, so suitable did the material appear that I have not the least doubt if Mr. H. had passed by at the time we were using it, he would have said, "You could not make use of a finer article." However, in both cases the experiment is a failure; the fruiting plants were irreclaimable, and have been thrown away some time ago; the succession plants began to improve as the tan decayed, but they rooted so reluctantly into it that I determined to remove them, and they have been growing in soil for some weeks past. In taking them up, it was very evident that tan, at least such as I get near the Metropolis, is not suited for the growth of Pine plants. Very few of the roots had extended beyond a few inches from the ball of earth which adhered to the roots at the time of turning out the plants, and these roots had a stinted and very unhealthy appearance; but, strange to say, the ball of earth was a mass of fibres as fine as the roots of Heaths, and on examination I find these are now progressing freely into the fresh compost which surrounds them. Nothing could more satisfactorily demonstrate the inutility of tan as a medium for Pine plants to grow in than the great difference that was observable between the plants above adverted to and those growing in compost in the same pit. In the tan they were disgraceful, and I should have been ashamed to have shown them; only, being planted in a great measure for experiment, I was desirous of showing my friends that the experiment was a failure. Those planted in soil grew as luxuriantly as could be desired, the roots ramifying through the soil in every direction, and many of them were as thick as the pen with which I am writing. Now, judging from this experiment, Mr. Hamilton is surely mistaken in supposing that a small quantity of leaves mixed with tan would injure it. If Pines will grow in tan, which posesses no fertilising properties, as is proved by the analyses of Sprengel and other chemists, they will grow much better by an admixture of leaf-mould with the tan, which is known to contain most of the essential elements of vegetable organism; indeed, one of the most successful Pine-growers in the country, viz., Mr. Malleson, of Claremont, fruits all his plants in half-decomposed leaves, and few persons grow Queen Pines, as a general crop, in better style. We have also the evidence of Mr. Fleming, of Trentham, to the same effect. Mr. Rushton is surely mistaken in his notions regarding the fertility of tan: the very fact of his Fig having produced so great a mass of roots in it, proves that it was not rich in nutriment, or why did Nature provide so many mouths (roots), with which to feed the plant? All experience proves that when plants are growing in poor soil, they make a greater quantity of roots than when growing upon a dunghill; and hence the propriety of using sand in propagating, and of picking out plants intended for transplanting on light sandy soil. This is a law of nature, and therefore immutable. I doubt not but Mr. H. has been successful with the tan of his neighbourhood, but he must recollect that the curing of hides differs so much in different tan-yards, that what may be suitable for plant culture in one place, in another may be poisonous to them; and therefore, as we have no means of ascertaining the purity of tan, it will be better to abandon its use altogether, and use a proper compost, than run the risk of injuring plants by using an improper material. From Mr. H.'s letter, and also from the concluding sentence on Pine culture in his Treatise, we have strong presumptive evidence of his having some misgivings himself as to the propriety of using tan; for in the former he says, "The most of my fruiting plants are growing in a mixture chiefly composed of soil similar to that recommended in my Treatise, and such as I will always recommend where the tank system is used." At page 103 of his Treatise he says, "When a congenial bottom-heat can be communicated independently of fermenting materials, why not use a proper compost? And for this purpose I would recommend nothing but broken bricks and fresh sods, roughly chopped, of equal quantities, which will keep the bed in a porous state, and allow the atmosphere to have free access to every part of the compost. Although this plant will grow quicker in fresh tan than in compost, yet when the deficiency of bottom-heat is obviated by the improved system of communicating that agency, such as tanks, hot-water flues, &c., we may naturally expect the fruit to be larger than when grown in the latter compost." This quotation affords pretty conclusive evidence of Mr. H.'s misgivings as to the excellence of his favourite compost.—*Judex.*

Cabul Melons.—As many people may be led to suppose, from an advertisement by Mr. Cuthill, which has appeared in the *Chronicle* lately, that I lay claim to the merit of introducing or first growing the Cabul Melon, I beg to say, that the Cabul Melon grown here was raised from seeds that were given to me; that it is the same sort which is grown in many other places; that I have not distributed any seed; and that I never heard of such a Melon as "Fleming's Trentham Cabul Melon," until, to my great surprise, at p. 649, I saw it advertised.—*G. Fleming, Trentham Gardens.*

Rose Catalogues.—The reading the remarks of "Philalethes" on Rose-Growers' Catalogues, p. 669, led me to compare them. I find much that appears irreconcilable. But if inaccuracy of names is admitted to be

* Growing inside of leaves.

unavoidable, surely inaccuracy of colours—if inaccuracy it be—there is far greater excuse for. In relation to Mr. Paul's "Observations on the Cultivation of Roses in Pots," where, at p. 28, Niphetos is described as snowy white, and at p. 31 lemon; I find in the first instance it is described as a forced Rose, and as such it is actually white. If "Philalethes" looks to the work in question, p. 28, a few lines lower down, he will find this sentence: "The colours of Roses are much altered by forcing, coming much paler, especially if a great degree of heat be maintained." This to me accounts for the seeming incongruity; for Niphetos has a lemon appearance when blooming naturally. The omission of Lamarque in Mr. Rivers's list of 20 Noisettes, was more probably owing to its tenderness than an oversight. I consider that every allowance ought to be made in favour of Rose Catalogues, which are circulated gratis, and which, it must be admitted, are of great service to all lovers of Roses.—*Philo Justitia.*

Toads.—About four years ago I brought from Jersey a large toad, which I keep in a small frame. It is very fond of insects, and one day this summer one of my servants gave it about 50 of the small brown beetles which are to be found on the Yellow Briar. It rarely, if ever, strikes at an object with its tongue, unless it be moving, and seems to project its tongue about an inch or inch and a half. A few days since, seeing some wasps eating some fruit lying on the ground, I fetched the toad and placed him near them. He soon caught sight of them, and ate several, and they seemed not to have the power of stinging him. The largest insect I ever saw him eat was a cockchaffer. Toads seem particularly fond of woodlice, and I have induced a small English toad to eat a white butterfly: in this case it had to make use of its claws to push the wings into its mouth. I have noticed this small toad keep its mouth open for some time after having eaten some wasps, and almost thought that they had contrived to sting him, but he soon was able to eat another wasp, and afterwards appeared none the worse.—*T. O'Reilly.*

Strawberries, &c.—Mr. Bree says, (p. 621) "that a three-year-old Strawberry-bed will produce more fruit than a two-year-old bed. I have tried the experiment upon two beds: from the three-year-old bed I cut off all the leaves; but be it understood I did not destroy any of that year's runners, for I consider that they are of more value than the old stools, many of which, when raking off the leaves, I destroy, in order to give the runners a better chance. When the leaves were cleared away the bed was well manured; and from this bed I obtained as many Strawberries as I gathered from the one-year-old bed, from which I only cut off the runners, and which was, at the same time, also well manured. The reason I assign for having as much fruit from the four-year-old bed as from that which was only two years old, is my letting that year's runners remain. The beds were dressed late in the autumn. From experience I can say that the Strawberry cannot be cultivated with advantage more than three years on the same piece of ground; I have always found that the one and two-year-old beds produce by far the best Strawberries. This is not my opinion only, but it is also that of some of the best cultivators of this valuable fruit. With regard to the application of salt to Asparagus, the Editor says "to put it on after the haulm is cut, is to pickle, and not to manure." Surely Mr. Bree does not imagine that I remove the soil down to the crown of the roots in spring before I apply the salt. If so, he is mistaken; it is put on the surface of the beds, and without injury to the young shoot.—*Villagius.* [In order to put an end to the discussion about the age at which Strawberry-beds cease to be productive, it is as well to say at once that that depends entirely on the soil. We could point to beds of the Old Pine Strawberry in Hertfordshire, which, when 20 years old, bore as well as when 2 years old.]——*H. A. Wood, Statfold Hall,* says, "I quite agree with the statement made by Mr. Bree (page 621), viz., 'that cutting off the leaves of Strawberries is an unscientific system.' It deprives the plants of their respiratory organs. If science is correct, in the economy of Nature leaves have a peculiar function to perform, viz., elaboration of the sap. It is admitted that the embryo fruit-buds are formed at the expense of the elaborated sap; if so, should we not encourage as much as possible this beautiful process of Nature, and reasonably consider that the more elaborated sap there is, the better: the question then is, How is this to be obtained? Theory would answer, by retaining the foliage entire. If the leaves are mowed off after the fruit is gathered, a considerable portion of time elapses before the plants will have renewed their foliage; during this period I consider that the plants are losing time, which is most important, as many bright suns will have passed away before elaboration is again in active operation. The time lost may perchance sometimes be regained in the case of a dry and cloudless autumn; but in a wet and cloudy season, a very different result must be expected. On the other hand, by retaining the foliage entire, we embrace all the advantages that summer and autumn offer. Unless leaves were of important service, Nature would not have bestowed them; it is inconsistent to take them away, and at the same time presume to be assisting Nature in perfecting her works. Plants are composed of several distinct parts, each part having its own office to perform; these parts co-operate with each other, and form a compact whole. If we take away one of them the whole is broken, and disorganisation is the consequence; in fact, mowing off the leaves of Strawberries is against the general practice of gardening; for in the cultivation of either fruits or vegetables, we certainly feel disconcerted if the foliage is in an unhealthy state. Witness the attack of insects if they are permitted to reign. What is the result? Death, or a severe injury ensues; and why? because the lungs are diseased, and this checks the system. How much greater, then, must the check be if we remove the lungs of the plants entirely! "J. H." very lately (page 638), after stating that he mowed the leaves off every other bed, says—'During this season there was no difference between the crop on the beds that had not been touched, and that on those which had had the leaves mowed off.' This plainly shows that with a favourable season such as last autumn was, there was no advantage gained by mowing off the leaves; and I attribute their being equal to those beds that were not touched, entirely to the favourableness of the season. Having thus a chance to make up for lost time, I may add that there are great odds against mowing off leaves: my practice is not to cut them off."

Strawberries.—From having followed the plan of never cutting the leaves from the Strawberry plants, and only slightly forking the beds, without injury to the roots of the plants, and giving a good coating of compost manure to the beds, before the winter sets in with its severity, my beds at this moment exhibit luxuriant blossoms, and supply my table with three or four different kinds of Strawberries, and may do so for another fortnight, provided this fine warm autumnal weather should last so long.—*B. D. Greys.*

Packing Seeds for India.—As inquiries are occasionally made respecting the best mode of packing and sending seeds to India, perhaps the following statement may be of use in showing with how little care seeds may be transported from one country to the other, without injury to their vegetative powers, provided they be previously in a fit condition, *i. e.* in a ripened and well dried state before despatching them:—Leaving India unexpectedly in the spring of 1840, I happened to have some seeds, which had been gathered chiefly in the month of November of the preceding year, without the remotest thought or intention of sending them to England, and they were put up in paper packets, inclosed in a paper wrapper, and kept in a common travelling box with other articles of personal use. As I came home by the overland route, some things not convenient for carriage were left to be forwarded by a sailing vessel, and amongst them the box with the seeds in it. The boxes, I suppose, were placed in the hold of the vessel with the rest of the cargo. The ship arrived in England in November, but I did not get them till February 1841. Most of the seeds were given away; but having a small portion of some of them left, I sowed three kinds in pots both last year and this, giving them no further artificial aid than the protection of glass, with a southern exposure. Those of last year vegetated and grew freely; this year one sort germinated and just came to the surface and died off; the other two have grown freely. Thus, notwithstanding it is now approaching five years since these seeds were gathered, and no particular care has been taken of them at any time, being kept in the paper packets they were originally put into, and the box that contained them must have been six months in the close hold of a ship, they have hitherto retained their vegetative powers little impaired. I attribute this partly to their being perfectly ripened, which indeed they could scarcely have failed of being, in the driest season of the Indian climate; but also and more particularly to their being well dried by the slow and sustained action of a very dry atmosphere during the six months they were in India, *i. e.* from November to May, the driest portion of the year. Hence I deduce as a practical corollary, that if seeds intended for India were kept for some time after ripening in a stove-heated room, the atmosphere of which must necessarily be in an arid state, it would be of little consequence how they are packed and sent to India.—*J. H. H.*

Salt for Fruit-trees.—I have, on a lawn, a large handsome Bigarreau Cherry-tree, which blossomed and fruited, and then dropped. I cut from the turf a triangular six-inch trench round it, 6 feet from its trunk, half filled it with salt, and put the turf on again. I have had noble crops ever since (seven years), but it makes little or no wood.—*Anon.*

Destruction of Small Birds.—I have observed from time to time in the *Chronicle*, remarks on the relative merits and demerits of those generally-despised birds—house-sparrows. I would mention that in some parts of the country it is still usual to set a price upon their heads; which, of course, has the effect of diminishing their numbers very considerably. This, it is said, is politic; and in the winter season it may be so; though to me it appears unnecessarily cruel. When, however, this onslaught is carried on in the spring, and still later in the season, I can tell Messieurs the farmers, and market-gardeners, that they are doing themselves a serious injury, for the quantity of insects and small vermin that these birds consume is positively incalculable. They are to the farmer in the fields, and to the gardener in the orchards, precisely what the scavangers are to the streets of London in sloppy weather. It becomes, therefore, a consideration of £ *s. d.* as to their preservation or destruction. My own observation, though I am no farmer, is in favour of the former; for I confess myself a debtor to the numerous sparrows domesticated in my neighbourhood for many essential services rendered. During the spring they cleared my Gooseberry and Currant-trees most effectively from caterpillars and the green-fly, and I also watched narrowly their active operations on the Rose and other trees of the garden, whose insects they swallowed in multitudes. Some will doubtless smile, when I tell them further, that sparrows are, when properly taught, admirable SONG-birds! Taken when callow (this is indispensable), from the nest, and brought up under a canary in fine voice, they have been known not only to equal, but even to surpass their masters in brilliancy of execution. I am well versed in these matters, having made them the subject of deep study for many years. In conclusion I would add, that I number the sparrows among my good friends.—*William Kidd, New Road, Hammersmith.*——It is not difficult for individuals to decide upon which species of bird or animal they may wish to be extirpated; this, however, cannot be taken as a rule to guide others, either in the protection or destruction of the feathered tribe. As an amateur gardener, I must confess I am rather inclined to the Waterton doctrine of allowing all birds to exist undisturbed; but I have no doubt my neighbour, the market-gardener, differs in opinion with me, and justly so, he having to gain his livelihood by his exertions. I have to preserve my health and gratify my senses by the same occupation. I would willingly give the best half of the fruit of my garden to our songsters, in return for their cheerful notes, and I would not even deny a small share to the impudent sparrow, considering the number of insects and grubs he exterminates during the year. Yet I can scarcely expect the poor man to do the same, when the produce of his patch of ground has to be converted into bread. The result of my labour is luxury—his necessary food. The mischief occasioned by hard-billed birds, viz. sparrows, finches, &c. &c., is great where they are permitted to increase without interference; and, on the other hand, their extinction would be attended with serious consequences. We kill every description of hawk which comes within our reach; we must therefore take upon ourselves their natural occupation, and endeavour to keep the smaller fry in order, by limiting their numbers without sweeping them from the face of the earth. The middle course is recommended—so difficult to practise, prejudice rising up on one side, and enthusiasm on the other. When the Wheat is ripe, a foray made by a large flock of sparrows is a serious matter to the farmer, and a person who has not witnessed their voracity would not credit the quantity they can in a short time swallow, leaving many hundreds of stalks without a grain in their heads. Although it is an incontrovertible fact that, in masses, sparrows, &c. are decided enemies, yet, in smaller bands they are useful allies. The soft-billed birds, those living principally on insects (sometimes plundering a little fruit), and visiting our gardens in spring and autumn, are birds of passage, coming to this country for the breeding season, and leaving us again as the winter approaches. These little strangers should be left to the chances of travel, which will sufficiently thin their ranks without the assistance of powder and shot; and even were they more numerous than they are, I look upon them as indefatigable labourers in the vineyard, well earning fifty-fold more than they eat. I believe the fruit is often knocked off when in search of the maggot, and not for the purpose of being devoured. Under the above class come fly-catchers, warblers, &c. &c. I have left the rook till the last. He is in the field what the sparrow, &c., are in the garden—an admirable aid in agriculture, but a sly rascal, and requiring to be well looked after, and not permitted to have exactly his own opinion on the subject of the increase of his family, manner of feeding, &c. Do not exclude him from a moderate share of the good things, in lieu of work done; but, as in the case of the sparrow, he must be under control. The rook's appetite is most accommodating, and not easily satisfied as to quantity; nothing comes amiss to him when hungry, and he cannot be said to be exempt from the charge of wanton mischief. However, under all circumstances, *Corvus Frugilegus* is a good fellow when under discipline, but leave him to his own inventions, and he is a sad scamp, having no sort of regard for private property.—*Falcon.*——*An Old Subscriber* writes, "I do not think that those who object to shooting birds can have been so much annoyed as I have been. My Strawberries, Peas, Cherries, Currants, Gooseberries, Peaches, and now Grapes, have been this year most voraciously attacked by them, and nets have no terrors for them. They are now, by some means I cannot account for, devouring a late crop of Peas most carefully netted. I was once a friend to birds, but now I do not know what to say."

Canaries.—I have some valuable Canary birds, 30 or 40 in number, but I am so troubled with mice, that I fear I must resort to that old-fashioned remedy for such pests—a cat. I fear puss might catch birds as well as mice, and should be obliged if any of your correspondents could devise any other means for ridding my house of such rapacious vermin.—*Nemo.*

Salt for Asparagus.—I have found the greatest advantage from using this for Asparagus, applied in November. My beds, which were worn out, are rapidly improving. I adopted the old-fashioned custom last year of sowing seeds in the old bed, when I sowed on the salt; the plants came up vigorously. I have dressed once with salt this summer, and I propose using no more this year; but I intend to apply good rotten vegetable manure instead.—*An Old Subscriber.*

Morphology.—It may not have occurred either to those who have propagated Gloxinias, Achimenes, or indeed any Gesneraceous plant, by means of its leaves, or to those who may have witnessed this mode of propagation, that it is a powerful argument in support of Morphology; and not being limited to Gesneraceæ, but admitting of very extensive application, its force as an argument becomes proportionably increased, in consequence of its being the farther removed from what might seem to be an exception to the general rule. It may be remarked, too, that several of the Achimenes, and A.

pedunculata especially, should be regarded as plants of very suspicious character by the opponents of this doctrine; for in several cases during the past season it has been observed that this A. pedunculata has produced scarcely any flowers, but in their usual position abundance of little scaly bulbs have been protruded; here, what should have been flowers, have been developed as bulbs. As far as I have observed, this has been the case to a much greater extent with plants which have been exposed to a considerable degree of cold—such as being placed in an open airy greenhouse—than with such as have been kept in a stove, where the air has been daily warmed; and also has been more apparent in the case of plants that have been grown in considerable and compact masses of soil, than with such as have been supplied with a more open medium, according better with the natural habit of the plant. The conclusion which may be drawn from this circumstance seems to be, that in consequence of the roots being placed in soil of an unsuitable kind, and in circumstances unfavourable to the proper and regular development of the several parts of the plants, the latter become induced to make a strong effort for their perpetuation, which might seem to be endangered; and, under these circumstances, myriads of latent germs are put forth instead of the more fully organised particles, which would have been formed had the flowers been produced, and enabled to perform their natural functions; and we may further conclude, that this result is favoured by the want of proper temperature as the plants approach maturity. To return to the question involved in the propagation of plants by means of their leaves: if we take a Gloxinia as an example, when in its perfect state of development, we shall find it furnished with root, stem, leaves, and the floral apparatus, each bearing their respective characters, and performing their allotted functions of nutrition and reproduction. Now, it cannot be denied that if these parts are maintained in their reciprocal relation to each other, the leaves would provide, or rather prepare, the proper nourishment for the flowers, and these in their turn would assist in bringing forward the seeds imbued with the principle of life, and capable by its exercise of perpetuating their race; when this process was completed, the leaves would naturally decay, but if this course of nature is interrupted—if the leaves are removed without having expended their powers in the discharge of their natural functions, and are then placed under suitable and congenial circumstances, each of them may be converted into several separate and distinct seats of life; that is to say, several young plants can be produced from each leaf, and these young plants will, in due time, become furnished with all the parts necessary to render them perfect (root, stem, leaves, and floral apparatus), and thus will be enabled to perpetuate, by seeds, the race from which they sprung. If it could reasonably be assumed, and were even admitted, that in the Acorn an Oak tree may be detected, with all its parts present, though in miniature!! (which, by the way, is not the case,) would it be possible, even with a proportionately increased magnifying power, to detect the various organs which this leaf-propagation brings into existence? These must be present within the tissue of the leaf in their ultimate character, if Morphology be not true. And if it be not possible to detect them (and most certainly it is not), then we are forced to the conclusion that the living organisable tissue of the plant is acted on by the circumstances and conditions in which the plant is placed, and consequently, that all the appendages of the vegetable axis being developed from this tissue, under the influence of these circumstances and conditions, are of one common origin; therefore, I repeat that in the vegetable kingdom the nature of the development becomes changed, according to the circumstances under which the parts are developed.—*T. Moore.*

Pine-apples.—In reply to an "Admirer of well-grown Pines," I beg to state that the plants which produced the large fruit at Gunnersbury Park were planted in the fruiting pit in July, 1842; they were then about six months old. With respect to manure, two good one-horse cart-loads of fresh horse-dung is sufficient to make a lining all round the pit. The manure of two horses regularly applied would, I have no doubt, keep up sufficient heat in the pit to bring the fruit to perfection: the lining was all turned over once in 14 days, one half being turned every seven days. From the appearance of the fruit I should suppose it was good in quality.—*G. Mills.*

COUNTRY SHOWS.

Bedhampton Cottage Gardeners' Shour, Sept. 28.—This was the third and last Exhibition for the season. The prize flowers—the Dahlia and China Asters—together with the bouquets of various flowers, did great credit to the parties; one, in particular, had been but twelve months in possession of his allotment, and succeeded in producing, both in variety and quality, a display that showed most favourably his exertion and good taste. The vegetables were admirable; some of the Onions exceeded 14 inches in circumference. The winner for the best basket of Vegetables had Cabbages, Carrots, Parsnips, Onions, Potatoes, Lettuces, Radishes, two sorts of Beans, Cucumbers, Pumpkins, Spinach, Turnips, Peas, Brussels Sprouts, Celery, and Endive, all from a few rods of ground, in such condition that they might have been envied by the owner of many a large garden, with all his appliances and means to boot. There was an excellent feeling evinced among all parties—many a good-humoured challenge, one against the other, as to their mutual position the next time they meet in opposition; and all that came in but second were fully resolved that it should not be for want of exertion if they did not carry off the prizes next season. From circumstances that transpired, it might have been seen that the allotment system might be considered the poor man's regenerator—by which, with sobriety and pains-taking, he might fairly hope to win a solid, manly, independent position, creative of an interest in the land around him; a self-respect and a self-reliance that cannot be sought by him through any other channel; indeed, many a wasted hour might thus be made to add comforts to the family circle. The same philanthropic gentlemen, managing the allotments, would, no doubt, lend their kind assistance to arrange an Exhibition of this character, which might be the means of adding so materially to the produce from the allotments; the necessary funds would be but small; the emulation being so circumscribed, would be the more enjoyed and the more stimulating, and cannot fail in producing in the end results of the most satisfactory character.

Royal Horticultural Society of Cornwall.—This was the 41st Exhibition, and the last for the present year. The display of flowers, plants, and fruit was good, and there were also many choice and well-grown specimens. The fruit was remarkably fine, and particularly the Pines, Grapes, and Melons. The following prizes were awarded:—Fruit—*Pine-apple*: 1, J. Vivian, Esq.; 2, Queen, Earl of Falmouth. *Heaviest do.*: Black Jamaica, 3 lbs. 5 ozs., J. Vivian, Esq. *Melon*: King's Own Greenflesh, 1, W. Daubuz, Esq.; 2, King's Own Greenflesh, Mrs. Bull. *Grapes*: White Muscat of Alexandria, 1, Earl of Falmouth; 2, Red Hamburgh, Sir C. Lemon, Bart., M.P. *Best dish of do.*, of named sorts: Black Frontignan, White Frontignan, Muscat of Alexandria, Black Hamburgh, Victoria, Black Prince, 1, J. P. Magor, Esq.; 2, White Muscat of Alexandria, Black Constantia, White Frontignan, Black Prince, Grizly Frontignan, Black Hamburgh, Earl of Falmouth. *Peaches*: Noblesse, 1, J. Vivian, Esq.; 2, Red Magdalen, A. Fox, Esq.. *Best dish of do.*, of sorts: Chancellor, Red Magdalen, Grimwood's Royal George, Violet Hâtive, Admirable, Noblesse, Royal Kensington, Old Royal George, 1, J. P. Magor, Esq.; 2, Admirable, Royal Kensington, Violet Hâtive, Smith's Newington, Ford's Seedling, Noblesse, Royal George, J. Vivian, Esq. *Nectarines*: Elruge, 1, Rev. C. Rogers; 2, Elruge, Sir J. C. Rashleigh, Bart. *Best dish of do.*, of sorts: Veitch's Seedling, Bowden's Seedling, Elruge, Peterborough White, Scarlet, J. P. Magor, Esq. *Pears*: Duchesse d'Angoulême, 1, Capt. Reynolds, C.B.; 2, Summer Bon Chrétien, A. Fox, Esq. *Apples*: Kerry Pippin, 1, Rev. C. Rogers; 2, Ribstone Pippin, Rev. T. Phillpotts. *Cherries*: Morello, W. Daubuz, Esq. *Plums*: Coe's Golden Drop, 1, Sir C. Lemon, Bart., M.P.; 2, Coe's Golden Drop, G. C. Fox, Esq. Extra.—*Cherries*: Morello, Sir C. Lemon, Bt., M.P. *Currants*. White Dutch, J. S. Enys, Esq. Flowers.—Collection of *Ornamental Plants*: Æschynanthus grandiflora, Achimenes longiflora, A. grandiflora, Passiflora kermesina, Clerodendron paniculatum, Stephanotus floribundus, Vinca rosea, V. alba, Manettia glabra, and two Balsams, Rev. T. Phillpotts. *Ornamental Plant*, in flower: Veronica asteroides, G. N. Simmons, Esq. Best named collection of *Stove Plants*, in flower: 1, Achimenes longiflora, Rondeletia speciosa, Gesnera zebrina, Ardisia crenulata, Ixora crocata, I. bandhuca, J. P. Magor, Esq.; 2, Gloxinia maxima, G. rubra, Achimenes rosea, A. longiflora, A. grandiflora, Browallia alata, B. alba, Thunbergia alata, T. aurantiaca, Lantana mutabilis, L. crocea, Ipomœa quamoclit, Mammillaria pulchra, G. N. Simmons, Esq. *Single specimen of ditto*: Lisianthus Russellianus, F. Passingham, Esq. *Collection of Orchidaceous Plants*: 1, Stanhopea oculata, Acropera Loddigesii, Oncidium Papilio, Epidendrum cuspidatum, Oncidium flexuosum, Epidendrum cochleatum, Cattleya Loddigesii, C. Forbesii, Gongora maculata, J. P. Magor, Esq.; 2, Cattleya Harrisoniæ, Epidendrum ciliatum, Zygopetalum Mackai, Catasetum luridum, C. tridentatum, Epidendrum cochleatum, Oncidium leucochilum, G. C. Fox, Esq. *Specimen of ditto*: 1, Stanhopea oculata, J. P. Magor, Esq.; 2, Cymbidium aloefolium, Sir C. Lemon, Bart., M.P. *Fuchsias*: Silver Medal, 1, Harrison's Goldfinch, Grovehilli, Epps's Duke of Wellington, Harrison's Pearl, Defiance, Cormackii, G. N. Simmons, Esq.; 2, Eppsii, Rogersiana, Grovehilli, Smith's Alata, Frostii, Smith's Majestica, F. Passingham, Esq.; 3, Robusta, Majestica, Champion, Venus Victrix, Magnifica, W. Hockin, Esq. *Dahlias*, dissimilar blooms: 1, Mrs. Shelley, Paul Pry, Admiral Stopford, Great Mogul, Mrs. J. Richardson, Swindon Rival, Lee's Bloomsbury, Antagonist, Prince of Wales, Standard of Perfection, Essex Triumph, Aurantia, Twyford Perfection, Bedford's Surprise, Princess Royal, President of the West, Hero of Stonehenge, Mr. R. Dunn; 2, Essex Triumph, Bridesmaid, Indispensable, Rouge et Noir, Perpetual Grand, Westbury Rival, Sir Robert Sale, Yellow Perfection, Egyptian Prince, Marquess of Lansdowne, Lady Cooper, Twyford's Perfection, Bedford Surprise, Prince Albert, Wheeler's Maria, Antagonist, Competitor, Princess Royal, G. C. Fox, Esq. *Best 12 ditto*: 1, Phenomenon, Swindon Rival, Essex Triumph, Dodd's Prince of Wales, Admiral Stopford, Mrs. Shelley, Great Mogul, Satirist, Antagonist, Standard of Perfection, Lady Antrobus, Dodd's Orange Superb, Mr. R. Dunn; 2, Prince Albert, Bedford Surprise, Sir Robert Sale, Yellow Perfection. Competitor, Princess Royal, Twyford's Perfection, Westbury Rival, Perpetual Grand, Essex Triumph, G. C. Fox, Esq.; 3, Beauty of the Plain, Pickwick, Lady Cooper, Bridesmaid, Standard of Perfection, Beauty of Sussex, Highgate Rival, Princess Royal, Widnall's Eclipse, Rouge et Noir, Virgin Queen, Andrew Hofer, Rev. C. Rogers; 4, Dodd's Prince of Wales, Essex Triumph, Princess Royal, Mrs. Shelley, Rouge et Noir, Lady Cooper, Prince Albert, Northern Beauty, Lee's Bloomsbury, Antagonist, J. S. Enys, Esq. *Best 6 striped or tipped ditto*: 1, Princess Royal, Queen of the Isles, Oakley's Surprise, Rainbow, Bridesmaid, Lady St. Maur, W. Daubuz, Esq.; 2, Princess Royal, Painted Lady, Glory of Plymouth, Purpurea alba, Northern Beauty, Charles 12th, J. S. Enys, Esq. *Roses, Cut Flowers*: Anna Maria, Yellow China, Indica, Carnescens, Jaune Desprez, Devoniensis, R. W. Fox, Esq.; 2, Phœnix, Clara Sylvain, Aubernon, Smith's Yellow, Fulgoric, N. C. Stephens, Esq. *Verbenas*: Prince of Wales, Duke of Cornwall, the Bride, Tweediana grandiflora, Hendersonii, Hislopeana, Ponteyi, Ingramii, Odoratissima, and three Seedlings, G. N. Simmons, Esq. Florists', Nurserymen, and Market Gardeners' Prizes.—*Dahlias*: dissimilar blooms, 1, Hero of Stonehenge, Claudine, Twickenham Rival, Beauty of Sussex, Perpetual Grand, Indispensable White, Sir J. Richardson, King of Sarum, Thompson's Vivid, Mrs. Shelley, Queen, Aurantia, Dodd's Favourite, Rainbow, Proctor's Nonpareil, Mrs. Shelley, Rembrandt, Emma Noke, Madalene, Essex Triumph, Standard of Perfection, Lady Antrobus, Orange Superb, Beuford Surprise, Silver Medal, Messrs. Veitch and Son; 2, Egyptian Prince, Princess Royal, Perpetual Grand, Sir J. H. Richardson's Union, Admiral Stopford, Antagonist, Euclid, Orange Superb, President of the West, Rouge et Noir, Indispensable, Standard of Perfection, Queen of Trumps, Bedford Surprise, Argo, Hero of Stonehenge, Pickwick, Lady Cooper, Virgil, Essex Triumph, Burnbank's Emma Noke, Nonpareil, Mr. Pontey. *Best collection of Plants*: Veronica speciosa, Brugmansia parviflora, Boronia viminea, Cyrtoceras reflexa, Hydrangea japonica, Pentas carnea, Babingonia camphorosmæ, Columnea grandiflora, Mr. Pontey.—*From the West Briton.*

Morningside Practical Gardeners' Society, Sept. 10.—This was the Autumn Meeting, at which the following prizes were awarded:—*Dahlias*: Mr. J. Downie, gr. to General Robertson, for Prince of Wales, Marquis of Lansdowne, Rouge et Noir, Prince Albert, Sir R. Sale, Essex Triumph, Perpetual Grand, Mrs. Shelley, Highgate Rival, Beauty of Sussex, Bishop of Winchester, and Princess Royal. *Hollyhocks*: Mr. Downie, for four seedlings. *Phloxes*: Mr. Downie, for cordata grandiflora, Richardsonii elegantissima, and Brown's No. 40. *Marigolds*: French and African, Mr. J. Young, gr. to T. Oliver, Esq. *Border Annuals*: Mr. H. Gibb, gr., Salisbury Green, for Phlox Drummondii, Zinnia elegans, Coreopsis Drummondii, Viscaria oculata, Brachycome iberidifolia, and Clintonia elegans. *Pentstemons*: Mr. Downie, for Murrayanum fruticosum and gentianoides coccineum. *Petunias*: Mr. Downie, for Rosea superba, and Alfred. *Fuchsias*: Mr. Downie, for Eppsii, Globosa, and Exoniensis. *Herbaceous Plants*: Mr. J. Gould, gr. to J. A. Addie, Esq., for Delphinium, Barlowii, Phlox, Alcardii, Chelone barbata, Campanula grandis, and Pentstemon coccineum. *Melon*: Mr. W. Denholm, gr. to Sir J. Forest, Bart., for Netted Cantaloupe. *Plums*: Mr. Denholm, for Green Gage. *Jargonelle Pears*: Mr. Denholm. *Apples*: Mr. J. Fargie, gr., Canaan Lodge, for Ribstone Pippin and Oslin Pippin. *Apricots*: Mr. Penholm, for Moorpark. *Peaches*: Mr. Denholm, for Noblesse. *Retarded Gooseberries*: Mr. J. Swennie, gr. to T. Buckmaster, Esq., for Warrington Red. Amateurs.—*Dahlias*: Mr. J. Steel, for Fanny Keynes, Lee's Bloomsbury, Matilda, and Essex Triumph. Prize offered by Messrs. J. Dickson and Son, for the best 3 *Dahlias*: Mr. Downie, for Lady St. Maur, Standard of Perfection, and Prince Albert. Prize offered by Messrs. Lawson & Son, for the best 6 *China Asters*: Mr. Young. Prize offered by Messrs. Dickson and Co., for the best 6 *Phloxes*: Mr. Downie, for striata, Richardsonii bicolor, and Brown's No. 40. Prize offered by the same gentlemen, for the best 3 *Pentstemons*: Mr. Young, for Murrayanum, gentianoides, and g. splendens. Mr. Downie sent for exhibition 24 sorts of seedling Hollyhocks, for which an extra prize was awarded. *Dahlias—sorts not newer than* 1843: 1, Mr. Downie, for Perpetual Grand, Prince Albert, Bridesmaid, Duchess of Richmond, Sir R. Sale, Prince of Wales, Essex Triumph, Marquis of Lansdowne, Mrs. Shelley, Antagonist, Admirable, and Highgate Rival; 2, Mr. Gibb, for Beauty of the Plain, Princess Royal, Mrs. Shelley, Beauty of Sussex, Hero of Stonehenge, Admiral Stopford, Marquis of Lansdowne, Essex Triumph, Bishop of Winchester, Bridesmaid, Prince of Wales, and Lady Cooper.

North British Professional Gardeners' Society, Sept. 18.—This was the Autumn Meeting. The Prizes were awarded as follow:—*Dahlias*: 1, Mr. W. Thorn, for Standard of Perfection, Essex Triumph, Miranda, Prince Albert, Antagonist, Sir J. S. Richardson, Westbury Rival, Prince of Wales, Victory of Sussex, Lee's Bloomsbury, Paul Pry, Mrs. Shelley, Highgate Rival, Northern Beauty, President of the West, Queen of Trumps, Widnall's Victory, and Lady St. Maur; 2, Mr. J. Addison, for Mrs. Shelley, Essex Triumph, Sir J. S. Richardson, Queen of Roses, Prince of Waterloo, Hudson's Princess Royal, Standard of Perfection, Lady Harland, Duchess of Richmond, Phenomenon, Bishop of Winchester, Indispensable, Nonpareil, Proctor, Lady St. Maur, Sir R. Sale, Ophir, Admiral Stopford, and Burnham Hero; 3, Mr. P. Thomson, for Sir J. S. Richardson, Hudson's Princess Royal, Phenomenon, Essex Triumph, Mrs. Shelley, Admiral Stopford, Sir R. Sale, Virgil, President of the West, Frederick the Great, Lady Antrobus, Hope, Prince of Wales, Glory of Plymouth, Lady Cooper, Indispensable, Nonpareil, and Standard of Perfection. Messrs. Dickson and Co.'s Prize for the best 6 *Fuchsias* was awarded to Mr. J. Downie, for Epsii, Brockmannii, Fulgens, Multiflora, Exoniensis, Magnifica, and Excelsa. Messrs. Eagle and Henderson's Prize for the best 6 *Gloxinias* was awarded to Mr. John Young, for Hybrida rubra, bicolor, candida, and speciosa. Messrs. W. Ballantyne and Son's Prize for the 6 best *Carnations* was won by Mr. P. Thomson, with Ely's Magnificent, Ely's Lord Lonsdale, Wilson's Gem, Wilmer's Keomachus, Hercules, and Mayor of Rippon. The Prize offered by the same gentleman for the best 6 *Picotees* was awarded to Mr. D. Foulis, for Ely's Great Western, Ely's Criterion, Mitchell's Nullus Secundus, Robertson's Nottingham Hero, Gedding's Diana, and Purple Perfection. Amateur Prize for the best 4 *Pentstemons* was given to Mr. White, for Murrayanum, coccineum, and fruticosum. *Phloxes*: Mr. J. Downie, for Richardsonii, stricta, elegantissima, cordata, grandiflora, and Brown's No. 40. *Dahlias*: Antagonist, Prince Albert, Beauty of Sussex, Mrs. Shelley, Duchess of Richmond, Standard of Perfection, Mr. J. Downie, gr. to General Robertson. *China Asters*: Mr. J. Young, gr. to T. Oliver, Esq. *Lobelias*: fulgens, atrosanguinea, propendens, Mr. J. Downie. *Verbenas*: Vivid, Howardiana, Princess Royal, Ignea, Burleyana, Mr. J. Downie. *Salvias*: Patens, Fulgens, Chamædryoides, Mr. A. Foulis. *Exotic Plants*: Tacsonia pinnatistipula, Erica Bowieana, Zygopetalum Mackai, Pimelea hispida, Brugmansia sanguinea, and Phœnecoma prolifera, Mr. G. Stirling. *Grapes*: Black Hamburgh, 1, Mr. J. Young, 2, Mr. D. Foulis. *Muscat of Alexandria*: 1, Mr. D. Foulis; 2, Mr. Goodall. *Best Bunch of any Sort*: (White Frontignan) 1, Mr. Watson; 2, Mr. A. Foulis. *Plums*: 1, Washington, Green Gage, and Magnum Bonum, Mr. Young; 2, Mr. Stirling. *Peaches*: Royal George, Red Magdalen, and Noblesse, Mr. Thomson. *Nectarines*: 1, Mr. Young; 2, Mr. Thomson. *Green Fleshed Melon*: 1, Duke of Bedford, Mr. A. Foulis; 2, Mr. Watson. *Jargonelle Pears*: 1, Mr. Thomson; 2, Mr. Thom.

Stockwell Flower Show, July 25.—This was the fourth and last Exhibition for this year. Several prizes were awarded, but we have only been furnished with a list of rewards without the names of the flowers for which they were given.

Warrington Floral and Horticultural Society.—This Society has held two Exhibitions during the present year, which have more than realised the most sanguine expectations of its friends and supporters. The supply of stove and greenhouse plants, as well as fruit and vegetables, has been more abundant, and many of the specimens indicated greater care and attention in their cultivation than we have been accustomed to see at these meetings. For the first time, prizes for cottagers' window plants were added. Amongst other novelties, a case on Ward's principle was shown by Dr. J. Kendrick; in this, plants of almost every description, from the tender exotic to the hardy perennial, were growing together in the greatest luxuriance and harmony; it excited much attention. At this Show there was a rich display of finely cultivated fruit. The Pines exhibited by W. Hall, Esq., in particular, were considered the finest seen here for many years past. The show of Dahlias was not quite so plentiful as last year, in consequence of the late heavy rains, and the prevalence of the thrip amongst them; but there were many new beauties exhibited, and upon the whole there was a much less proportion of coarse varieties than usual. The following are the Prizes which have been awarded during the year:—*Spring Meeting, May* 23.—Tulips.—Premier, George the Fourth, Mr. Hardy. *Feathered Bizarres*: 1, Catafalque superieure, Mr. Hardy; 2, Magnum Bonum, Mr. Hardy; 3, Scholes's Delight, Mr. Nunnerley; 4, Duc de Savoie, Mr. Hardy; 5, George the Fourth, Mr. Hardy; 6, Demetrius, Mr. Hardy. *Flamed Bizarres*: 1, Albion; 2, Catafalque superieure; 3, San Josef; 4, Platoff; and 5, Lustre, Mr. Hardy; 6, Surpasse catafalque, Mr. Penketh. *Feathered Byblomen*: 1, Bienfait, Mr. Nunnerley; 2, La belle Narena, Mr. Hardy; 3, Washington, Dr. J. Kendrick; 4, Baguet, Mr. Hardy; 5, Toute, Mr. Hardy; 6, Turner's No. 18, Mr. Nunnerley. *Flamed Byblomen*: 1, Violet fond Noir, Mr. Penketh; 2, Violet wallers, Mr. Hardy; 3, Turner's Queen Victoria, Mr. Hardy; 4, Toute, Mr. Penketh; 5, Premier Noble, Dr. J. Kendrick; 6, Washington, Mr. Penketh. *Feathered Roses*: 1, Do-little, Mr. Hardy; 2, Lady Crewe, Mr. Hardy; 3, Hero of the Nile, Mr. Bather; 4, Walworth; 5, Herome; and 6, Count Vergennes, Mr. Hardy. *Flamed Roses*: 1, Lord Hill; 2, Unique; 3, Lady Crewe; 4, Rose Guerrier; 5, Vesta; and 6, Triumph Royal, Mr. Hardy. *Bizarre Breeder*: Polyphemus, Mr. Nunnerley. *Byblomen Breeder*: Roi Siam, Mr. Hardy. *Rose Breeder*: Duchess of Newcastle, Mr. Hardy. *White Self*: White Flag, Mr. Hardy. *Yellow Self*: Mm d'Or, Mr. Nunnerley. *Stove Plants*: 1, Cactus Ackermanni, Mr. J. Clare; 2, Oncidium flexuosum, Mr. Dobson, gr. to J. W. Patten, Esq., M.P.; 3, Euphorbia splendens, W. Hall, Esq.; 4, Cactus speciosus, Mr. Dobson. *Greenhouse Plants*: 1, Epacris grandiflora, Miss F. Hornby; 2, Calceolaria, Royal Standard, Mr. R. Allen; 3, Fuchsia Venus Victrix, Dr. J. Kendrick; 4, Tropæolum pentaphyllum, Mr. J. Clare. *Herbaceous Plants*: 1, Ramonda pyrenaica, Mr. Wilson. *Pelargoniums*: 1, Joan of Arc, Mr. J. Clare; 2, Coronation, Mr. Clare; 3, Dennis's Perfection, Mr. Dobson; 4, British Lion, Mr. Hunt. *Best Pan of Flowers*: Mr. Dobson. Fruit and Vegetables.—*Pine Apple*: Montserrat, Mr. Hunt. *Potatoes*: Kidney, Mr. Dobson. *Rhubarb*: Victoria, Mr. J. Clare. *Asparagus*: W. Hall, Esq. *Rhubarb*: Victoria, Mrs. Warburton. *Potatoes*: Kidney, Mr. J. Eaton. Extra Prizes: Fuchsia gracilis, Mr. J. Clare; Aphelexis humilis, Mrs. Wagstaffe; Cereus flagelliformis, Mr. Hunt

Calceolaria, Lady Constable, Mr. R. Allen; Moss Rose, Mr. J. Clare.——*Autumn Meeting, September* 19.—DAHLIAS.—Premier, Standard of Perfection, Mr. Hardy. *Dark or Maroon*: 1, Essex Triumph, Mr. J. Wright; 2, Admiral Stopford, Mr. Hardy; 3, Rouge et Noir, Mr. J. Wright. *Purple*: 1, Standard of Perfection, Mr. Hardy; 2, Pickwick, Mr. J. Wright; 3, Medea, Rev. T. Hinde. *Crimson*: 1, President of the West, Mr. Hardy; 2, Coronation, Mr. Hardy; 3, Indispensable, W. Hall, Esq. *Scarlet*:—1, Bloomsbury, Mr. J. Wright; 2, Dancroft Rival, Rev. T. Hinde; 3, Vivid, Mr J. Wright. *Rose*: 1, Maria, Mr. Hardy; 3, Hope, Mr. J. Eaton. *Lilac*: 1, Mrs. Shelley; 2, Lady Harland; and 3, Widnall's Queen, Mr. J. Wright. *White*: 1, Lewisham Rival, W. Hall, Esq.; 3, The Bride, Mr. Hardy. *Yellow*: 1, Parkmount Rival; and 2, Prince of Wales, Mr. J. Wright; 3, Cox's Defiance, Rev. T. Hinde. *Orange, Buff, or Bronze*: 1, Prince Albert, Mr. J. Wright; 2, Duchess of Richmond, Mr. Hardy; 3, Nicholas Nickleby, Mr. J. Wright. *White tipped, &c.*: 1, Lady Antrobus; 2, Phenomenon, Mr. Hardy. *Yellow or Buff tipped, &c.*: 1, Princess Royal; and 2, Unique, Mr. Hardy. *Seedlings*: 1, White tipped purple; 2, Red; and 3, Maroon, Mr. Hardy. *Pansies*: 1, Dr. J. Kendrick for Wilhelmina, Dowager Queen, Mulberry, General Reta, Peter Dick, Adelaide, Maria, Lady Douglas, and two seedlings. *Stove Plants*: 1, Cactus Ackermanni, Dr. J. Kendrick; 2, Achimenes coccinea, Mr. Bloore; 3, Lantana mutabilis, Mr. Bloore; 4, Gongora atropurpurea, Mr. Dobson. *Greenhouse Plants*: 1, Petunia triumphans, Dr. J. Kendrick; 2, Thunbergia alata, Mr. J. Clare; 3, Fuchsia exoniensis, Mr. Bloore. *Herbaceous Plants*: 1, Gladiolus psittacinus, W. Hall, Esq.; 2, Pentstemon coccineum, Mr. Dobson; 3, Lupinus Cruikshanksii, Mr. Penketh; 4, Cyclamen europeum, Mr. J. Clare. FRUIT AND VEGETABLES.—*Best Vine in a Pot*: Black Hamburgh, Mr. Dobson. *Pine Apple*: Montserrat, W. Hall, Esq. *Grapes*: Black Hamburgh, Mr. Hall. *Melons*: Peach, Mr. Dobson. *Plums*: Magnum Bonum, W. Hall, Esq. *Cherries*: Morello, Mr. Bloore. *Celery*: Seymour's White, W. Hall, Esq. AMATEURS.—*Apples*: Alexander, Mrs. Clare. *Peas*: Scimitar, Mr. P. Davies. *Onions*: White Port, Mr. Hardy. *Red Cabbage*: Mr. J. Eaton. *Celery*: Lancashire solid Red, Mr. J. Eaton. *French Beans*: Mr. Davies. COTTAGERS' PRIZES.—Fuchsia multiflora and Senecia elegans, Mr. R. Brett. EXTRA PRIZES.—*Grapes*: Black Hamburgh, Mr. Dobson. *Red Cabbage*: Mrs. Wagstaffe. *Pine Apple*: Enville, Mr. Hunt. *Plums*: Magnum Bonum, Mr. Clare, jun. *Apples*: Hawthornden, Miss Burdett.

Wingham Horticultural and Floral Society, Sept. 19.—This was the autumnal Exhibition. There was, as usual, a good display of fruits and flowers. The following is the award of Prizes:—PLANTS IN POTS.—*Fuchsias*: Exoniensis, Conspicua, Aurantia, Mr. Sankey. *Petunias*: Punctata, Lady Peel, Seedling, Mr. Sankey. *Climbing Plant*: Passiflora quadrangularis, D. Denne, Esq. *Best Rose*: Madame Sevigné, J. Godfrey, Esq. *Greenhouse Plants*: 1, Pentas carnea, Lantana acuminata, Angelonia salicariæfolia, Marchioness Conyngham; 2, Cotyledon ovata, Rochea falcata, Echeveria coccinea, Mr. Sankey. *Best one*: Cassia corymbosa, Mr. Sankey. *Stove Plant*: Achimenes coccinea, Marchioness Conyngham. *Dahlias*: 1, Eclipse, Northern Beauty, Admiral Stopford, Mrs. Shelley, Prince of Wales, Essex Triumph, Lady Cooper, Sir R. Chester, Pickwick, Queen, Vivid, Antagonist, the Rev. J. G. Hodgson; 2, Defiance, Andrew Hofer, Lee's Bloomsbury, Queen, Pickwick, Argo, Suffolk Hero, Grace Darling, Exquisite, Springfield Rival, Bridesmaid, Seedling, Mr. G. Denne; 3, Mrs Shelley, Phenomenon, Lee's Bloomsbury, Hope, Prince of Wales, Le Grand Baudin, Princess Royal, Antagonist, Andrew Hofer, Virgin Queen, Essex Triumph, Springfield Rival, Mr. Sankey. *Best six*: 1, Asmodeus, Queen, Blue Bonnet, Eclipse, Admiral Stopford, Northern Beauty, the Rev. J. G. Hodgson; 2, Vivid, Mrs. Shelley, King of Lilacs, Essex Triumph, Bedford Surprise, Competitor, the Rev. C. Baylay; 3, Andrew Hofer, Bridesmaid, Queen, Pickwick, Maria, Exquisite, Mr. G. Denne. *Verbenas*: 1, Tweediana, Princess Royal, Rosea alba, Bridesmaid, Prince of Wales, Ruby, Hendersonii, Queen, Stewartii, Mr. Sladden; 2, Rosea alba, Tweediana, Stewartii, Princess Royal, Duke of Cornwall, Tweediana picta, Queen, Eximia, Melindres, Mr. Sladden. *Annuals*: Lupinus mutabilis, L. elegans, Erysimum angustifolium, Collinsia bicolor, Malva zebrina, Phlox Drummondii, Zinnia elegans coccinea, French Marigold, Spanish pink, the Rev. C. Baylay. *Hardy Perennials*: Lobelia fulgens, Pentstemon gentianoides, P. coccineum, P. pulchellum, Phyteuma campanuloides, Aster puniceus, Rudbeckia fulgida, Antirrhinum grandiflorum, Dracocephalum speciosum, Linaria dalmatica, Phlox omniflora, Coreopsis lanceolata, Lupinus rivularis, the Rev. C. Baylay. *Roses*: Eliza Sauvage, Nerine, Louis Bonaparte, Yellow China, Crimson China, Acidalie, J. Godfrey, Esq. FRUIT.—*Melon*: 1, Fletcher's Greenflesh, D. Denne, Esq.; 2, Egyptian Greenflesh, Lady Montresor. *Grapes*: Black Hamburgh, J. M. Hilton, Esq.; Muscat of Alexandria, Sir B. W. Bridges, Bart.; Black Hamburgh, J. Godfrey, Esq.; Frontignan, D. Denne, Esq. *Best collection*: Black Hamburgh, White Frontignan, Sweetwater, Claret, Muscadine, Black Frontignan, White Nice, J. Godfrey, Esq. *Figs*: Purple Ischia, the Rev. C. H. Hallet. *Peaches*: 1, Red Chancellor, Mr. Cozens; 2, Early Admirable, Mr. J. Elgar. *Nectarines*: Elruge, Mr. Cozens. *Plums*, grown against a wall: 1, Golden Drop, Mr. Cozens; 2, ditto, Sir B. W. Bridges, Bart. *Plums*, not grown against a wall: 1, Golden Drop, Marchioness Conyngham; 2, White Imperatrice, D. Denne, Esq. *Cherries*: Morello, Marchioness Conyngham. *Pears*, grown against a wall: 1, Jargonelle, S. M. Hilton, Esq.; 2, ditto, Sir B. W. Bridges, Bart. *Pears*, not grown against a wall: 1, William's Bon Chrétien, Mr. Sladden; 2, ditto, Mr. Dadds. *Apples*: 1, Kerry Pippin, Mr. Elgar; 2, ditto, Mr. Sankey. *Kitchen Apples*: Fair Maid of Wishford, Mr. J. Elgar. VEGETABLES.—*Peas*: Knight's Marrow, Mr. Cart. *Celery*: Solid Red, Mr. D. Deverson. *Carrots*: Altringham, Marchioness Conyngham. *Broccoli*: Cape, Mr. Elgar. *Kidney Potatoes*: 1, White Holland, D. Denne, Esq.; 2, Ramshorn, Mr. D. Deverson. *Cucumbers*: Roman Emperor, Mr. G. Denne.

Reviews.

Suggestions towards an Inquiry into the present Condition of the Labouring Population of Suffolk. By the Rev. J. S. Henslow, M.A., Rector of Hitcham.

WE beg—nay, we entreat the attention of all who are interested in the welfare of the poor—to this pamphlet, written by one of the most zealous and sober-minded men among the English clergy, and who is thoroughly acquainted with the *facts* relating to the rural population. It is more especially to Londoners that its contents are important, so that they may not be misled by a part of the London newspaper press, of great authority with them—and justly so when the subjects treated of are understood. Cockney reporters are not the persons to come to a correct judgment relating to country matters; and still less are they likely to do so when they quit the metropolis with only one eye open, and that with a twist in it. The cause of the incendiary fires, and perilous condition of the Suffolk peasantry, are traced by Prof. Henslow to their true cause—want of employment at fair wages, and to that only; in which we wholly agree with him. Why that want exists is a question which the *little* farmers, without capital or energy, can answer better than anybody. In the meanwhile, till they make their statement, which may be expected about the Greek Calends, Mr. Henslow's excellent pamphlet may be taken as a true exposition of the case.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

LAELIA* BICOLOR. Two-coloured Laelia. (*Stove Epiphyte*) Orchidaceæ. Gynandria Monandria.—This fine plant was sent to the Horticultural Society from Guatemala by Mr. Hartweg, who found it in the mountains of Salama, in the province of Vera Paz, also near the village of Sunil, near Quezaltenango, in Guatemala, growing on rocks, at an elevation of about 700 feet above the sea. In May, 1843, it produced its flowers, and ever since has been in such bad health that it is doubtful if it will survive. In habit the species is so like some of the Peristerias with pendulous racemes, that it would certainly be mistaken for them; and in structure it approaches them no doubt very closely. It is, however, essentially distinguished by the labellum and pollen apparatus. In Peristerias the labellum, although having a moveable joint in the middle, is continuous with the column by a thick fleshy base; here the articulation at that part is very conspicuous. The Peristerias have four pollen-masses; here we have but two. And, finally, the strap by which the pollen-masses cohere is long and slender, like that of a Lycaste, not deficient, so as to render the pollen-masses sessile upon a crescent-shaped gland as in Peristeria. The flowers of this plant are formed in a pendulous raceme, as much as 18 inches long; the lower part being clothed with distant short blunt scales, which extend into bracts about half the length of the pedicels. Each raceme consists of nine or ten flowers of a dull greenish-yellow, covered externally with short hairs; their petals have three streaks of violet; their lip is downy all over the upper surface, dark purple in the middle, with two or three spots of the same colour near the point. In the centre of the lower half is a large shaggy hump. It may be grown in a wire basket like a Stanhopea, or tied to a block of wood and suspended to a rafter, in a moist stove. If potted in the usual way, the flower-spike will be apt to go down into the soil and perish. Like many other Orchidaceous plants it requires an ample supply of water during the growing season, and shade in sunny weather, at a temperature between 80° and 90° by day, but not above 70° at night. Towards the end of October water should almost be withheld for a few weeks, no more being given than will prevent the pseudo-bulbs from shrivelling.—*Botanical Register.*

Garden Memoranda.

Mr. Scambler's, West Green, Tottenham.—There is now in full bloom at this place two fine standard trees of the Tamarix gallica, or French Tamarisk. They are about 11 feet 9 inches in height, and each head measures about 5 feet in circumference. This elegantly-drooping slender-branched shrub is well known in gardens, but it is seldom that it favours us with so rich a display of its pretty clusters of reddish-coloured blossoms. It is exceedingly handsome as a standard, and is well suited for ornamenting shrubberies, being perfectly hardy, and thriving well in almost any soil or situation. It may be increased freely from cuttings planted in the open ground in spring or autumn.

Miscelianeous.

Cultivation and Planting of the Ranunculus.—The soil should be trenched 18 or 20 inches, and composed of good rich loam, to which add ⅓ part of very old, well rotted cow manure, and the same quantity of clay broken into small pieces; add to this a little sand, and thoroughly mix the whole; if the soil binds, add some sandy peat; make the bed on a level with the path or walks; the plants would do better if the bed was *below* rather than *above* the level. Having prepared the soil, as above, sometime during the summer or autumn, take the *earliest* opportunity in the succeeding spring to stir up the bed one spit deep, and take off 1½ inch of the soil; then place the plants in an upright position on the surface, 6 inches apart each way, and replace the soil carefully, which will cover the crown of the Ranunculus about 1½ inch; deeper planting would be injurious. After the plants appear, keep them free from weeds, and press the soil firmly around the plants after they get two inches high. If the weather prove dry, water them freely early in the morning, and shade them from the sun from 9 o'clock, A. M. to 3 o'clock, P. M. As soon as the foliage becomes yellow, take the roots up and dry them thoroughly in the shade, and keep them in a dry place. The Ranunculus loves a cool and moist situation, but no stagnant water should be permitted, nor should they be placed under the shade or dripping of trees. The morning sun, free circulation of air, and shade as directed, will insure success.—*Hovey's Magazine of Horticulture*

New Echites.—At the last meeting of the Horticultural Society, Mr. Loraine exhibited a very fine twiner, under the name of E. carassa. Upon an examination of the writers on the genus Echites, it turns out that no such plant is recorded by them; it, however, proves to be the Echites crassinoda of Mr. Gardner, which the younger De Candolle has separated, with some others, under the name of Dipladenia, to which genus Echites splendens and atropurpurea also belong. The name of Mr. Loraine's plant will therefore be Dipladenia crassinoda.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

FROM October to May the principal watering in the stove should be done before noon, and to the middle or end of January the house should be kept as dry as possible; a slight syringing, however, will be useful to keep the foliage clear from dust, &c. A sunny morning is the best time to water over head, and once in ten days will be often enough. All plants that require pruning or thinning out before the next growing season should be dressed at once, to give more room for the rest. Clerodendrons, Vincas, and other fast-growing plants which require large pots in summer, should never be wintered in these large pots; turn them out, and shake all the soil from the roots, and place them in as small pots as you can get their roots into, but do not prune the roots much at this time.

* This was one of the names of Helen, and may be applied to this plant because of its beauty: but it may also be derived from λαξις, a cleft, in allusion to the divisions of its lip.

Conservatory.—From this time till late in the spring some Climbers in this house will require pruning and thinning out; the whole of them will require a little dressing now, or soon, especially where they obstruct the light. Where only one climber is grown, it must be pruned according to the time you want it to be in flower next summer—the earlier they are wanted to flower, the sooner they must be pruned. One great advantage in Climbers of this nature is, that most of them flower on the current year's growth, like the Grape Vine, all such ought to be very closely pruned at the final dressing. Some people are afraid to cut off much wood, and their plants soon get disordered; the Lapageria Leaves is the first to offer in this way; when this plant has filled the space intended for it, the side shoots should be cut to the first plant next the old wood, and as the plant gets older many of these side shoots must be cut out altogether. The Lapageria Loddigesii, although an annual, is well worth growing for a warm conservatory, on account of its fine large white flowers, which open at night. It should be treated as a biennial: sow it early in July, and keep it in pots in the house through the winter, harden it at the end of spring, and plant it out in a rich border in the conservatory about the end of May; it roots as freely from cuttings as the I. Leavis.

Pits and Frames.—A very great disadvantage in wintering plants for the winter is to have them in dirty pots, often covered with green and black slime, which creates damp enough to kill one half of the plants in them. Everything in and about plant frames ought to be kept as clean and as dry as possible, until March at least. The lights should be taken off and hardy plants every fine day, and no rains or dews should be allowed to fall on the plants from this time until the turn of the season early in the spring; all that time the plants ought to have the benefit of all the sun-heat our climate affords, and no more fire-heat than will just secure them from frost.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

Now that the frosts have rendered the flower-gardens shabby for the season, the principal thing to attend to will be the storing of such plants as it is desirable to preserve another season. I am not an advocate for preserving many tender plants, but there are certain tribes which bloom all the better for being a year or two old. Among these I class more particularly Scarlet Pelargoniums and Shrubby Calceolarias, and therefore make it a rule to keep all the plants I can possibly find room for. Calceolarias I generally put in the smallest sized pots I can get them into, and if convenient, I plunge them for a week or two in a close pit, but if not, they are placed at once under the greenhouse stage, where they remain until they are turned into cold pits in spring. For Scarlet Pelargoniums I have a range of span-roofed pits filled with tan, which at this season receives sufficient fresh material to excite a gentle fermentation in the whole mass. In this tan the Pelargoniums are planted, after being cut down, stowing them as thickly as possible, and the pits are kept pretty close until the plants have made some young leaves, after which they are moved to the air, and receive the same treatment as other plants, taking care, of course, to secure them against frost throughout the winter. In spring, about March, they are potted and placed in heat until they are well established, after which they are hardened off preparatory to being planted out in May. These plants are excellent for dwarf beds, as they do not grow so vigorously as young ones. Scarlet Pelargoniums may also be preserved in boxes securely packed in dry peat earth, but as I have no experience in the matter I had better refer the reader to an article on the subject in the *Chronicle* for last year, from the pen of Mr. Gordon. I also take up carefully such plants as Nierembergias and Mesembryanthemums, but Verbenas, Petunias, and the like, I do not consider worth the trouble.

Pits and Frames.—All plants in this department should be got in order for the winter as quickly as possible; those that are well established may be placed in their winter quarters at once, giving the most valuable ones the best places, but those that are not well rooted may be kept in heat a few weeks longer, for though theory may say, keep them as quiet as possible, practice, which is a much better guide, says, keep them growing until they are thoroughly established, unless you wish to consign them prematurely to the rubbish heap.

Reserve Garden.—Plants of Wallflowers, Double Rockets, Polyanthuses, Double Primulas, Hepaticas, and other spring-flowering plants that have been growing in nursery beds through the summer, may now be removed to their blooming quarters in the flower-borders. If you can surround them with fresh compost they will gratefully repay your kindness in the spring.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas.—It will soon be necessary that they should be put in their quarters for the winter. Nine tenths of the collections grown in the country are wintered in glazed frames, or sheltered by boards hinged to a wall; the great point, however, is to keep them from drenching rain when the plant is in a dormant state. *Polyanthuses*—May still be planted—the sooner the better. *Tulips.*—All offsets, seedlings, or unhealthy bulbs should now be in the ground; and as the main bed ought to be planted between the second week in October and the first week in November, everything must now be in readiness, and the first favourable opportunity taken of putting them in the ground. In consequence of the late fine weather the beds ought to be in a good state for planting, and it would be a wise precaution to cover them with mats during the night, or on the appearance of rain, as it is advisable not to plant when the bed is too much saturated with moisture. We promised last week to name a few first-rate and splendid Tulips, the price of most being high:—*Feathered Bizarre*, Dickson's Duke of Devonshire; *Flamed Bizarre*, Strong's King; *Feathered Byblomen*, Louis XVI.; *Flamed Byblomen*, Salvator Rosa; *Feathered Rose*, Lady Middleton; *Flamed Rose*, Beteral's Brulante éclatante. These are, comparatively speaking, but in few hands; but they are gems which no good bed should be without. *Dahlias.*—We have now had several sharp frosts: if the precautionary measures advised last week have not been adopted, it must be done forthwith. *Beds for Ranunculuses* should now be prepared, and all compost heaps turned and sweetened; vegetable refuse should be collected and put in heaps to decay.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Those plants which are now in fruit, and those for fruiting next, should have a bottom-heat of about 85°, and a top-heat of from 65° to 68° at night; the day temperature varying according to the brightness of the weather. Supply the plants with water where necessary, letting the water be about the temperature of the bed. Strong plants swelling fruit may still have a little liquid manure with advantage. The night temperature should not exceed 60°, and should be allowed gradually to fall, so as to be about 57° at the end of this month.

Vineries.—To preserve Grapes to a late period is a matter of much importance to every gardener, and to keep them plump as well as free from mould and damp, requires close attention to the state of the atmosphere. In endeavouring to prevent damp, care must be taken not to overheat the house, as this will cause the fruit to shrivel. Where a stock of Vines in pots or boxes have been grown for early forcing, some of them should now be ready for bringing into the house. they should be well washed, and top-dressed if it was done last month. The pots may be placed in any part of the house till the buds begin to break. Fresh, hot dung is the best thing to start them into growth with; it may be laid along the centre of the house in the form of a ridge. Vines will not start at this season at a lower temperature than 50° or 55°.

Peach houses.—In some cases the trees in the house that was second last season will be in the best condition for starting first for next season's crop. Where this is the case let no time be

ost in putting the house and trees in order. Let the lights, rafters, trellis, and walls be well washed, and when dry give them a thin coat of paint or colouring. Dress the trees with a mixture of soft soap and sulphur in hot water: let this be well rubbed in with a sponge. See also to the flues or pipes being in good working order.

Melons.—The best way to obtain Melons of good quality at this season is to grow them in a late vinery, training them up a trellis under the Vines. We have the Cabul treated in this way, now ripening fruit of as good flavour as at any time of the year; as also the Hoosanee has done in former years.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Gathering and Preserving Fruit.—It is better to gather the later Apples and Pears, though not quite ripe enough, than to expose them to much frost, which, though it may render them sooner fit for the table, will prevent them keeping so long, and injure their flavour. All kinds may be gathered as soon as the stalks separate easily from the branches, but as some kinds adhere very firmly, the best criterion of fitness for gathering is to slice a fruit up the middle, and see if its seeds are approaching maturity. Care should be taken to keep all late fruit from light and from air, if it is desirable to keep them long. This should be particularly attended to in the case of those fruits gathered before sufficiently matured, or otherwise they will be disfigured by shrivelling, &c. The season of any favourite Apple or Pear may be prolonged by gathering at different times, and by subjecting the first gathering to a higher temperature, so as to promote the saccharine fermentation. Care should be taken that the increased temperature is not attended with too arid an atmosphere, or the juices of the fruit will be unnecessarily exhausted. Procure a quantity of clean sand, to be thoroughly dried, for packing the best fruit in pots and jars afterwards. Charcoal-dust may be used for the same purpose, after wrapping each fruit in tissue paper. I once knew of a quantity of Apples, and Carrots, &c., being rotted by packing in dry sawdust—the moisture escaping from the fruit, &c., causing the sawdust to heat violently. The fruit cannot be better dealt with at present than by placing them thinly on open shelves. Look after Filberts and Walnuts, and see that they neither become too moist, nor get too much dried, as in either case the kernel will be injured. Few things require more attention than fruit-rooms, as generally they have to be made the general storehouse for everything, such as nets, cloths, seeds, &c. It is to be hoped that the able observations of Mr. Forsyth will be promotive of a beneficial change.

Celery.—Proceed with earthing-up every favourable opportunity. Much good Celery is spoiled at an early season from want of proper attention. To secure very large fine heads of Celery for the first shooting parties in September, I generally earth up at once after being previously tied up, from a fortnight to three weeks before it is wanted for use. If such Celery is earthed-up gradually, many of the best heads will run to seed; if allowed to stand long after receiving its final earthing-up, the centre of the plant will rot. For succession crops, where there is little danger of the plants running to seed-stalk, soak the beds first with water, and then earth up gradually, giving a little at a time, so as not to cover the centre of the plant. Moderate-sized heads answer best for general purposes, but gardeners, at times, must humour visitors by giving them something to look at. Where worms are very plentiful, strew the ground with ashes before earthing-up; or, if you can, put a little around each stalk as you proceed. Quicklime must not be used for this purpose, as, if it lodges in the heart of the plant, it will disfigure it as much as the worms would do. *Routine.*—See former Calendars.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Attend to the directions given in late Calendars.

Coppice.—The above remark will equally apply to this department for the present; it is too early to commence planting.

Young Plantations.—The clearing of ground, taking up dead trees where it is intended to plant fresh ones, inclosing ground for new ones, trenching and holing, should now be forwarded with all possible despatch, preparatory to planting.

Hedge-rows.—Take up dead trees, make holes for fresh ones, and consider what kinds to plant, so as to be the least detrimental to arable and pasture land; but at the same time select the kinds that will be most valuable as well as ornamental; planting should not be performed without due consideration.

Nursery Work.—As soon as the leaves begin to fall off deciduous trees, they may be taken up and laid in by the heels in well pulverised soil, until they can be replanted where they are intended to stand.—*W. B.*

VII.—COTTAGERS' GARDENS.

The taking up and storing away the various winter crops is now the principal thing to be attended to. When that is accomplished let the cleared grounds be ridged, or roughly dug, in order to expose as large a surface as possible to the mellowing influence of the winter frosts. All weeds and vegetable refuse should be cleared away to the manure heap. By this means the ground is rendered much neater, weeds are thus prevented from seeding, and consequently much labour is saved next year. Advantage should also be taken of fine days, of which many can scarcely be expected after this time, to clean every corner of the garden against winter. Let the flower border be stirred up and neatly raked over; remove decaying blooms from Dahlias. If fruit is not already all gotten in, look sharply after it; little will be gained after this time, but much lost, by allowing it to remain longer upon the trees. The best season for planting fruit trees is as soon as their leaves have fallen, provided the soil is sufficiently moistened to admit of the trees being taken up. By autumn planting, trees, &c., get pretty well established in their new situation before winter; they are thus better able to stand the cold easterly winds in spring and are ready to commence growing upon the first approach of fine weather.—*J. M'H.*

State of the Weather near London for the week ending Oct. 10, 1844, as observed at the Horticultural Garden, Chiswick.

Oct.		Moon's Age.	Barometer. Max.	Min.	Thermometer. Max.	Min.	Mean.	Wind.	Rain.

The highest temperature during the above period occurred on the 14th, 1834—therm. 71°; and the lowest on the 19th, 1843—therm. 22°.

Notices to Correspondents.

Asphalte Covering.—*S.*—This was found to exclude completely the rain from a Vine border; and, with a little straw under it, there is no danger to be apprehended from frost. In excluding cold rain and melting snow, borders must not, however, be allowed to get too dry. As affording protection from wet, Asphalte is preferable to a double mat for covering plants; but it requires to be fixed on frame-work.‡

Books.—*G. W. G.*—Mr. Hoare's work does not treat of Vines under glass. Take that by Mr. Roberts. Glendinning on the Pine-apple will suit you best.

Clianthus puniceus.—*The Cid.*—If your plant is attacked by green-fly, fumigating with Tobacco will certainly destroy them; but in such a season as this has been, it is more likely to be red-spider (which causes the leaves to drop off), on which Tobacco smoke has no effect. It is a plant which will not bear much cutting in autumn, especially in cold weather, therefore you had better defer cutting it down until spring.§

Chrysanthemums.—*The Cid.*—Cut down any plants of these that are too small to flower this season, and keep them in a cold frame until spring. Much better plants will be obtained from spring cuttings than by dividing the roots. See p. 876, vol. 1843.§

Foresting.—*J. M. F.*—Never give manure to Fir-trees, or indeed any kind of Coniferous plants. The non-resinous trees will bear it, and Oaks or Spanish Chesnuts will do the better for small quantities; but the best preparation for all forest-trees is a thorough loosening and pulverisation of the soil; to which may be added the ashes of all refuse, such as weeds, burnt upon the ground. A little super-phosphate of lime, sprinkled over the roots when planted, has been found to quicken the formation of new fibres.

Fruit-trees.—*Farmer.*—You may apply the strongest liquid manure from the farmyard, or elsewhere, with great advantage to Pear and Apple-trees if you mix it with plenty of water.‖

Guano.—*M. W. K.*—The rod, imperial measure, of 30¼ square yards is that understood, and for which 4 or 5 lbs. was recommended. Well diluted, it may be applied either before the ground is cropped, or when the plants are a little above ground.‖

Heating.—*Albert.*—Certainly. You will have ample top-heat with such pipes. Do not even run your flue inside your house. It is to be feared that your bottom heat may be insufficient, and you had better let the pipes employed for that purpose double back, so as to increase the heating surface. You must have moisture, and you may make shift with lead or zinc troughs, but both those metals are objectionable, because of their softness, especially when heated. Your boiler will do very well.

Hyacinths.—*L.*—Hyacinths which have been grown in pots in the usual way, may be removed into glasses when the flowers begin to show colour. The bulbs should then be gently shaken from the soil, the roots washed in luke-warm water, and placed in the glasses, which should be filled with water of the same temperature.‡

Insects.—We must beg our correspondents to send us specimens with their queries, and living ones of larvæ if possible, in order that we may rear them to study their economy. It is impossible to tell the owner of the *Beurré Diel Pear* tree what his larvæ are without seeing specimens. *R.*——*Silex.*—The best means of getting rid of house crickets is to take some bread, sweeten it with sugar, and add to it some oxide of arsenic, then place portions of it wherever the crickets congregate; but as it will poison any animal it must be carefully used. *R.*——*J. B.*—Your live caterpillar arrived safe. It is the larva of the Death's head Hawk-moth, Acherontia Atropos, whose history with figures you will see in Curtis's Brit. Ent., fol. and pl. 147. *R.*——*F. H. S.*—Cynips lenticularis, or an allied species, causes the Oak-spangles and you will find an account of them in the 3d vol. of the *Gardeners' Chronicle*, p. 52. *R.*——*R. W.*—We beg you will transmit Mr. Curtis specimens of the flies in a quill. The fever could not produce them; and if you burn sulphur matches, or brown paper previously washed with sulphur, upon a piece of old wire sieve, laid over a flower-pot, it will suffocate the flies: but the doors and windows must be made as air-tight as possible, and if the pot be placed in a large dish or tin, no danger need be apprehended. All picture-frames, &c. must be removed to avoid being tarnished. As Hayes is not within the limits of the two-penny post, it is necessary that communications should be sent to Mr. Curtis *before* Wednesday, where an immediate answer is desirable. *R.*——*P. R.*—Your Datura is infested with Aphides: the application of Tobacco smoke will extirpate them. *R.*——*C. McGregor.*—Your quill contained no beetle nor anything that we could find, excepting a minute portion of dried vegetable. If you will oblige us with sufficient materials we will with pleasure investigate the subject. *R.*——*J. C. M.*—I should like much to receive living specimens of your Palmer-worm, as it is very desirable to breed all the noxious insects. The maggots attacking your Cabbages you will find figured and described in the 4th vol. of the Royal Agricultural Journal, p. 128, and pl. H. fols. 32 and 33. *R.*——*Anon's* female Ichneumon is named Pimpla instigator, *vide* Curtis's Brit. Ent., fol. and pl. 214. It is useful in keeping under the larger hairy caterpillars in gardens, by depositing its eggs in their bodies. *R.*——*Bufo.*—We will consider your plaintive notes, and endeavour to sing in praise of your ill used race.

Melons.—In a frame only 3½ feet wide, with three plants under each light, you could not have had much fruit.‖

Morphology.—*A Constant Reader.*—Your plant is no illustration of this subject, but a specimen of common purslain, the seed of which has been mixed with Port. Thellusonii, &c.

Names of Fruits.—Some of our correspondents are unreasonable. We are willing to name doubtful specimens of fruit, to a moderate extent; but we cannot sit down to give the names of scores of things which everybody ought to know. ——*A. C.*—Has just sent a box of 35 kinds to be named, and we must put a stop to such merciless demands upon our time.——*Veribus.*—1, 2, Brown Beurré; 3, 7, Old Colmar; 4, Buchanan's Spring Beurré; 5, Spanish Bon Chrétien; 6, Beurré de Capiaumont; 8, 12, Marie Louise; 9, 10, Flemish Beauty; 11, Grout Morceau.‖

Names of Plants.—*T. C.*—Stanhopea Lindleyi, a variety of S. oculata.——*J. B.*—Both varieties of S. graveolens.——*G. J. Dale*—Oncidium concolor.——*W. K. P.*—1, Rhipsalis grandiflorus ?; 2, Mammillaria suberocea: 3, Epiphyllum alatum; 4, Rhipsalis salicornioides; 6, some Opuntia; 8, Euphorbia polygona; 9, Mammillaria pusilla; 5 and 7 are indeterminable.‡——*C. C.*—Quercus Phellos.¶

Pear-trees.—*Farmer.*—The following varieties are most likely to succeed on a high situation:—Aston Town, Knight's Monarch, Althorp Crassane, Passe Colmar, Bacon's Incomparable, and Ne plus Meuris. On such a situation they will succeed best trained in the dwarf form. As your ground is rather heavy, it should be well trenched and manured with farmyard manure, mixing it well with the soil. To plant a tree properly you have only to spread its roots a little sloping, and so as not to be much below the surface when covered with soil, made sufficiently fine for closing about the roots on immediate watering.

Plants.—*F. H. S.*—The following are good greenhouse plants, viz.:—Veronica speciosa, Chorozema varium nanum, Pimelea spectabilis, Hovea pungens, Leschenaultia grandiflora, Mirbelia dilatata, Statice Dickensoni, Tropæolum azureum, Tetranema mexicanum, Habrothamnus fasciculatus, H. cyaneus, Boronia crenulata, Eriostemon buxifolium, Gompholobium versicolor, Tecoma jasminoides rosea, Echeveria secunda, and Hardenbergia macrophylla. The following are suitable for a stove:—Achimenes picta, Achimenes longiflora and Achimenes grandiflora, Clerodendron infortunatum, Aphelandra cristata, Ixora coccinea, Eranthemum pulchellum, Euphorbia splendens and E. jacquiniflora, Franciscea uniflora, Gloriosa superba, Gloxinias, Ipomœa Horsfalliæ, Justicia picta and J. speciosa, Rondeletia speciosa, Russellia juncea, with the different kinds of Thunbergias. The best soil for potting Hyacinths in is good sandy loam and leaf-mould in about equal portions. ¶——*A Subscriber.*—The time when the following plants flower, if treated in the ordinary way, and not forced or excited by any artificial means, is as follows:—Jasminum revolutum, June and July: it lasts in bloom about a month; Rhododendron caucasicum album, August, 2 weeks; R. c. arboreum, April, do.; R. chamæcistus, April, do.; R. Nobleanum, April, do.; and R. pulcherrimum, April, do.; Rhodora canadensis, May, do.; Sternbergia lutea, October, 1 month; Berberis empetrifolia, May, 2 weeks; B. (nervosa) glumacea, March, 3 weeks; B. Aquifolium, March and April, do.; B. dealbata, May, do.; Andromeda Catesbæi, June and July, 1 month; Camellia, single and double (open air), April, 3 weeks; Thea viridis, August, 1 month; Althæa frutex, September, 3 weeks; Daphne mezereum autumnalis, October, 1 month; D. neapolitana (various), June, do.; and Fritillaria præcox, March, 2 weeks. The duration of blooming depends greatly on what kind of weather there is at the time; if moist they will last much longer and later, but if dry or cold much shorter. ¶

Potatoes.—*A.*—Chapman's Potato, planted early in spring, is a good Kidney for a supply between the earliest varieties and the American Natives.‖

Primula sinensis.—*The Cid.*—It is very probable that your plant has been attacked by some insect. It will succeed best in a cold pit in summer, where it can be shaded and sheltered from heavy rains. Young plants will be apt to damp off in a cold frame in winter.§

Walnuts.—*Nutworth.*—To preserve these effectually, requires some care. They should be allowed to hang upon the tree until the outer covering begins to crack; in this state, when the tree is beaten, many of the Walnuts as they fall will roll out of the husk. These should be gathered into a basket separate from those that retain their covering; the latter should be laid aside for a few days until the husks burst, and they can be taken out with care. The great object is to prevent them from becoming mouldy; they should, therefore, be wiped clean and dry, and laid on a shelf in a dry place where they can have a free current of air until all tendency to mouldiness is overcome. Great care must, however, be taken that they are not over-dryed, for that will cause shrivelling. When sufficiently dry, they should be put into boxes in layers alternately with bran, fine dry sand, or shreds of cloth, and kept for use in a cool dry situation. By this means they will retain their moisture and flavour, and the film will with ease peel off.‡

Miscellaneous.—*G.*—The fruit of Pyrus japonica is unfit to eat, because of its austerity, but not for any other reason. It is, in fact, a sort of Quince——*Z. Y. X.*—The cheapest preparation of copper which you can obtain is the sulphate. If used in sufficient quantity it will prevent the growth of weeds, but it will be an expensive remedy. Labour, constantly and skilfully applied, is by far the best and cheapest remedy for weeds. ——*N. A.*—Gesnera zebrina naturally dies down when it has done flowering, after which it should be kept dry until the month of March. Cereus speciosissimus will flower in a conservatory border, providing it can be kept dry during winter.§ ——*Delta.*—Directions for preserving Pelargoniums over winter are given in last week's Paper, p. 672.‡——*M. W. K.*—No. 1 is considered a first rate flower; the best of the purples. 2, crimson, a good show flower; 3, rose, free bloomer, with large trusses; 4, singular in colour, but not good in form.*——*O. H.*—You will find much information respecting the management of Fuchsias given by Mr. Wood, in former numbers of the present year. Pelargoniums like a rich light soil. Respecting their winter treatment, see our Calendar of Operations in to-day's paper.‡——*O. P. Q.*—Mr. Paxton is of opinion that the manner in which the conservatory at Chatsworth is glazed is a great improvement on the old method of glazing.‡——*A. B.*—We do not understand your question.‡ ——*W. S.*—We cannot decipher such Chinese names; seeds are not worth cultivating.‡——*Reverteus*—A Pear can be grafted on a Crab or Apple-tree, but it will not stand long. The time for introducing Strawberries into heat varies according to the month in which the fruit is wanted; if wanted early, they should be put under glass before December. Allow the crowns of your Pine-apples to lie on the surface of one-a bark-bed for a few days, then pot them in a mixture of one-third loam and two-thirds of half-decayed leaf-mould, in which they will root very freely; afterwards plunge them in a frame, but not in too much bottom-heat, for that will injure the roots. Pelargonium-seed of this year's saving, as well as that of Roses, will probably grow if sown next spring. Plant your Vines inside the house. The long-rod system of training looks neatest in a greenhouse.‡——*J. H.*—It is not at all unusual for Orchidaceous Epiphytes to form fruit; if you set their flowers they generally do so.——*X. Y. Z.*—If you have no agent or correspondent at New York to whose knowledge of such business you could trust, you had better consult your solicitor, who, if he lives at your port, probably may have. *W.*

SEEDLING FLOWERS.

Fuchsias.—*R. S. J.*—The larger variety is the better of your two seedlings, and though large and showy, the tube and sepals are coarse, and possess too much colour.*——*B. B.*—None of your seedlings are equal to the sorts in cultivation; No. 3 is the best, but the tubes and sepals possess too much colour.*——*G. C.*—Your seedling is a very pretty variety, but it depends upon the habit of the plant whether it is a variety worth cultivating.*——*G. S.*—The darker seedling of the two wants novelty of colour to recommend it as a variety for general cultivation: it is pretty in form, but in its general appearance too much like many already out. The light variety is a very stout flower, wanting a deeper corolla; tube and sepals delicate vermilion, the latter tipped with green; corolla vermilion also, rather deeper than the tube.*——*W. J. C.*—Your seedling is a pretty little flower, singular in form, and appears to be a most prolific bloomer.*——*W. J. E.*—Your seedling is a very pretty and striking variety, and deserves a place in every collection; there is a slight tinge of pink in the tube, which changes to white in the sepals, and these, which are long and expanding, terminate with green points; rosy purple corolla; flowers of moderate size.*——*E. S.*—The light variety wants more colour in the corolla; this part of the flower has too faded an appearance. No. 2 is a fine rich-coloured variety, very much like but inferior to *T. Exoniensis.**——*Anon.*—2 blooms in a letter. The sepals are too long, and there is rather too much colour in the tube. It resembles many we have seen this season.*——*O. P.*—The seedling Fuchsias you have sent are merely repetitions of sorts that have been some time in cultivation; the best among them is No. 4, being large, clear, and brilliant in colour; but they all resemble sorts in cultivation*.

Pansies.—*Amateur.*—Your seedling is a very pretty variety, beautiful in colour; but a similar flower of greater substance, and with a stronger marked eye, is already in cultivation, named *Welche's Blue Perfection.**

Verbenas.—*J. H.*—The lighter variety, a delicate rose, is very large, and from its appearance is of greenhouse cultivation; it is a good variety, but we prefer the smaller flower, which is very brilliant in colour, and appears less liable to fade; it it is also less common in colour than the larger one.*——*W. H.*—Your seedling is a fine variety, the flowers are large, and form a fine truss of a soft, rosy-red colour.*——*A. A.*—Your seedling is not equal to many of the same colour at present cultivated.*

EDINBURGH VETERINARY COLLEGE.—The COMMITTEE of the HIGHLAND and AGRICULTURAL SOCIETY of SCOTLAND, appointed to superintend the Veterinary College, hereby intimate that PROFESSOR DICK will commence the COURSE of LECTURES on VETERINARY SURGERY and MEDICINE, for the 22d Session, on MONDAY, the 11th of NOVEMBER next. The Course will comprehend, as usual, instruction in the Anatomy, Physiology, and Pathology of the Horse, Neat Cattle, the Sheep, the Pig, and the Dog, including, also, Stable Management and the Forge; and, in order to the arrangement of the several departments of study at hours convenient for the Students, the Professor will have the assistance of Messrs. BARLOW and WORTHINGTON, Veterinary Surgeons, who, under his superintendence, will take charge of the Anatomical Demonstrations, Materia Medica, and Pharmacy. The necessary instructions in Chemistry, in connexion with the course, will be given by Dr. WILSON, instead of, as formerly intimated, by Dr. FYFE, who has been appointed Professor of Chemistry in King's College, Aberdeen.

By order of the Committee,
CHARLES GORDON, Secretary.

Highland and Agricultural Society's Hall,
Edinburgh, 4th October, 1844.

The Agricultural Gazette.

SATURDAY, OCTOBER 12, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Oct. 17—Agricultural Imp. Soc. of Ireland.
THURSDAY, Oct. 24—Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.
Oct. 21—Wenlock, Fairford.
Oct. 23—Framlingham, Rayleigh.
Oct. 24—Richmondshire, Grove Ferry, Blofield and Walsham.
Oct. 25—Debenham, Stoke Ferry, Hadleigh.
Oct. 26—Gloucester.

WE are not aware that the advocates of the ALLOTMENT SYSTEM have had to contend with much active public opposition in the arena of argument. In endeavouring, however, to carry out their plans they have occasionally encountered an adverse feeling, more especially among farmers, which appears to be based on a misconception of the nature of the allotment system, and of the effects which it is calculated to produce on the labouring class. Farmers have been found to oppose its introduction on grounds such as these:—If a labourer works for his master during the usual hours of the day, and does his duty towards him, he will have neither time nor strength to expend in the cultivation of an allotment. To give him such an allotment is to place that in his way which will tempt him to deprive his employer of a portion of the time and strength he is entitled to expect from him; besides this, it will make him independent of his employer, and he will become a saucy and a bad servant.

Whether the labourer is in a position to cultivate an allotment should be considered in each individual case before the allotment is granted—the labour which his wife and family can give being taken into account. There are classes of labourers—waggoners, for instance—who have to devote all their spare time to the service of their employer; but if a man even in this position has a family capable, with occasional hired assistance, of cultivating an allotment, we see no objection to his possessing one. The general class, however, of day-labourers working 12 hours per day are able, where they have families to assist them, to cultivate an allotment of land, without any neglect of their duty to their employer. In proof of this, we refer to the evidence which we have already adduced. And will the possession of an allotment make the labourer independent of his employer, so as to become a saucy and bad servant? Read the evidence contained in our two previous Articles. In the first case quoted, 30 families were provided with 29 acres of allotment land—nearly an acre to a family. What is the result? "The tenants and their families have been rendered all honest and respectable; *they have been kept entirely free from parish relief, and become the farmer's most steady and industrious labourers.*" Look at the case of Long Newnton, Wilts. The rates paid in six months, from October, 1820, amounted to 208*l.* 6*s.*; while those for six months, from October, 1823, after the introduction of the allotment system, amounted to only 4*l.* 12*s.* 6*d.* "The labourers were reclaimed from idle and bad habits, and became most valuable servants."

The labourer possessed of an allotment would be more independent than at present, it is true, and of many of the benefits which the allotment system can confer, this independence is the source. The man ceases to live from hand to mouth. If thrown out of work for a short time, he is not reduced to the brink of starvation, nor driven to the parish for relief. Such independence as this it is desirable and right, whether in a moral or a physical point of view, that the labourer should possess; but if the labourer still depends on wages for his main support, he cannot be independent of his employer. Indeed, every class and every individual in the community are reciprocally dependent; and this is a wise and beneficent arrangement.

We may safely believe, and act upon the belief, that the allotment system, where properly regulated, is beneficial to masters as well as labourers. The best method of effecting its general introduction, and of promoting its beneficial operation, will be considered next week.—*F.*

IN the course of our REMARKS ON THE PLOUGH, we do not at present intend to enter into any detailed statement of the considerations which should determine the merits of its various forms; this branch of the subject will be more suitably taken up hereafter in another section of our Paper; our present object is merely to impart a general idea of the character of the implement as now used in various parts of the kingdom.

It would serve no useful purpose to enter here into any antiquarian detail. The form of the plough in ancient times, much resembling that in the less civilised parts of the world at the present time, is described with sufficient minuteness by Mr. Ransome in his excellent work on Agricultural Mechanics, to which we have already alluded. We are indebted to the kindness of that gentleman for the following figures from his volume, which, without further remark, are sufficiently indicative of the inefficient form of the implement with which the unskilful agriculturist was then satisfied.

ROMAN PLOUGH.

CHINESE PLOUGH.

The following figure of a plough, taken from a Saxon Calendar, exhibits an improved construction. The mould-board, coulter, and wheels are much the same as those which are still used in many districts.

SAXON PLOUGH.

Ploughs may now be divided into those with fixed mould-boards, and turnwrest ploughs; and into those with wheels, and swing-ploughs. By much the greater part of our arable land is still cultivated with implements having fixed mould-boards. Turnwrest ploughs, by which, as a slight consideration of their construction will show, the furrow-slices are all thrown one way, are not suited for naturally wet and undrained lands. Such lands as are not thorough-drained require to be ploughed into ridges, so as to insure a surface drainage. Of the fixed mould-board class accordingly we have the greatest variety, suited—we do not say to our various kinds of arable soil, for variety in this, however great, would not justify the extreme variety which exists in the form of the plough—but suited to the custom and perhaps the prejudices of the several districts of the country.

The following figures exhibit some of these implements:—

SCOTCH PLOUGH.*

BARRETT AND EXALL'S, A. 5, TWO-WHEEL PLOUGH.†

BARRETT AND EXALL'S, D. P. ONE-WHEEL PLOUGH ‡

BARRETT AND EXALL'S TWO-WHEEL OR SWING PLOUGH. §

We hope on a future occasion to be able to state the comparative draught of some of these implements in executing a given quantity of work on various soils. The following are figures of two of

* Price 3*l.* 10*s.* to 5*l.* † Price 4*l.* 10*s.* ‡ Price 3*l.* 3*s.* § Price 4*l.*

four varieties of turnwrest plough in use; the one, and the other, such as Mr. Smith, of Deanston, common in the south eastern counties of England, recommends on well-drained land.

Smith's Turnwrest Plough.

Improved Kentish Turnwrest Plough.‡

Besides these, two other forms of the turnwrest plough were mentioned in our report of the Implement Yard at Southampton:—Lowcock's, a very ingenious and easily-managed implement, exhibited by Messrs. Ransome; and an exceedingly simply constructed plough exhibited by Mr. Comins, of South Moulton, Devon, descriptions of both of which will be found at page 513.

We have still two contrivances to mention connected with this implement; the one here figured, which is suitable on light soils where less than the power of two horses would be sufficient to draw an ordinary plough through the land, consists in uniting two implements together, so that a team of three horses, or perhaps of two strong ones, may turn two furrows at once.

Double Plough.¶

The other matter to be mentioned is a mode of construction adopted by some makers, which, it would appear from the experiments on the draught of ploughs, by Mr. Pusey, as reported in the English Agricultural Society's Journal, is well calculated to diminish the power required to work the implement. This consists in the substitution of a wheel for the sole-plate of the plough; the friction on which—owing to the weight of the implement, which it appears is the cause of a considerable portion of the draught—is thus to a large extent diminished. The following figure exhibits the simplest and also the oldest of the modes of construction on this principle.

Wilkie's Friction-Wheel Swing Plough.

It will be seen that our object in the above very general remarks is simply to place on record a description of the plough as it is at present constructed and used in this country. The merits of the various forms of it, and the considerations on which these must respectively be determined, will afford materials for several future Articles in another section of our Paper.

THE ANOMALIES OF AGRICULTURE.

If there be upon this earth a pursuit—a practice, an art—call it what you will, of which one may at once with courtesy and truth say it is "as old as Adam," that art is the cultivation of the soil; or, to speak more like an honest Saxon—farming. It dates from the fall; it was the first fruit of the taste of the forbidden fruit. It is the proper biography of man, for it is coeval with the existence—nearly co-extensive with the spread of the human family upon earth. Born the child of sin and sorrow, it grew up the parent of good and of happiness; pronounced as a curse, it has insured a blessing. It is, as it were, the natural condition and obligation of man, in all ages and in all parts of the earth; and, could we indeed trace and follow out its history, it would probably be the most pregnant, the most real history of the human race. Adam and his children, Noah and his sons, the Jewish patriarchs, were all farmers. The heroes of Homer and of Hesiod, equally at home in the field of swords and ploughshares, settled all accounts in stock—not Government but agricultural—stock proper. Their *modus estimandi* of a warrior was by his flocks and herds; and their grandest religious ceremony—the Hecatomb—must have been a perfect Smithfield Show. Theocritus, and the pastoral poets after him, were so many flock-masters. Cincinnatus among the ancient, Virgil, Horace, Cicero, and Pliny, among the more modern Romans, were all farmers. In a word, from the days of Adam to those of John Robinson*, and from him to the noble reigning triumvirate, Richmond, Spencer, and Ducie, farming has held up its head in the world as high as its most devoted panegyrist could wish to vindicate.

* George the Third's farming soubriquet.

Is it not, then, a something to wonder at, even in these latter days, when wonder itself is grown threadbare and out of fashion, that agriculture, being such, of human arts the elder brother, the most universal, the most necessary, should in this ignorant present time, to wit in the fifth decade of the 19th century, be of sciences the youngest and the last-born, not yet out of its swaddling clothes—and what swaddling-clothes! Prejudice wrapped over Ignorance, and a veil of thick and stupid mystery over all; as if the closer gaze of that which to know fully must be the most valuable and precious of all physical knowledge were a boon too rich and rare for thankless man. And yet, in plain and sober seriousness, can this be denied? Take the ordinary English farmer of 100, 200, or 300 acres; ask him the simplest question that can be put to a child, about any one branch of any one of the sciences upon which his whole practice is founded, and upon which his livelihood depends; take him to his dunghill, and ask him the meaning of decomposition; take him to his fresh-sown field, and ask him about germination; show him a field in broad leaf, and ask him the history of vegetable nutrition; ask him any one of these questions, or, if you can think of i ,something more simple and elementary than either. He is a professed dealer with Nature; he ploughs, manures, and limes; he sows and reaps; he is the autocratic director of every operation on his farm, mechanical and chemical. Surely if science be not all a lie, and the analogy between the laws of one human pursuit with another a delusion, he should be something beyond a mere empiric; he should have some conception of the great laws and principles which he puts into force; the engineer should know something of the engine. What does he know? About as much as a soldier in the ranks, of the plan of a campaign; about as much as the foretopman of an Indiaman, of the position of his vessel from the occultation of a satellite of Jupiter; probably less than either of these. But I am told, in answer to this, that of late years there has been much improvement; that this state of things is passing away; that already the farmer (such a one, at least, as you would accept for your tenant) is an improved existence; that example farms, agricultural colleges, and schools of chemistry, are multiplying over the land; that the very technical terms of chemical lore are beginning to be heard at farmers' ordinaries; till the most fastidiously scientific appetite is beginning to pall, even with the food that pleased it best. This is indeed true enough; and away with the miserable conceit that, standing on the vantage-ground of a luckier education, would throw one jeer or permit one ill-placed smile to creep out at the infant efforts of however adult a mind, if the tendency be in the right direction. What if Farmer Dobson did think last year that ammonia was "the name of a gentleman's daughter?" He knows better this year, and next year we shall hear of his putting sulphuric acid to his dunghill, to seize this fair lady as she flies. Why should he be expected to be a ready-made chemist? When he was a boy, chemistry was scarcely born. He had no education in chemistry. How should he know anything about it, or that it had any more to do with farming than the Egyptian hieroglyph? He is not the person to be blamed. The blame, if anywhere, lies with those who advance it—namely, with the scientific world, who have allowed the physical world to grow nearly six thousand years old, and have only just made the notable discovery that the science of all nature—chemistry—is eminently and necessarily applicable to the art of all existence—farming! I say it is the backwardness and infancy of science, not the ignorance of farmers, that deserves reflection. Which of these three propositions is the more wonderful, that Jethro Tull should have made the discovery that pulverisation was the great secret of mechanical cultivation; or that Humphrey Davy should have first thought and lectured upon chemical cultivation; or that both these great secrets were not put into words till the surface of the earth had been tilled for upwards of 5700 years! It is true, Wheat has been sown, as well as "blood spilt ere now in the olden time;" and sooth to say, God's earth has been well enough manured by the one, to account for some extra luxuriance of the other. Lean stock has been made fresh, and fresh stock fat; yet around these simple-seeming operations, a veil of ignorance, of blindfold and gregarious empiricism has hung, to be torn aside by the magic touch of Davy first, in England, and after a pregnant interim, by Thäer and Liebig in Germany, Boussingault in France, Johnstone in Scotland, Buckland and Daubeny at Oxford, Henslow at Cambridge, and Playfair in London. And at the heels of these champions of agricultural Christendom, a host has gathered that promises to scare Prejudice herself from her favourite and oldest haunt; and strange to tell, the occupation that has hitherto been deemed "of the earth, earthy," dull, heavy, and changeless, stupidly laborious and mechanical, fitted only for the hard hands of peasants, and the unlettered scull of the hind and serf, receives at one blaze its brilliant illumination, and is all at once found to be associated with the profoundest discoveries, and dependent upon the most delicate and recondite investigations of physical science.—*C. W. H.*

(*To be continued.*)

GEO-AGRICULTURAL NOTES OF SOUTH GLOUCESTERSHIRE.

(*Continued from page* 611.)

Coal.—The coal strata, which next engage attention, do not follow the same law of conformity which those hitherto described have exhibited. The strata of the new red sandstone overlie them in a manner different from that in which the former are overlaid by the lias. In the latter case, an entire bed of the one rests on an entire bed of the other; but in the former, the new red strata rests on the edges of the coal strata; these must, therefore, have been raised up and worn away during the interval elapsing between their deposition and that of the strata covering them. The boundary of the coal district is easily traceable by Itchington, Cromhall, Wickwar, Sodbury, Waterleigh, Homapple and Stonehill, Hanham, Keynsham, Brislington, Stapleton, and Winterbourn, inclosing a space of about 40 square miles. The greater portion of this boundary is the junction of the coal strata with those of the new red sandstone, which overlie them all round the southern edge of the basin. In the north of the coal district, its boundary is its junction with the mills'one grit, which dips on all sides below it. Very few beds of coal occur in the northern part of the district, and these are of very inferior quality. Over almost the whole of the district, the prevalent rock is a siliceous sandstone, which, where coal abounds, alternates in thin layers with it, and with beds of clay and sand; but where coal does not occur, it forms extensive strata of most excellent building material. It is of a blue colour, but varies much in its texture. It is much quarried as a building stone, being the best, though not the handsomest material for that purpose in the county. It is also much used as a tile and paving-stone.

Agricultural Character of the Coal.—The poorest land in the county occurs on the clays of the coal formation near Cromhall and Rangeworthy. A great proportion of this land was lately in commons and waste, and perfectly worthless. They were overrun by Heath, Whins, and Brambles; and being in general very wet no valuable Grass of any kind grew on them. The inclosed land is chiefly in pasture, which, in consequence of

extreme wetness, is not good. The fields are not large and the hedge-rows are crowded with the Oak and the Elm. Neither the arable nor the pasture-land are drained. There is no general rotation adopted; the land is cropped as it will bear it. The average crop of Wheat does not exceed two-and-a-half quarters; that of Oats cannot be put at more than 28 bushels. Very few Turnips are grown. The soil on the sandstone of the coal measures is a sandy clay—light when dry, but clinging together when wet. In some places, when near to the rock, it is brashy. It forms a good Barley soil, and good crops of Wheat are raised from it. There are few commons on it, and these are greatly more valuable as commons than those on the clay. About three-fourths of this district are in pasture, which is of good quality. Very little of it is drained. There is rarely any regular system of cultivation followed on the arable land. The centre of this district is crowded by a large population of colliers and others engaged in the coal trade, and the land is divided and subdivided among a great number of holders. The farms are very small. Wheat and Potatoes are the chief crops. Barley and seeds are grown occasionally. The average Wheat-crop per acre is below three quarters; that of Barley is about four quarters. The crop of seeds, after being mowed and depastured during one year, is broken up for Wheat or Potatoes in the next. The system of breaking up seeds for Potatoes is very common.

Millstone Grit.—This is the name given to the rock on which the coal strata lie. It is a siliceous sandstone, varying considerably in its texture: it incloses and forms the coal basin, dipping under the coal strata on every side. It extends from Itchington, where it is overlaid by the red marl, by Tytherington, Cromhall, and Wickwar, to Chipping Sodbury. This band is nowhere above half a mile in width: it is about 10 miles in length. Beside this, which is the greatest extent of the millstone grit, it occurs in the midst of the coal strata, dipping to the north and south, and forming a ridge against which those strata lie on either side. At Bristol it again makes its appearance: Brandon-hill consists of this rock. It occurs again at Almondsbury, in junction with the mountain limestone. A very small extent of it, however, is here exposed, being almost immediately covered up again by the lias clay. It occurs also at Doynton, where its junction with the mountain limestone is again exposed, the coal strata being, however, obscured by the red marl and blue clay. The country has been here curiously broken up by a fault, so that on crossing from Wick towards Doynton, up the ravine between the two places, we pass first over a tract of the millstone-grit, then over one of mountain limestone, again over a tract of a siliceous rock precisely similar to that first passed over; and in the bed of the river by Doynton, and in a small quarry near it, the mountain limestone again occurs dipping at an angle of at least 60°. All these rocks dip one way—slightly to the south-west. The only mode in which their appearance in this manner can be explained is, by supposing a fault to have taken place across the strata in the line of their strike. The millstone-grit varies very much in its texture. It is, at Kingsweston, a very soft sandstone; at Bristol it is very hard; at Wick it is a coarse conglomerate; at Cromhall, again, it is a hard siliceous sandstone, resembling that at Bristol; while, at Sodbury, it is a splintery rock in which the granular structure is entirely effaced.

Near Sodbury, Yate, and Wickwar, beds of strontian occur, overlying the millstone grit. I obtained some specimens in which fragments of the rock were imbedded in the material of the mineral, and which, on being taken out, left their impression, as if they had been enveloped when in a soft state. This mineral is not made use of, except in some instances, when pounded down as a finish to gravel-walks, over which it is strewed.

Agricultural Character of Millstone Grit.—The surface of the millstone grit is generally level and uniform. About three-fourths of it are in pasture. The fields are frequently much overshadowed by hedgerow-trees. The Elm is the tree which is natural to the soil. The pasture-land, beside being soured by the shade of trees, is very easily injured by dry weather. It is frequently very shallow, and is then easily burnt. Perhaps an average crop of 18 cwt. of hay per acre is mowed from it. The soil is generally a keen sand, and, where it is shallow, is full of the angular fragments of the rock. Near Sodbury it is a clayey soil, owing, probably, less to the disintegration of the rock, which is here extremely hard, than to that of the seams of clay by which it is separated.

The general rotation followed on the arable land is a four-years' course; 1st, Wheat, 2d, Barley, 3d, Seeds, 4th, Potatoes. It is a very general practice to leave the crop of seeds out of the rotation, and thus reduce the course to one of three years' duration. This makes it, on a sandy land, a very severe rotation, and under this system it is accordingly found necessary to fallow land occasionally. The average of the Wheat crop is less than three quarters, that of the Barley crop about three and a half quarters. Turnips are sometimes grown instead of seeds, and the average crop is probably less than 10 tons per acre. Lime is much used on this land. It is spread over the soil once in three years, at the rate of 80 or 90 bushels to the acre. It is said to do it good each application. Nothing but the farm-yard manure is applied to the crops, and the dung dropped on the pasture land is generally gathered together and placed on the arable land. No bone-dust is used for the Turnip crop. Indeed, it is nowhere generally used in South Gloucestershire.—*M. S.*

THE LUXURIANT-POTATO FAILURE.

We have had complaints without number of the failure of Potato crops, owing to the sets perishing by dry rot, wet rot, &c., but the sort of failure which your correspondent "R." laments, in a late Number of the *Gazette*, and on which he asks your advice, we have not heard so much about, though I believe it is not uncommon, especially in small gardens.

I shall never forget one of these luxuriant failures coming under my notice when a lad. I had observed, when the early Potatoes were dug up, that wherever there was a plant with two or three good strong stems it was sure to afford Potatoes of a larger size than usual; and when I afterwards saw a crop where all the stems were large, I naturally concluded that the produce of Potatoes must be large also. I accordingly ventured to congratulate my grandfather on the abundant crop he was likely to have, the tops being nearly as high as myself; when he puzzled me much by saying that I was sadly mistaken, for they were all running to tops. How the Potatoes could run to tops I could not imagine; but in after years I fancied I had found a satisfactory explanation of the mystery, and I send it in the hope that it may be of use to "R." The sort of Potato of which I speak was a very valuable intermediate variety, known in North Lancashire as Lord Morris, or Murray's. It was a vigorous grower, and the deficiency in the produce I believe was owing to the ground being too highly manured (for a very powerful manure was used), and to the rows being much too near each other. "R." does not mention the distance at which his Potatoes were planted, but he does say the tops were magnificent—finer in many parts than he ever saw; that the ground was well manured with stable-dung, in many places with Potter's guano, and frequently watered with liquid manure, of human urine and soap-suds. The season cannot be to blame, as he suggests, for upon the whole it has not been unfavourable for late varieties; besides, we should have heard much more of it if the evil had been general. There can hardly be any doubt, in my opinion, that the frequent application of liquid manure was the cause of the mischief. Plants, as well as animals, may have too much of a good thing—they may be overfed; and it is an every-day observation that excessive luxuriance is opposed to fruitfulness. Facts in abundance might be mentioned in proof: I will state one. Col. Le Couteur, in his experiments with manures on Wheat, found that one application of liquid manure was injurious, but some Wheat to which liquid manure was a second time applied, grew so rank and full of leaves, that only a few plants produced ears, and the grain was worthless.

One of the most visibly bad effects of an excess of manure, especially of liquid manure, on Potatoes, is, that owing to their luxuriance, the stems are more brittle, and are much more liable to be laid by winds and rain, than if their growth had not been so rapid.

If your correspondent is aware of the functions of leaves, he will readily see the evils of this. Leaves are most important organs, and their use can hardly be too often explained and illustrated. All the matter which constitutes the Potato is prepared or elaborated in the leaves by the action of light, and consequently the produce of a plant must in a great measure depend on the quantity of leaves which it can expose to the light. If, then, by a too luxuriant growth, many Potato stems are laid, a considerable number of leaves must be shaded, and the crop of tubers must be so much less in consequence.

But if, in addition to this over-manuring, the rows are too near each other, the evil is much greater, the Potatoes now run to tops with a vengeance; the stems are drawn up, they are taller and weaker than if grown farther apart; the sap, as was observed by Mr. Knight, will have farther to travel, and more time will be required for its ascent and descent; and even if the stems should continue upright to the end—and it is hardly likely they could—there would even then be a less breadth of efficient foliage than if the rows had been at proper distances apart. In the latter case, almost every leaf might have been able to perform its functions, while in the former case the lower leaves would be shaded and useless. The plants would have presented a comparatively level surface—the uppermost leaves only would have been efficient.

Look at our woods. A wood where thinning has been wisely attended to, will yield a much greater weight of timber in a given time, than another wood where the trees have been left to themselves after planting. In a few years the branches meet, then intermingle, and the trees become engaged in a life or death struggle, fighting as it were for the precious light.

The cause of the difference in the weight of timber produced is obvious, for there must be a much greater breadth of foliage exposed to light by an acre of more or less cone-shaped trees, standing at proper distances apart, than by an acre of trees which are crowded.

There is another case which I may as well mention now, by which it is possible there may be a vigorous growth of stems, without a corresponding crop of tubers; and that is, where in a poor soil manure has been placed, as is the common practice, in the rows only. Some may be inclined to doubt this, but it was the opinion of the late Mr. Knight. In such a case he observed, the young plants grow very freely at first, because their first emitted roots find abundant nutriment, and these roots consequently extend rapidly; but they extend into the unmanured soil, and if that be not rich, it cannot afford food. Abundant machinery will consequently exist with a scarcity of raw material; and the produce of tubers will naturally be found defective, comparatively with the growth of the plants.

If Liebig's theory of the summer nutrition of vegetables was true, this should be the best and most economical mode of applying manure, because we should then have the greatest amount of foliage at the least expense of manure. But as has hitherto been the faith of this country, plants depend upon the soil as well as upon the air for their food during the summer, as well as at any other period of their growth. We should, therefore, be careful to provide for their summer wants.

If "R." then, has any faith in the above remarks, he will withhold his liquid manure from his Potato crops next year, and so apply the other manure that his plants may live frugally, and not expend that in the production of superfluous stems and leaves which should have been reserved for the more important production of tubers. He will be careful also that his plants have sufficient breathing room, and that the rows of his late varieties be at least two feet apart. The object to be aimed at is to have the whole of the ground covered with foliage during summer, without the leaves of one plant interfering with those of another; this is a point of great importance in the culture of all plants producing grain, fruit, timber, or roots, and I am afraid is not yet sufficiently understood by the majority of those whom it more particularly concerns.—*J. Townley.*

ON THE ACTION OF GYPSUM, WITH REMARKS ON MISSTATEMENTS OF THE WRITER'S VIEWS.—By J. S. Henslow.

I am not intending in this communication to enter into any discussion respecting the fixation of ammonia by gypsum. I propose doing this on some future occasion, whenever I shall have been favoured with the returns I am still expecting to receive of my Schedule A. Can I hasten those returns a little, by requesting the several experimenters to forward them as soon as they conveniently can, or else to inform me of the reasons why they have not been able to fill them up? My present object is a word of advice to practical men, on a subject which is of quite as much consequence to them as the determination of a disputed point in agricultural chemistry. I would seek to impress upon them the propriety of extreme caution in attending to the advertisements of merchants who are recommending the novel manures which are now being applied to various agricultural purposes. I am not alluding to the adulterations of these manures, but to the applications of them. The public has already received due caution respecting the iniquitous extent to which such adulterations are carried on; as in the example noticed in page 259 of the *Gardeners' Chronicle* for 1844, where a substance was proved by analysis to have been adulterated to the amount of 97 per cent.; so that a farmer might be obliged to pay at the rate of 66*l.* per acre, instead of 40*s.* to produce a proposed effect. I pass by the dishonest dealer, and wish to speak of the advertisements of dealers whom I shall presume to be perfectly honest, but mistaken in the advice they give to the farmer. I find my name has been set forth as a guarantee for the efficacy of gypsum in its application to agricultural purposes, and therefore I have a right to caution the public against supposing that I have directly sanctioned what I certainly have not advised to the unqualified extent which might be supposed from the terms of an advertisement lately sent to me. I have not the slightest intention of impugning the motives of the advertiser, of whose firm I know nothing, any more than I know of any other firm dealing in this description of merchandise. But I must declare that he has gone far beyond anything I have ever stated in recommendation of gypsum as a fixer of ammonia. He may be quite right in his recommendation of gypsum for such purposes, and I shall be much surprised if it does not prove to be efficacious under peculiar circumstances; but his declaration of my views is much too unqualified when he says—"Sir John Herschel, Liebig, Professors Henslow and Johnstone, strongly advocate the addition of gypsum to liquid manure-tanks, and dunghills, for the purpose of fixing the ammonia." Surely any one who has seen and thought about what I have said in my "Letters to the Farmers of Suffolk," must have understood that I have hitherto been inviting practical men to make trial of the advice which chemists have given them concerning gypsum as a fixer of ammonia. In my Address to the Hadleigh Farmers' Club, which precedes those letters, I have stated at p. 15, that the subject had not yet been fully elucidated; and again at page 20, I have said "I will even venture to recommend (till good reason shall be shown against such a practice), that a little powdered gypsum be scattered from time to time over the materials (of the dunghill) as they accumulate; it can do no harm, and I believe may do much good. Let a sufficient quantity of water be sprinkled over it to wet the gypsum thoroughly." This exposition of the applicability of the views of chemists concerning the use of gypsum, is very far short of proving me to be a "strong advocate" for the use of it under all the circumstances named; and the letters which follow greatly qualify even the opinion given above; because I afterwards found that some chemists of reputation were doubtful of the gypsum proving effectual in dunghills. I wrote those letters with a view to provoke practical men to decide the question for themselves. I am not yet in a position to state the result of their co-operation for this purpose. I felt surprised also at finding the name of Sir John Herschel quoted as a "strong advocate" for the use of gypsum, and therefore wrote to the advertiser to point out to me any passage in Sir John's writings which might relate to the subject. He has obligingly referred me to the 'Farmer's Magazine" for 1843, p. 143, where he states

there is some allusion made to Sir John Herschel's discourse on "Natural Philosophy." As I have not any opportunity of consulting the "Farmers' Magazine," I wrote to Sir John Herschel himself, and have this morning received the following reply:—"I never gave any opinion of the kind you mention, about guano, gypsum, or dunghills. I have read in the *Gardeners' Chronicle* that gypsum does fix ammonia; but I never tried the experiment, and have even some small doubt of the fact that carbonate of ammonia, in a liquid or vapourous state, will decompose solid crystallised sulphate of lime, though I do not deny that it may." Those persons who like myself are anxious to see practical men concentrating their efforts for ascertaining the modes of applying science to practice, in that only way which can be very certain of saving them much time, trouble, and expense, have quite enough of prejudice, ignorance, and apathy to contend against without having their opinions misstated, and their proposals perverted in a way which may induce practical men to fancy that science is in error whenever the results promised them by manure merchants fail upon their making trials of their merchandise. I lately noticed a communication from one of your anonymous correspondents, complaining of his having been misled in some way or other by "march-of-intellect men." I see he has since asserted that his remark was not intended as a sneer, but as a caution. I readily offer him the right hand of fellowship in maintaining that sentiment. I am a humble admirer of all "march-of-intellect men," though I belong myself to no other than the awkward squad of their army. Whilst it has been my endeavour to point out to agriculturists the advantages which must follow from their listening to the suggestions of our scientific leaders, I have constantly insisted, in language as plain as I can command words to express myself, on the absolute necessity of caution, on the exceeding absurdity of costly experiments, and on the great facilities they have in their power for working a correct, secure, and rapid method of arriving at legitimate conclusions.

Possessing a hearty desire to see the most important interest in the kingdom improving and flourishing, I feel very unwilling that any little exertions I may have considered myself sufficiently qualified to make in favour of that interest, nullified by misapprehensions and misstatements of my own recommendations. This desire inclines me further to allude to a statement which possibly some of your agricultural readers may have lately noticed either in the *Times* or its adjunct the *St. James's Chronicle*. I may possibly be influenced by other motives as well as the one which I have assigned, but I shall crave your indulgence in introducing the subject here, because I think the effort which has been made to characterise me as a fool, may have some influence in preventing practical men from attending to any future suggestions I may offer them for the application of science to agriculture. A reporter of the *Times* has chosen to say that I have recommended "fireworks as a mode of suppressing incendiarism in Suffolk!" Certainly if I had done anything so foolish, I should not deserve the slightest attention from practical men to any suggestions I may in future make to them. The facts are as follow:—There is in London a Society, called the Labourers' Friend Society, which has effected much good in some counties, by the introduction of allotments, and by various suggestions for benefiting the labourer. A few months ago it was publicly announced in our local papers that it was in contemplation to establish a similar Society in the west division of Suffolk. By way of inviting attention to a variety of topics connected with methods already adopted in different places for assisting the poor, I determined to write a letter weekly in the papers until the meeting preliminary to the formation of the Society should take place. The subjects treated in these letters have been successively—Village Ploughing-matches; Loan Libraries; Coal Clubs; Allotments; Medical Clubs; Official Charities; Benefit Clubs; Recreations for the people. In alluding to the last of these subjects I noticed a plan which has been pursued in my own village for the last seven years, of having a little annual exhibition, for the amusement of the parish, chiefly with fireworks. In recommending something of this sort as a means of restoring periodic returns of amusement to the people, of which there are now very few or none of a creditable character in this part of Suffolk, I proceeded to explain the great facility with which any country family, taking delight in offering recreation and amusement to their neighbours, might prepare such an exhibition in a way that was comparatively unexpensive, and little troublesome. Why this reporter has chosen to say my object was to propose fireworks as an antidote to incendiarism, I shall leave to the suggestions of his own conscience. Any one is welcome to consider me a fool for recommending fireworks or any other works, as a means of amusing our country folks. Such kind of folly is not incompatible with a power of giving advice on the subject of the application of science to practice; but the supposing it possible that I could give such advice as this reporter has strangely ascribed to me, would necessarily be accompanied with a degree of incredulity concerning my capability of giving good advice on any subject whatever, beyond that of squibs and crackers. As for incendiarism in Suffolk, I have publicly stated my opinion on that subject, in a pamphlet I published last August. I believe the crime originated more immediately from the want of employment among a large number of the poor; and I have not yet heard anything to shake that conviction. Why the people are less employed now than they were three or four years ago, is a question which I am not called upon to discuss; but whether they may happen to be sufficiently employed or not, those particular methods to which I have referred are equally adapted to assisting, comforting, or amusing them. I have never proposed either one or all of them together, as substitutes for a want of sufficient employment, or as panaceas against any of the evil consequences likely to result from a want of sufficient employment.—*J. S. Henslow, Hitcham.*

Home Correspondence.

Dressing Wheat.—I think, perhaps, the inclosed receipt for dressing Wheat will be acceptable to many of your readers at the present season; its simplicity must recommend it, and I assure you it is a certain remedy against smut:—Shoot a sack of Wheat upon a good brick floor, and place upon it a pailful of boiling water; put a double handful of new lime into the water, and let it remain a few seconds till the water is well impregnated, and then quench it with a quart of urine, or salt water that will carry a new laid egg; pour it over the Wheat, and let two persons stir it well, taking care that every grain is made wet; it will be ready to drill in two hours. The water should boil and the lime be new in lumps.—*A Norfolk Farmer, Fordham, Downham Market.*

Way to Store Cabbages.—Your correspondent "Querist" wants to know the best way of preserving Cabbages in winter. I have little to communicate on the subject; but to what I have, if of any use to him, he is welcome. I have been informed that Drumhead Cabbages are preserved in some parts of Oxfordshire in a way somewhat similar to that of storing Potatoes out of doors. The Cabbages are taken up on a dry day and the stem and loose leaves taken off; they are then put in heaps in a manner like cast-iron bullets in an arsenal, broad at the bottom and narrow at the top; afterwards they are covered with earth. Some years ago I tried to preserve a few barrowfuls of early York Cabbages in winter; I stored them in an outhouse in two lots; one lot was covered with sand, and the other with sawdust; it was done in October. I examined them about the beginning of January, and found that the rats had nearly destroyed them all; the few that remained had the outside leaves rotten, but the heart was good.—*Peter Mackenzie.*——[To this we add the following from a correspondent]—Dig a pit in a dry place, say ten feet long and five or six deep; put in a little dry straw at the bottom; then place your Cabbages (first depriving them of any decayed leaves) on it; put a little dry earth over them, another row of the Cabbages, more earth, and so on till the pit is full; then cover them with dry reeds or Ferns, and put the earth that has been dug out of the pit over them in the shape of a roof, beating it down well, so as to exclude the air and heat: in this way I have found Cabbages to last me till new ones came in, and much longer.—*J. B. Warren, Crookston.*——In addition to this, *R. G.* says:—About two years ago I was staying with a friend, whose gardener was then about storing his Cabbages, of the large drum-head kind. He cut them off, turned them down, and let them drain for a day or two; then marked out a spot, on which he placed a few Pea-sticks. On these he placed the Cabbages, with their heads down; then a few more sticks, or Pea-haulm, for the next tier, and so on, just as you may have seen cannon-balls piled. Outside he put a little straw or slight thatch, just sufficient to throw off the wet, and to allow a good circulation of air. In this way, he assured me, he would keep them till March or April for the family use.

Hedgerows, &c.—Having read with much interest in your Paper, "Notes of a Journey through Southern and Western England," by a Strathern Farmer, I beg to submit a few remarks. Every agriculturist of the present day cannot but deplore the very low ebb of farming in those parts of England which your correspondent has alluded to. Look at Sussex, where a considerable portion of the soil is good, and under a favourable climate, and contrast it with the high lands of Scotland, where the bounties of nature are scarce. But there, in respect to the system of cultivation, they are far in advance of what they are in the south of England, where the country is cumbered with slovenly hedgerows, large brakes and covers, and useless trees, with which the land is surrounded in small patches; their system of ploughing is generally with three horses in a line, with a plough as rude as in the days of Pharaoh, walking in the furrows, while it is well known that if two are yoked properly abreast they will have more power than three in a direct line, besides the injury they do to the subsoil by constantly treading it down. From my early experience in farming under disadvantageous circumstances, so far as regards soil and climate, I do not hesitate to say that if England was cultivated the same as Scotland, the land is capable of yielding double the increase. To obtain this desirable end a new system must be adopted—one that would not only give employment to the labouring class, but provide an abundant supply of food for an increasing population; which certainly must be preferable to sending the surplus population to a distant land, or having a dependence on a foreign country for a supply of food, whilst our own land is uncultivated.—*Alex. Russell, TurnhamGreen.*—I agree with Mr. Grant of Exeter, and a correspondent in your *Chronicle*, regarding the waste of lands by hedgerows; the impoverishing the ground by trees and thorns planted in them; their being a harbour for weeds (with slovenly and bad farmers); the cost of keeping them in repair; and, as in some of the provinces, their being allowed to run so high round small fields, that, owing to the scarcity of light and air, by them a vast deal of the crop is robbed of its light, and natural food. Yet, on the other hand, in cold and bleak districts the warm hedge has its advantages; the horse, cow, and sheep are sensible of the protection it affords them from storm as well as sunshine. Moreover, I am old enough to have a lively remembrance of Napoleon's intended invasion of this country, and how many writers then looked to the hedges of England as formidable bulwarks against an enemy. But, apart from hedges in a warlike point of view, how *triste* the land would picture to the eye of such men as a Goldsmith or a Wilson with immeasurable plains without a break! What would become of the merry singing warblers from hedgerows? Their destruction, perhaps, many a farmer thinks would be reason enough to have the hedges down. But whether are birds friends or enemies to the farmer?—there is wide opinion concerning the general harm or good they do.—*Lt.*

Failure of Potatoes.—As the cause of the failure of the sets, when planted, is still involved in much obscurity, I mention the following circumstance:—One of my neighbours planted a ridge this year, with the kind called here Prolifics; the sets were all cut at the same time, and from the same sample; part was planted in the afternoon of one day, and the remainder next morning. The first all grew, and of those planted the next day, nearly all failed. The state of the land in each case was perfectly similar; the weather had been dry, and no rain had fallen in the interval. The circumstance is curious, and to me perfectly inexplicable. Can any of your correspondents account for it?—*Lusor.*

New and Old Land.—In answer to "Paddy," in your last Number, I see no conflict between the prevailing theory of the day and the practice stated in an extract from Cobbett's "English Gardener," because Peas in a garden are invariably set at considerable intervals; and if care be taken, they may be planted on the same border annually on a fallow of three years' standing. Had the Peas been sown broadcast for 15 years, Cobbett would have had to tell a very different tale.—*W. C.*

Flax-seed—Having perused with interest the Articles by Mr. Sproule upon the cultivation of Flax, and also the details given as to the uses of Flax-seed as a food for cattle, as practised by Mr. Warnes, I venture to ask that gentleman to favour us with a little further information as to his mode of preparing Flax-seed before making it into jelly. Mr. Sproule seems to speak as if a common corn-crushing machine was sufficient for grinding it before it is boiled into jelly; now, I have myself tried this method, and made good thick jelly, but could not satisfy myself that its effect in fattening cattle was at all equal to that of the common oil-cake. The failure in my own case may have arisen from the seed having been insufficiently crushed, and a portion of it passing through the animals without being digested. Is it possible to grind Flax-seed in a common grist-mill, so as to make linseed meal; or would the oil be thereby expressed? The supply of good nutritious winter food at the cheapest price, is at the present moment a subject of such paramount interest to most farmers, that I make no apology for intruding it upon your columns.—*A Gloucestershire Subscriber.*

Fire-clay as a Manure.—While on a visit at the residence of Thomas Sprot Esq., Garnkirk, near Glasgow, along with two or three other gentlemen whose names will be furnished, if desired, I had the gratification of testing the result of an experiment made between the fertilising properties of stable-dung and fire-clay, which I have no doubt will prove of interest to your horticultural as well as agricultural readers. In the month of April last, Mr. Sprot selected four Potatoes, of the kind called in that quarter Red Droppers, of medium and all of an equal size, which he planted whole. Two of these he planted with a large spadeful of well rotted hotbed stable-dung well incorporated with the soil. The two others he planted alongside of the above, and about 18 inches apart from them, incorporating with the soil about an English pint of the Garnkirk fire-clay, ground to a powder. The chemical constituents of this clay, which is dug from a depth of about 20 fathoms, as tested by Professor Thomson of Glasgow, are given below. The whole four Potatoes came away, and those grown with the dung at first took the lead; but in a short time those grown in the fire-clay gained upon and got in advance of the others, exhibiting broader and more luxuriant foliage. On 30th September, when the produce was taken up, the stalks of the dunged Potatoes were quite dry and decayed, while those in the fire-clay were green and but slightly faded in the leaf, and might thus have grown for some little time longer. These are the results:—

Those in hotbed dung:—

No. I.	25 Potatoes	2 lbs.	weight.
No. II.	21 „	4	„

Those in fire-clay—

No. I.	28 „	6¼	„
No. II.	23 „	5¾	„

Thus the fire-clay produced in both shaws not only about double the weight produced by the dung, but the Potatoes were larger and finer in appearance. Four of the fire-clay ones were boiled and found to be of excellent quality, mealy, and finely flavoured.

Transmutation of Species—Curiosity in Corn.—What we may call a natural curiosity was brought to our office by Thomas J. Biggs, Esq., of Garryhandkerdmore on Saturday. It was an ear of Wheat, with a

grain of Oats regularly formed and full, growing out of each side. The ear was picked up at Shippool, the residence of Captain Herrick.—*Cork Can.* As a proof of the correctness of Lord Bristol's experiment on Barley, mentioned in one of your late Papers, I send you the above paragraph, taken from a Cork paper, which most probably you may not have seen.—*E. F. L.*

FARMERS' CLUBS.

Inverness.—The following are extracts from a communication by R. Grant, Esq., of Kincorth, on the interesting subject of Reclaiming Sand-hillocks and Beaches by Plantations of Scotch Fir and Larch. We are indebted for them to the *Inverness Agriculturist*, in the columns of which the letter was placed by Mr. Anderson, Secretary to the local Farmers' Club of that district, to whom it was addressed:—"Were my accounts to be exhibited, I do not believe they would entitle me to the praise of an economical planter; but my object is rather to describe what I consider I may now deem a successful attempt to clothe pure sand hills with thriving plantations of Scotch and Larch Firs. The ground planted is situated in the outskirts of the well-known tract of the Sand Hills of Coubin, which are so conspicuous along the sea-coast, to the northward of Forres. My residence being in the immediate vicinity of that dreary waste, I long felt an anxious but hopeless desire to adopt any probable means by which the barren appearance of the neighbourhood might be improved; but for years I could not bring my mind to cherish a hope, notwithstanding the repeated recommendations of friends to plant, that trees would grow on so sterile a soil; and it was not until 1836 that I at length resolved to make the experiment. The whole plantation covers an extent of about 70 acres, in the form of a belt, extending about a mile in length, and varying from 100 to 400 yards in breadth. Some portions of the ground consist of a flat sandy moor, intermixed with small quantities of Moss, which, when planted, was covered with some coarse Grass and stinted Heather. In other places the soil is of a black gravelly nature. And, with respect to these two divisions of the plantation, there is nothing of peculiar interest to detail, or remarkable in the growth of the plants; and I shall only allude to them as exhibiting the comparative growth of plants under ordinary circumstances, with that of the trees planted in the sand hills, which extend over the remainder of the plantation. Of these sand hills, or more properly hillocks, I may state that they are of that description the appearance of which must be familiar to every one who is acquainted with the sandy coasts of the country: they vary in shape in every possible way, and in height from 10 to 30 or 40 feet. With respect to the herbage upon them at the time when they were planted, they may be divided into three classes: 1st, Those most recently formed from sand-drift, on which Bent alone, and that but partially, grew—quite clean and open about the roots, as Corn in a well-cleaned fallow field; 2d, Those where the Bent, having been protected for years, had rotted, and the ground being afterwards pastured by sheep and cattle, a thick sward of Grass had grown up in its stead; 3d, Those which were in a still more advanced state from their original formation—the grassy sward or crust upon them being supplanted with Whins and Broom. The planting was commenced in the spring of 1837, and was continued annually, in portions of from 15 to 20 acres, until the whole was finished. The plants were of the common description of Larch and Scotch Fir—the latter grown from seed procured from the forests of Strathspey. They were raised by Mr. Grigor, nurseryman at Forres, in his nursery there; and before being planted they were not removed from their native nursery ground to any intermediate description of soil, to prepare them for transplantation to the sand-hills. The plants first used were very small, being one-year-old transplanted seedlings; and these throve remarkably well in the moorish ground, and also in the Bent hills, where the moisture easily got access to the roots of the plants. In the grassy parts, however, most of the small plants withered, from want of sufficient moisture, or from being choked by the Grass; and I afterwards found that larger-sized plants succeeded better in such ground, which I conceive arose from their having more sap within themselves, which enabled them to resist the drought longer, and until vegetation commence. With respect, indeed, to these arid grassy parts of the plantation, I cannot report that I have been as yet, notwithstanding repeated planting of the ground, very successful in establishing a sufficient quantity of healthy plants in the soil; and I must confess the waste of plants and labour in these parts has been very great. In the moor ground and soft open sand, the planting was executed by women, with small iron dibbles, which mode I found perfectly successful. In the second planting in the grassy places, I employed men to plant with spades, who pared the surface before putting in the plant; and this plan I have found attended with more success, although considerably more expensive. I have already stated that Whins and Broom covered certain portions of the ground; these before planting were cut, and allowed to remain on the ground, and have sheltered the young plants, which have generally thriven pretty well in such places. Before concluding this short statement, I may mention that some parts of the ground were planted in November and December, and others in the spring months. I have little hesitation in saying, from my experience, that winter planting should always be adopted in preference in such dry sandy ground, as the winter sap invigorates the plant, and enables it to outlive the summer drought. I must repeat that the expenses of the work exceeded the ordinary outlay upon such improvements—partly occasioned by the great destruction of plants during the first two years by rabbits, which infested the ground in great numbers, and which I had not taken the precaution to have destroyed; and an extra expense was also incurred by the cleaning of those parts of the ground which were covered with Whins. But this is the first experiment, so far as I know, which has hitherto been made in Scotland of planting sand-hills, and my success has been such as I think warrants me in holding out encouragement to proprietors who may possess similar ground along the flat, bleak, wild, and profitless coasts of our country, and who may be anxious to change their barren aspect. The most advanced part of my plantation is now seven years old, and I gladly invite any who may feel an interest in the subject to visit the place, and witness the healthy and vigorous condition of the plants at their present age. It is impossible, indeed, to predict what height or size trees may ultimately attain in such soil. I am far from expecting that timber of any great size will ever be procured, although I am sanguine that trees which may be useful for many country purposes will grow on it; but I think I may safely assert that, in the great object I had in view, I have every prospect in due time of perfectly succeeding, viz., in rendering what was an unsightly desert in some measure ornamental."

Stow-on-the-Wold.—The meeting of this Society was held on Friday week. Mr. Newberry's dibbling-machine was the subject of not a little conversation during the day. It was related that Mr. Harris, of Upper Swell, had threshed out an acre of drilled Wheat, and an acre dibbled by Newberry's machine; on the drilled acre was sown six pecks of seed, and on the dibbled five pecks; the drilled produced 26 bushels, and the dibbled 33 bushels and a half; the dibbled Wheat was heavier by a pound a bushel than the drilled—making altogether a produce of upwards of 30 per cent. available for the market, in favour of the dibbling-machine.

Reviews.

The Report on the Agriculture of Norfolk, to which the Prize was awarded by the Royal Agricultural Society of England. By Richard Noverre Bacon. London: Ridgway, Piccadilly.

THE diffusion among farmers generally of what is already known and practised by the few of them in our best cultivated districts, is in all probability the most efficient method of improving British Agriculture. More good will probably be done thus, and with greater economy too, than by increasing the number or encouraging the industry of the numerous labourers now working on the junction lines of agriculture with the sciences by which it is surrounded. Do not let us be thought to undervalue the labours of the chemist or geologist; the farmer has of late become deeply indebted to scientific men for important suggestions and explanations of practice. There is still, no doubt, room for great improvements in our best systems of farming—improvements which have been, and probably will continue to be indicated by scientific men; but there is such a great difference between the practice of those who farm well, and that of the many below them on the scale of excellence, that great national good would undoubtedly arise from an improvement in the management of the latter class, though that of the former should for a long time remain stationary.

If we could find as superintendents, men uniting a perfect knowledge of the system to be promulgated, with a capability of duly estimating the influence of the peculiarities, as regards soil, climate, &c., of the districts in which they would be stationed, then the establishment of example farms would undoubtedly be the best method of effecting this improvement. But few, if any, such farms are now in existence, and in their absence we must therefore look to the assistance of the press, and hope for success in the efforts now making to set before the agricultural world the modes and results of the practice of good farming.

The late Board of Agriculture appear to have been fully impressed with the importance of this kind of publication, and they accordingly addressed themselves to the task of collecting agricultural reports of all the counties in Great Britain; and a series of volumes was the result, which contain a vast mass of useful information. The English Agricultural Society, after the lapse of 30 or 40 years, are adopting a similar plan, and several county reports have lately been published in their journal. The volume before us is the report of Norfolk, to which their prize was awarded. It was too voluminous a production to appear in their Journal; but, comparing it with those which have already appeared in that periodical, as it enters into greater detail than any of them, and as it describes a district which has been long celebrated for its agriculture, we hope it will not on that account be the less extensively read and known.

We shall take another opportunity of directing the attention of our readers to it, more closely and at greater length, simply stating at present that its contents are very interesting and instructive; and that the authorities given for its accuracy are both numerous and unexceptionable.

The Police and Constabulary List. Parker, Furnival, and Parker, Military Library, Whitehall, London.

THIS is one of a quarterly periodical (for the quarter ending September, 1844), intended to present in tabular forms the arrangement and nature of the police force employed in the metropolis, the counties, and provincial towns of Great Britain, together with details of the nature and amount of crime in the several districts in which they are stationed. The aggregate of all these subordinate statements for the quarter is represented in a well-arranged Table at the commencement of the volume; the number and character of the various instances of offence, within the period, being given for each of the several main districts, such as agricultural, manufacturing, and maritime, into which the author has divided the country. Besides the technical and professional usefulness of such a publication, so well-arranged a statement of the condition of a country in one of its most important aspects, must be of great value in the eyes of all those interested in the statistics of crime.

Miscellaneous.

Cure for the Distemper in Cattle.—I cannot resist giving a receipt for the treatment of beasts that may take the prevalent distemper. It showed itself last winter in one of my yard stock, by its discharging abundant saliva from the mouth, with sore and inflamed tongue and gums, very dull, no appetite, confined bowels, and very hot horns. I desired the bailiff to give him one half-pint of the spirit of turpentine, with one pint linseed oil, repeating the oil in twenty-four hours, and again repeating it according to the state of the evacuations. At the end of twenty-four hours more, the bowels not having been well moved, I repeated both turpentine and oil. In two days the beast showed symptoms of amendment, and in three or four took to his food again, and did perfectly well. All the yard beasts and two of the fattening beasts have had it (five others I had sent to London before the disease appeared), and all have been treated in the same manner with perfect success. Half-a-pint of turpentine is the smallest, and one pint the largest dose during three or four days. Little food beside Oatmeal gruel was given.—*Quarterly Journal of Agriculture.* [The remedy above prescribed has been found effectual in this neighbourhood in several cases, even where the disease had attained a considerable height. It was tried with success by a farmer near Donnemana, and many of his neighbours whose cattle had taken the distemper.—*Londonderry Sentinel.*]

Report of the Thorough-Draining executed on the Estate of Edward Lucas, Esq., Castle Shane, Monaghan, by Fitzherbert Filgate, Esq.—The small drains are dug 32 inches deep, 5 inches wide at bottom, 7 at top of stones, and 16 at top of drain; 14 inches in depth of stones, which are covered with a Grass sod, about an inch in thickness, the Grassy side downwards; the remaining 17 inches filled with the earth cast out in cutting the drains. The width at bottom, 5 inches, is greater than is generally to be recommended; but I was prevented cutting them as narrow as I could wish, from the slaty nature of the stones of the neighbourhood, which does not admit of their being broken small; as, if reduced below a certain size, they fly into a hundred pieces. The stones being large, the drains were made wider on that account; and, although I would never recommend the practice where stones which would break cubically could be procured, one advantage is derived, namely, the possibility of cutting your drains with the spade in common use in the North of Ireland. In that case the only implement required exclusively for draining purposes, is the scoop or shovel for cleaning out the bottom of the drain. After the scoop is used, I have the bottom of the drain swept down with a broom; and the stones having been first carefully riddled, are immediately put into the drain: thus, as far as possible, guarding against mud and dirt, either lying in the bottom of the drain, or being introduced into it along with the stones. I consider that the sooner the drain is filled after being opened the better, particularly in frosty weather succeeded by rain, such as we frequently have in the early part of winter. If this be not attended to, much waste of labour and stones arises, and each cleaning out the drain, of course, enlarges it. Should delay in filling be unavoidable, it is prudent to stop up the mouth of the drain with straw, when communicating with other drains, and so prevent a run of sand or sediment into them. I never run the parallel drains into an open main drain; because, the mouths of these drains are sure to be stopped by grass growing at them, by frogs or rats running up them, by cattle tramping, and by the stones slipping, if the drains are on a steep inclination. The expense of main drains is, no doubt, considerable; but Mr. Smith, of Deanston, having mentioned that main drains, filled with broken stones, were equally effectual with those flagged or arched, I was induced to try the experiment, and have every reason to be perfectly satisfied with the result. The difference in expense is very considerable, amounting in my case to 2*d.* per perch for cutting and breaking stones; and the difference in the quantity of stones used is immense; $6\frac{1}{4}$ cwt. of broken stones suffice, when $14\frac{3}{8}$ cwt. is required for flagging. The small drains are all made 18 feet apart. The main drains were, for the most part, flagged—made 38 inches deep, that is, 6 inches deeper than the small drains; the open or swallow being 6 inches wide and 8 deep. Some of the later main drains were filled with broken stones, about 4 inches in diameter; these drains were also 38 inches deep, 9 inches wide at bottom, with 21 inches deep of stones. None of the main drains are of less dimensions than those given above, and some are considerably greater. It is, of course, understood that the depth to which it may be necessary to sink a main drain, for the purpose of procuring a proper fall, will depend upon the nature of the ground; the dimensions given are those supposed to be necessary in the most favourable cases. Iron gratings, like gridirons, are placed at the mouths of the main drains, to prevent the ingress of rats or frogs; and such a precaution is most necessary, as myriads of the latter especially will ascend and choke the drains, as may be easily ascertained by opening one

some time made. I may add that the stones are laid alongside the intended drain before the cutting has been commenced. Early in 1842 I commenced upon the field containing 15A. 1R. 5P. It is a field of strong clay, generally 10 inches deep, upon an almost impervious subsoil of white till mixed with small stones, so hard, that the pick was required in every inch. The main drain crossing a part of the field, runs in a hollow, and was necessary from the nature of the ground. The prices paid for executing the different works in this field were higher considerably than those since paid; as it was only the second field that had been attempted here, the people in the neighbourhood were unaccustomed to the work, and could not calculate the value of their labour by the perch; nor from want of experience in the former works, could they earn as much, perhaps, as they since have done at lower rates. The field lies on the side of a very steep hill, which made the drawing of stones difficult. In this case two contracts were made: one for cutting the drains, breaking the stones, sodding and filling the drains, at 3½d. per perch of small, and 7½d. for main drains; another for quarrying in an adjoining field on the demesne, drawing and laying down stones alongside of drains, at 4½d. per perch of small, and 18¾d. per perch of main drains. The account of this field therefore stands thus:—

No. of acres in field.	No. of perches of small drains	Price per perch.	No. of perches of main drains.	Price per perch.	Total cost of field.	Cost per acre.
A. R. P.		s. d.		s. d.	£. s. d.	£. s. d.
15 1 5	2317	0 8½	1972	1 4½	92 16 6	6 1 6

This field was broken up after being drained, and sown with Oats, which turned out a very heavy crop, averaging 150 stones per acre. It was then deep ploughed, and is this year (1843) part in Potatoes, part in Turnips; the former are an excellent crop, producing 14 tons 7½ cwt. per acres; the latter middling, having run very much to top, which I attribute partly to the season, and in a great measure to the sheltered situation of the field, being nearly surrounded by planting.—*From the Irish Agricultural Society's Report.*—[*To be continued.*]

Lucerne.—Mr. W. Pepper, of Sutton Coldfield, has raised a crop of it for several years. It may be harrowed in with Barley on land that has carried Turnips. It should be covered in October or November with light stable manure; harrowed in the spring to get out the weeds; and deeply harrowed, almost like a fallow, in the autumn. The broadcast he considers better than the drilled. In some seasons he has got twelve tons to the acre: he has seen it run to the height of five feet five inches; its ordinary height is four feet. An acre will keep three strong cart-horses for six months, from 1st of May to October.—*Royal Agricultural Journal*, vol. iii. Parts 2 and 3.

Thick and Thin Sowing.—You think thin Wheat is not more liable to mildew than thick. Now all I have ever seen or experienced proves the contrary; namely, the thin late Wheat is sure to take it if any does, while the thick is frequently not injured at all. I have occupied between 500 and 600 acres of land for upwards of 30 years, and never suffered through having Wheat too thick by sowing but once, and that was last year; but many times through being too thin. Owing to some of my Wheat being so very thick and down last year, and hearing so much of throwing seed away last Wheat seed-time, I thought I would try the thin system on a six-acre piece. I dibbled two acres in the middle at the rate of four pecks per acre, the two acres at each end with eight pecks per acre, the land all being done just the same; but the result was, I believe I had double the quantity of Wheat where I sowed eight pecks, to what I had where I only sowed four; and where I drilled 12 pecks per acre on other land, I had a much better crop than either of the others. Mine is poor land, and I believe thin sowing will never do for such sort of land; at any rate, I am quite satisfied, and will not again try four pecks per acre if I can help. I confess this is not a good year for thin-sown corn.—*Correspondent of Bell's Weekly Messenger.*

Stifle-burning.—Residing in a district in which stifle-burning is a good deal practised, and having been in the habit of doing a little on my own farm, I will simply state what I consider to be its advantages and its disadvantages. On heavy and tenacious soils its effects are decidedly good, in pulverising the land, making it work more kindly for the succeeding crops. Stifle-burning is usually a preparation for a Turnip crop; in moist seasons they are very good on this plan of management. On thin stone brash land, which is already too light, it must be injurious, as it certainly makes all soils porous; and as this kind is improved by being made firmer, I think it would be better not to burn the earth at all, but only the vegetable matter which works to the surface. This can only be proceeded with in very dry weather; therefore it cannot always be depended on regularly for procuring a crop of Turnips, which the summer of 1843 fully proved: other manures were then resorted to as a substitute. The expense attending it is also a disadvantage; on an average not less than one ton of straw per acre is used, which, added to 10s. per acre for manual labour, makes it more expensive than a moderate dressing of bones, which I consider to be superior. The old system of paring and burning is undoubtedly excellent, as an active manure is produced by burning the turf, couch, &c., without weakening the soil. Although it has been much spoken against, and altogether prohibited by some landed proprietors, farmers on light soils would feel a great loss if denied this privilege of paring and burning. —*A Farmer near Bradford.—Bell's Weekly Messenger.*

Notices to Correspondents.

Arrangement of Horses in Teams.—*W. C.*—The highest horse should be foremost, and the least next the implement, the others being ranged forward according to their height. It is much more economical to adopt a plan in which, every horse pulling directly on the implement, their arrangement with regard to one another becomes of no consequence. We shall very shortly consider the best way to harvest roots. Your arrangement for [illegible]

Books.—*A. Z.*—We know of no work expressly to afford instruction in the art of fattening prize beasts. See Hillyard's "Practical Farmer and Grazier."

Death of Ewe and Lamb.—*A. B. C.*—Like the Chaldeans of [illegible] Daniel, we are unable to expound the matter. If it had been mentioned what leaves the ewe and lamb ate, we might have [illegible] A small portion of the leaves of the Yew tree, particularly if in a withered state, would produce the effect stated.—*W. C. S.*

Food for Young Pigs.—*Cockney.*—Steamed Potatoes and Barley meal, with water, or whey, or skim-milk.

Gardeners' Chronicle.—*B., Scarborough*, can have the volume for 1841 of the *Gardeners' Chronicle*; order it through your bookseller; as, being bound, it cannot pass by the post.

Harvesting Roots.—*W. C.* and *A Young Beginner.*—Please wait till next week and we shall give full information then.

Index.—*A Constant Subscriber, Barnstaple*, will have, at the end of the year, a complete Index. The weekly ones surely very much simplify the task of finding any article.

Lime and Manure.—*H. C. S.*—If you manured this spring, you may, with probably greater advantage (comparing it with the expense), apply 100 bushels of lime *now*, for next year's crop, than apply manure which you say would cost 8*l.* per acre. If it was last year that you manured, you had better apply another coating of manure next spring, and in that case reserve your liming till the year after, or at any rate till the autumn. Generally speaking it is considered better policy to apply lime before a Corn than before a green crop.

Poor-rate Appeal.—*Maitland.*—The Court of Quarter Sessions or the Justices in Special Sessions, before whom an appeal against a poor-rate is determined, have the power to award, and generally do award costs to be paid by the *unsuccessful* party.—*W.*

Potatoes.—*J. B.*—R. recommends that the Potatoes should be covered with dry earth. They may be laid in pits, or pies, as they are sometimes called, as usual, perhaps a yard wide and a yard high in the middle, then covered with dry earth a spade-blade thick, and then thatched or covered with the Potato leaves or straw. Ground may be rendered dry enough for it by digging a ditch round the pit a foot below the bottom of it.——*R. W.*—By all means try the experiment: plant a few rows of them early in November, fully six inches deep. Plant them whole; whether frost will hurt them or not will be determined by the result you obtain: the object of your experiment will be to ascertain that. From what little evidence exists on the subject, it seems probable that in many districts Potatoes may be planted in autumn with advantage.

Rot in Sheep.—*W. C.*—Salt is unquestionably the best preventive of the rot in sheep; but I believe that the idea that either Alder bushes or the web of the gossamer has any influence in the matter is altogether fallacious. It is not cold land, merely retentive of moisture, that is most apt to rot, but rather rich wet pastures, most susceptible of the influence of the sun, and on which vegetable decomposition readily takes place. Coincidences are very frequently supposed to stand to one another in the relation of cause and effect, and in the case in question they must have led to the supposition that Alder bushes and gossamer webs were preventives of the rot.—*W. C. S.*

Rye.—*R. Hinde.*—Your specimen appears to be that of true Rye. It is impossible, we think, that any such influence as you suggest could have been exerted by the last year's Wheat.

Sulphate of Iron.—*An Original Subscriber.*—Sulphate of iron will not injure the feet of horses nor their clothing, otherwise than staining them of a black colour, if the iron be in solution.—*W. C. S.*

Thistle.—*O. P. Q.*—We have perfect confidence in saying that unremitting perseverance in cutting off these weeds whenever they appear will ultimately kill them. It may take two years to do this—perhaps three; but you have only to choose between this and ploughing up your land, fallowing for a couple of years, and laying it down again.

To Architects.—*A Subscriber of some years' standing*, will be obliged for any effectual method of preparing a new wall so as to receive colouring. At present the fresh lime eats it away as soon as it is put on. If patience alone is wanted, how long will it be, in ordinary circumstances, before the walls are dry without a fire? We apprehend at least twelve months.

Top dressing for Pasture.—*G. M.*—In all probability the application of 20 bushels of fine bone-dust per acre, now, would be highly beneficial.

Variety of Wheat.—*J. D. Piper.*—Your specimen is that of a variety of large-berried Wheat, in very thickly compressed and well filled ears.

*** As usual many communications have been received too late.

Markets.

SMITHFIELD, Monday, Oct. 7.—Per stone of 8 lbs.

Best Scots, Herefords, &c	3s	8 to 4s	0	Best Downs & Half-breds	3s	8 to 4s	0
Best Short Horns	3	6	3	10	Best Long-wools	3	6	3	10
Second quality Beasts	2	8	3	4	Ewes and second quality	3	0	3	6
Calves	3	0	4	0	Lambs	3	8	4	4
Pigs	3	4	4	0					

Beasts, 4170; Sheep and Lambs, 26,240; Calves, 100; Pigs, 360.

We have a larger supply of Beasts than any day this season, and a great majority of very middling quality; the best descriptions for the most part maintain their price, although several very good Scots only make 3s 10d, and Short-horns 3s 8d per 8 lbs; inferior Beef is sold very low—indeed a great deal cannot be sold at all; very many remain unsold. The supply of Sheep continues about the same; the demand is rather increased; on the most selling qualities there is an advance of 2d per 8 lbs since last Monday. Veal-trade is excessively heavy, very few indeed make 4s; second quality are very low. Pork-trade is hardly so good.

FRIDAY, Oct. 11.

We have a large supply of middling Beef, which is very unselling, making from 2s 8d to 3s 2d, the best Scots, &c., about 3s 10d, and Short horns 3s 8d per 8 lbs. Trade is very heavy indeed, owing to the extreme dulness at the dead markets during the week. There is a fair supply of Sheep for the time of year, the demand being very small; about the same prices as on Monday are obtained, except for Ewes, which are fully 2d per 8 lbs lower. Lamb is now nearly out of the Market, and we shall cease to quote it; it now makes no more than Mutton. Veal trade is very bad; the best Calves scarcely make 4s, and many of second quality are sold at from 3s to 3s 4d. Pork is a little better.

Beasts, 771; Sheep, 5280; Calves, 241; Pigs, 370.

41, West Smithfield.

POTATOES.—Southwark Waterside, Oct. 7.

Several cargoes of Cornish Reds arrived during the past week, which were opened at 70s, but at the close 65s was submitted to. There being only one cargo of Scotch Reds in the Market they realised 70s. The York Reds have not yet made their appearance.

COVENT GARDEN, October 12.—The continuance of [illegible] weather has caused very large supplies of everything in [illegible] be brought into the market; but trade is far [illegible] The remarks on Pine-apples made last week [illegible] present. Hothouse Grapes, both Black and White [illegible] Portugals are a little dearer. Potatoes are becoming very scarce and are considerably advanced in price. Plums are also getting scarce and dear. Damsons are, however, tolerably well supplied and have not altered in price since last week. Apples and Pears are offered at the same prices as quoted in our last report; they are good in quality and are very abundantly supplied. A [illegible] quantity of bitter Oranges are yet in the market [illegible] fered at about 20s. per 100. Large supplies of Walnuts have been brought during the week—they bring from 4s to 5s per bushel. Shelled Walnuts are also plentiful. We have had a good supply of Keen's Seedling Strawberry. Among vegetables we continues to be pretty well supplied: and Brocoli is still sufficient for the demand. Brussels Sprouts have risen in price during the week. A few Peas are still [illegible] now nearly over for the season. French Beans, although good in quality—they bring from 2s. 6d. to [illegible] per pound. Artichokes are very scarce. Of Carrots and Turnips there is plenty; and Cabbages are quite sufficient for the demand. Some good samples of Savoys have just made their appearance in the market. Of Celery the red sort is plentiful, but the white is rather scarce—both kinds are excellent in quality. Lettuces, Endive, and most other kinds of salading, are abundant. Cut flowers chiefly consist of Achimenes coccinea, Phlox Drummondii, Erythrina crista-galli, Gladiolus psittacinus, scarlet Pelargoniums, Verbenas, Heaths, Camellias, Fuchsias, Amaryllises, Carnations, and Roses.

FRUITS.

Spinach, per sieve, 1s 6d to 2s	Chilis, per 100, 1s 6d to 2s

HOPS, Friday, Oct. 11.

The Market continues to advance for all good Hops. Duty, 120,000*l.*

Patterson & Smith, Hop-Factors.

MARK-LANE, Monday, Oct. 7.

The supply of English Wheat from the adjacent counties was again moderate this morning; fine samples, being scarce, sold readily at the terms of this day week, but secondary qualities are difficult to quit at a reduction of 1s. to 2s. per qr. The demand for Foreign was limited, but its value is fully supported, particularly of fine descriptions.—Barley is firm at our quotations.—Beans and White Peas are unaltered in value, but Maple in some instances command a trifling advance.—The supply of Irish Oats is large, and consists principally of New, for which the late terms are unwillingly complied with; Old and Foreign are firm at last week's prices.

Friday, Oct. 11.

The arrivals of all Corn during the week have been moderate, and the Market since Monday was thinly attended; Wheat, either English or Foreign, has met a very limited inquiry: the former may be purchased on rather lower terms, but the value of the latter is maintained.—Canada Flour sells slowly at 25s. to 26s. per barrel.—In Barley, Beans, and Peas we observe no alteration, but the prices of the two first articles have rather a tendency to advance.—In Oats a fair business has been done, and they are held firmly for Monday's quotations.

CHAPMAN'S KIDNEY POTATOES—CHARLES [illegible]OMAS CHAPMAN, of Brentford End, Isleworth, [illegible] obliged to disappoint numerous applicants for their [illegible] say that they will execute orders at the taking up [illegible] shel; and that persons may see the quality and [illegible] at the time, they will also give instructions [illegible] them, and plant them at the proper season.—Brentford End, October 11, 1844.

FOR FRAMES, GREENHOUSES, &c.

JOHN HAYES respectfully offers his Composition for rendering Brown Holland, Calico, and Irish Linen Transparent and Waterproof. His own Greenhouse is covered with cloth prepared with this Composition, and answers admirably, the cloth requiring only a coat of boiled oil once a year to render it as lasting as the wood frames; and the plants, which require only half the usual quantity of water, are more vigorous and healthy than under glass.

Specimens of the prepared Cloth may be seen at Messrs. BARRAND BUTLEY'S, 412 Strand: of whom, or at his Nursery, West street, Farnham, Surrey, the Composition may be had, at 3s. 2d. the quart bottle, sufficient for 100 feet of cloth.

WANTED, a GREENHOUSE, immediately, for a Private Garden; a substantially-built, second-hand House, in a good state of repair, from 18 to 20 feet long, by 12 to 14 feet wide.—Apply, by letter only, to Mr. SAYERS, Builder, Wandsworth, with particulars of size and price.

BOG EARTH and LOAM for PLANTS.—Good [illegible]wn Bog Earth and Mellow Sandy Loam, in excellent condition for potting, &c. (having been dug four years since), may be had by applying to B. BURT, Wimbledon, Surrey. Cartage according to distance.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

Sales by Auction.

SIX DAYS' SALE OF VALUABLE NURSERY STOCK.

MESSRS. PROTHEROE & MORRIS will submit to Public Competition, by Auction, at the American Nursery, Leytonstone, Essex (about one mile from the Railway Station, Stratford,, on Monday, 21st October, 1844, and five following days, at 11 o'clock, (to close Executors' accounts), the celebrated NURSERY STOCK, consisting of the choicest kinds of Fruit and Forest Trees, fine Evergreens, Ornamental, Deciduous and American Plants, of every variety, in considerable quantities, and lotted to suit every description of purchasers. The Stock is particularly worthy the attention of Noblemen and Gentlemen laying out their grounds, from its having many rare specimens that are only to be found in first-rate collections (also of the Trade, from its excellence), and comprising several thousands Azaleas, Rhododendrons, Ledums, Andromeda, all in fine condition for potting, being well furnished with bloom buds.

N.B. The ground is proverbial for safety of removal, the mould adhering to the roots. May be viewed prior to the Sale. Catalogues, One Shilling each, returnable to purchasers, may be had of the principal Seedsmen in London, at the Auction Mart, and of the Auctioneers, Leytonstone, Essex.

ISLINGTON NURSERY.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietor to submit to Public Competition, on MONDAY, 14th October, 1844, and 2 following days, at 11 o'clock, (in consequence of the ground being required for building,) a portion of the valuable NURSERY STOCK, consisting of about five thousand Belgian Azaleas, in 40 fine varieties, several thousands fine Hybrid Rhododendrons, well furnished with bloom buds; Green and Var. Hollies, Chinese and Siberian Arborvitæ, about five thousand Laurels, with a fine assortment of Fruit and Forest Trees, Flowering Shrubs, &c.

May be viewed prior to the Sale. Catalogues may be had on the Premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. FRANKLIN (in consequence of his Lease having expired and the ground let for building) to submit to Public Competition, on the Premises, Cottage-place, City Road, On THURSDAY, October 17th, 1844, at 11 o'clock, the whole of his VALUABLE STOCK, consisting of named Seedling Tulips, Auriculas, Carnations, Picotees, and Pinks, Greenhouse and Herbaceous Plants; a capital Greenhouse, 20 ft. by 11 ft.; and sundry Effects. May be viewed prior to sale. Catalogues may be had on the Premises; of the principal Seedsmen; and of the Auctioneers, Leytonstone.

EXTENSIVE SALE OF NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS beg to announce they have received instructions to sell by Auction, on the Premises, Windmill-lane, Camberwell, on Monday, 28th of October, 1844, and following days, at Eleven o'clock, a most valuable and varied collection of Hardy Trees, Shrubs, American Plants, Evergreens, blooming Camellias, Ericas, &c. Amongst the stock will be found some fine bearing Mulberries, and several hundred of fine straight young plants of ditto. There are also fine Magnolias of sorts, strong Vines in pots, Climbing and other Roses, a first-rate collection of choice American Plants, and other valuable Shrubs, affording a most eligible opportunity for Nurserymen providing themselves with healthy stock. A portion of the American Plants, Shrubs, &c., will be lotted in varied collection to suit all customers. Catalogues may be had of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

NURSERY STOCK.

TO BE SOLD BY AUCTION, by Mr. J. KING, on the Premises, Acre-lane, Brixton, on MONDAY, Oct. 14, 1844, and following day, precisely at 11 each day, the property of Mr. Dawson; consisting of a collection of EVERGREEN and DECIDUOUS SHRUBS, a large stock of Fruit and Forest-trees, Camellias, and other Greenhouse Plants, &c. &c. To be viewed the Sale; Catalogues on the Premises; Mr. CLARK, Seedsman, Bishopsgate-street; and of the Auctioneer, Hackney-road.

TO MARKET GARDENERS.

TO LET a SMALL COTTAGE, with six Acres of good Market-Garden Ground; and Crop to be Sold, with Gardening Utensils. Rent very low.—Direct, post paid, to G. BELL, Hornsey Road.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for AGRICULTURAL and HORTICULTURAL PURPOSES.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

WHEAT-SOWING.

GUANO; Genuine Peruvian, Bolivian, and Ichaboe, on Sale; also Potter's Guano, Gypsum, Sulphuric Acid, Sulphates of Iron and Copper, and all other manures. Synopsis of prices, and mode of use, on application, &c.—Apply to MARK FOTHERGILL, 40, Upper Thames street.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL;

And by their Agents,

COTESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.

47, Lime-street, Oct. 11, 1844.

GUANO for SALE, in Bags of 1 cwt. each, just landed, with a succession of cargoes to arrive.—Successive years' experience has unquestionably proved that Genuine Guano is the simplest, cheapest, and best Manure within the reach of the Agriculturist. The only reasonable anxiety which now remains is to procure the Guano unadulterated, and to obtain such practical directions for using the Manure as shall fully develop its productive powers. To secure to buyers these indispensable requisites, with each purchase will be given a warranted chemical analysis of quality, and also a copy of the recently-published Pamphlet, "Practical Instructions for using Guano as a Manure, illustrated by Practical Results."

Large parcels will be delivered direct from the ship or waterside premises; smaller quantities may be had at the warehouses, 24 and 25, Billiter-street, or delivered within any reasonable distance at a trifling additional cost. Apply to JAMES CLARK, 24, Billiter-street.

MR. LAWES' MANURES.—Mixture for Wheat, 7l. per ton; Super-phosphate of Lime, 7l. per ton. To be had at the Factory, Deptford Creek, near London.

Super-phosphate of Lime, in a concentrated form, may also be procured at Messrs. WARNER'S, 28, Cornhill, in 7 lb. packets, price 1s.

POTTER'S GUANO MANURE is the only Guano that can positively be depended upon, and has stood the test of three seasons. The imported article, it is well known, is seldom twice alike, even when genuine, and is subject to a most extensive system of adulteration. Orders addressed early to the Works, 28, Upper Fore street, Lambeth, will have instant attention. Testimonials will be sent per post, if required.

POTTER'S LIQUID GUANO may be had as usual of most Chemists and Seedsmen.

*** Beware of being imposed upon by inefficacious imitations.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIELD (late Mr. Mitchell), Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No. 5A, Hawes-road, Kentish Town.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE Attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed: Garden, Ship, and Barge Pumps; also those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold Liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 6a, Dorset-street, Fleet-street, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings, its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1d. per foot, super. A discount to the trade. THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and OBTAINED the PRIZE for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Buildings, Bunhill-row, London.

TO LANDOWNERS, AGRICULTURISTS, BUILDERS, &c.

McKIBBIN'S Improved ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY.

The disadvantages attending other materials used in roofing, preventing, to a great extent, many useful houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will in a great measure—and in some instances altogether—obviate them, and prove most serviceable from its lightness, durability, and impermeability to water and damp, in covering Houses, Cattle sheds, Workshops, Ropewalks, &c., and for the sides, as well as roofs, of light structures for plants, being likewise a non-conductor of heat; besides its economy in repairs, the timber where it is used may be so light as to save its whole expense; it requires no other coping, and may be applied by any person of common ingenuity; being flexible and portable also, it is free from breakage, the expense of carriage is inconsiderable in comparison with slates, tiles, &c., and it is not liable to contraction like zinc.

Sold in sheets 32 inches by 20, at 5d. each (being less than 9s. 6d. per square of 100 feet), with printed directions for applying them, same as adopted at the Government Dock-yards and various other public buildings.

Orders will meet with prompt attention if addressed to H. C. BOWDEN, 18, East India Chambers, Leadenhall street, London, or to the following agents:—Liverpool, Messrs. Grueber & Co., 11, Manesty-lane; Plymouth, Thomas Stevens, Esq.; Birmingham, William R. Loyd, Esq.; Sunderland and Newcastle-on-Tyne, Messrs. John Ritson and Sons; Hull, William Ward, Esq.; Bristol, Messrs. Moor and Hewitts; Ramsgate and Deal, Messrs. Edward Hodges & Co.; Whitehaven, William Todd, Esq.; Glasgow, Malcolm Carmichael, Esq., St. Enoch-square, Cork, Messrs. Richard Wallis & Co.; Belfast, Messrs. Grueber & Co., Dunbar's Dock; who have also on sale McKIBBIN'S improved SHEATHING, BOILER, RAILWAY, and other FELT.

*** The "IMPROVED ROOFING FELT" will be found much more durable than the Common Felt made in lengths, and not subject, like it or continuous sheets of other material, to be stripped by storm; it can also be more easily repaired, and from the simple mode of application recommended, the wet cannot percolate through nail-holes, being only fastened down at the overlaps.

PORTER'S GALVANIZED CORRUGATED AND PLAIN IRON ROOFING, and IRON HURDLE and FENCE WORKS, Grove, Southwark. The Patent Galvanized Iron Co.'s (Sorel's) Process, is now being used for the Roofing of the New Houses of Parliament; at Woolwich Dockyard, by the Trinity Board, &c. It is particularly suited for the Colonies, and is shipped by J. PORTER to the East and West Indies, Ceylon, &c.; also supplied by him to several English, and to the Jamaica Railway Companies. Moveable Feeding Sheds and Pens, Farmyard and Fireproof Buildings of all kinds. A new description of Galvanized Iron Open Gutter covered with tile for the circulation of hot water, much cheaper than any other kind. The Trade supplied with Corrugated Plates, Galvanized or not, and with Iron Fences of all kinds.

DRAINING OF LAND.

THE A LEVEL, designed for the Use of Workmen, in preserving a uniform fall in Drains and Water-courses. In consequence of the approval expressed and the demand made for these Levels at the recent Southampton Show, Mr. Bailey Denton has arranged with an eminent London Mathematical Instrument Maker to make them in any number required. Price 30*s*.

This Level is as accurate as a spirit-level, and so simple, that the workman unable to read can use it with facility. When closed it forms a 5-feet staff.

Orders addressed to Mr. Denton, Land Agent, 9, Gray's Inn-square, London; or to Mr. Charnock, Wakefield, Yorkshire, will insure a perfect instrument.

AGRICULTURAL DRAINING. — The DERBY LEVEL.—The attention of persons Draining their land is directed to this efficient but simple Instrument, presumed to be all that can be required for the purpose, and its price such as to place it within the reach of all. To be had of the Maker,

J. Davis, Optician, Derby.

SEED WHEAT.—Donnington, near Stow, Gloucestershire.—From the number of testimonials received of the extraordinary crops produced both this year and last, ROBERT BEMAN is induced to offer to the public his Red Cluster Wheat, which both seasons has produced 60 bushels per acre in several instances; and, having been grown upon old turf, and hand-picked before it was planted, it is beautiful seed, and perfectly clean. Price 7*s*. 6*d*. per bushel.

R. B. has likewise a small quantity of the celebrated Whitfield Red Straw White Wheat to dispose of. Price 8*s*. per bushel.

Orders, accompanied by a remittance or good reference, punctually attended to. Sacks marked 1*s*. 6*d*. each.

SEED WHEAT.

J. D. PIPER, of Colne Engaine, Essex, (Member of the Royal Agricultural Society), has been four years raising two new Stocks of Wheat, viz., Piper's "Thick-set," and "Colne Whitechaff Red." At the last Southampton Meeting two sheaves of these Wheats were exhibited outside (notice not having been given in time for their admission inside), where they produced much excitement, and 6*d*. per ear was offered for them. Last year, in the same field, side by side, the Piper's Thick-set grew eight bushels and a half, and the Colne Whitechaff Red five bushels and a half more per acre than the most prolific Wheat grown in the neighbourhood. Last autumn J. D. P. measured a quarter of an acre off his field, and dibbled the Thick-set in rows a foot apart, and one bushel per acre; and though the plant was partially destroyed by the slug in the winter, and a good sprinkling of self-sown Potatoes were left to grow, still the yield was 14 bushels and a half, being equal to 14 sacks and 2 bushels per acre. One person this year grew 15 sacks and 2 bushels, another 14 sacks, and another 13 sacks per acre. One parcel weighed 64½ lbs. per bushel. This is, perhaps, the stiffest-strawed Wheat in England, and is adapted for strong or hollow bottom ground, and is not likely to get laid. J. D. P. will send to London, or to any place within ten miles of Colne, carriage free, and he will be glad to receive a post-office order, or reference to some house in London for the money, with the order for the Wheat. When it is all sold, J. D. P. promises to inform the Public, by an advertisement in this Paper; but if he should get any post-office orders after it is all sold, he will return them. The price is regulated according to the yield. Thick-set, 15*s*. per bushel; Colne Whitechaff Red, 9*s*. per bushel. Samples of the above, both threshed and in the straw, may be seen at our Office. N.B.—J. D. P. advertised in the two principal papers in Essex, where the above Wheat was growing, in order that Agriculturists might see it and judge for themselves of the quality and quantity.

WHEAT-SOWING.

FREDERICK BRAIN begs to call the attention of the Agricultural world to his GUANO MANURE, prepared expressly for Wheat crops: it abounds in all the ingredients that are necessary for a good grain crop. He particularly solicits persons who found the Foreign Guano a failure last season to give his a trial, it being much more powerful, and free from adulteration, so justly complained of in the Foreign by Agriculturists, as well as by all the leading Agricultural Journals.

Testimonial to Brain's Guano Manure.—"5 A, Hawley Road, Kentish Town, London, Aug. 15, 1844.—This is to certify that we have subjected Brain's Guano to a most patient and rigorous analysis, and find it contains all the necessary constituents of a good manure, and is well calculated to give fertility to a soil which is either naturally barren, or has been exhausted by over-cropping, by supplying the land with those substances which are absolutely requisite to a healthy vegetation: (it is not adulterated, and can always be depended on, being of uniform composition)—(Signed) John Mitchell and Frederick Field, Analytical Chemists, late of the Royal Polytechnic Institution, London."

Also, Brain's highly-concentrated LIQUID GUANO, for Grass Lands, Gardens, Shrubberies, Hothouses, and Conservatories, price 1*s*. 9*d*. per quart bottle, with full directions for use, (enough for 80 gallons of Liquid Manure), to be had of most respectable Florists, Seedsmen, and Chemists in town and country.

Works, Thomas-st., Duke-st., Stamford-st., Blackfriars-road.

J. R. and A. RANSOME, Ipswich, have published a Descriptive Catalogue, with Cuts, of their AGRICULTURAL IMPLEMENTS and MACHINES, which may be had by post, the order being accompanied by six penny stamps.

Price Sixpence, free by post.

The Railway Chronicle

ELEMENTS OF PRACTICAL AGRICULTURE.

THE BREEDS OF THE DOMESTICATED ANIMALS OF GREAT BRITAIN. 2 vols., 4to., with 56 coloured Plates, 16*l*. 16*s*.

London: Longman, Brown, Green, and Longmans.

RAY SOCIETY, instituted 2d February, 1844.—This Society has been formed upon the principle of the Parker, Camden, Sydenham, and other Societies, for the purpose of securing to those attached to the study of Natural History, such Works on the various branches of Zoology and Botany as could not be obtained by other means; and will consist of original works; of new editions of works of established merit; of rare tracts and MSS.; and of translations and reprints of foreign works. Every subscriber of One Guinea annually will be considered a member of the Society, and will be entitled to a copy of every work published by the Society. The Council have great pleasure in stating that the number of Members already exceeds 300, and beg to call the attention of their friends to the necessity of sending in their names as early as possible, in order that they may be enabled to determine the number of copies of their works which they ought to print. The Council hope to publish two volumes before Christmas, the first of which will consist of translations from the German and Italian, of Reports on the progress of Zoology and Botany during the last few years.

Communications on the business of the Society are requested to be addressed to the Secretaries, Dr. George Johnston, Berwick-upon-Tweed, and Dr. Lankester, Golden-square, London. Subscriptions to be sent, by post-office order or check, to the Treasurer, J. S. Bowerbank, Esq., 45, Park-street, Islington.

George Johnstone, M.D.
Edwin Lankester, M.D. } Secretaries.

DOMESTIC COMFORTS.—READ'S STOMACH and ENEMA PUMPS have long had the reputation of being the best Instruments of the kind ever offered to the public (vide the Life of Sir A. Cooper). This distinguished patronage has induced some unprincipled adventurers to palm upon the public imitations of Read's Patent Instruments, which has been made known to the Patentee by the number of spurious instruments which are daily sent to him from all parts of the Kingdom, and frequently from India, for repair, some not worth the expense of carriage. As a protection in future, J. Read has directions from the Hon. East India Company to place their mark on all his instruments sent to their Presidencies. The above are manufactured only by the Patentee, 35, Regent-circus, Piccadilly. Likewise improved Enema Fountains, with tubes that require no fixing or screwing, or the incumbrance of a stop-cock, &c., but which are as durable as the Instrument itself, and are not affected by the hottest climate. May be seen and proved at 35, Regent-circus, Piccadilly.

N.B.—Observe the Words "Read's Patent," without which none are genuine.

TANNER'S VITREOUS CLOTH, a SUBSTITUTE for GLASS for HORTICULTURAL PURPOSES.—The above recommends itself to the notice of Florists and Horticulturists, as producing effects superior to Glass, at a less expense. The support the Proprietor has received from very many highly respectable Florists encourages him to consider that his labours have not been misapplied in bringing before the public an article so generally required. Price of cloth, 7-8ths of a yard wide, thin, 2*s*. 6*d*. per yard.; stout, 3*s*. 1 yard wide, 3*s*. 6*d*. Price of Fluid (for renewing the cloth after lengthened service), 4*s*. 6*d*. and 2*s*. 6*d*. per bottle. Manufactured only by N. W. Tanner, Chemist, Exeter; and Sold by Messrs. Butler and Muckley, Covent-garden, London; Mr. Cunningham, Paradise-street, Liverpool; Messrs. Lucombe and Pince, Exeter Nursery.

H. WALKER'S NEEDLES (by Authority the "Queen's Own") have large eyes, easily threaded, (even by blind persons), and improved points, temper, and finish. Each paper is labelled with a likeness of Her Majesty or His Royal Highness Prince Albert, in relief, on coloured grounds. Every quality of Needles, Fish-hooks, Hooks-and-eyes, Steel Pens, &c., for shipping. These Needles or Pens for the home trade are sent free, by post, by any respectable dealer, on receipt of thirteen penny stamps for every shilling value.

H. Walker, manufacturer to the Queen, No. 1 (late 20), Maiden-lane, Wood-street, London.

BURBIDGE and HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

SILVER TEA-SERVICES.—A. B. SAVORY and SONS, Manufacturing Silversmiths, 14, Cornhill, London, opposite the Bank of England, submit the price of the following Silver Tea and Coffee Services. The Cottage Pattern is plain, standing on shell feet, the tea and coffee-pot with a flower ornament on the lids. The King's Pattern is richly embossed with flowers and scrolls. The shape of either is new and elegant.

Cottage Pattern.			*King's Pattern.*		
Strong Silver Tea-pot	£12	0*s*.	Strong Silver Tea-pot	£12	0*s*.
Ditto Sugar-basin	6	16	Ditto Sugar-basin	7	10
Ditto Milk Ewer	4	10	Ditto Cream Ewer	5	10
Ditto Coffee-pot	15	0	Ditto Coffee-pot	15	0
Complete ...	£38	6	Complete ...	£40	0

A variety of upwards of 50 tea and coffee services may be seen in the show-rooms, where may be selected every article of silver requisite for the side-board or plate-chest. Pamphlets of prices, illustrated with sketches of the various articles, gratis, and forwarded, postage-free, to any part of the kingdom.—A. B. Savory and Sons, 14, Cornhill, London, opposite the Bank of England.

Printed by William Bradbury, of No. 6, York place, Stoke Newington, and Frederick Mullett Evans, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, October 12, 1844.

The Newspaper.

SATURDAY, OCTOBER 12, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—
Trustees.—Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

LIFE ASSURANCE.

AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY.

CAPITAL £200,000—IN 2000 SHARES.

DIRECTORS.

Edward Barnard, Esq., F.R.S. | Gideon Colquhoun, Esq.
Robert Brooks, Esq. | C. E. Mangles, Esq.
Henry Buckle, Esq. | Richard Onlow, Esq.
John Henry Capper, Esq. | William Walker, Esq.

The advantages offered to EMIGRANTS to the Australasian Colonies by this Company are,—First, That no extra Premium is charged for Residence in any of the Australasian Colonies, except in New Zealand. Second, That no extra Premium is charged to those who Assure for the whole term of life, for one voyage out to the Australasian Colonies, and for one return voyage; and that Premiums may be paid and Claims settled in those Colonies. And to all Persons who wish to Assure their Lives, the Company offers unusually favourable Rates of Premium, participation in Profits, and the guarantee of an ample subscribed Capital.

Prospectuses and full Particulars may be obtained at the Offices of the Company, No. 126, Bishopsgate Street, corner of Cornhill, City.

NORTH BRITISH INSURANCE COMPANY, Established 1809. His Grace the Duke of Sutherland, K.G., President; Sir Peter Laurie, Alderman, Chairman of the London Board; Francis Warden, Esq. (Director H.E.I.C.), Vice Chairman; John Webster, M.D., F.R.S., 21, Brook-street, Physician.

THIRD DIVISION OF PROFITS.

The Third Septennial Investigation of the Company's Affairs will take place on the 31st December next. Parties joining the Profit Scheme in the interim, will participate in the Bonus to be then declared.

This Institution is incorporated by Royal Charter, and is so constituted as to afford the Benefits of Life Assurance in their fullest extent to Policy Holders, combined with perfect security, in a fully subscribed Capital of One Million Sterling, besides an Accumulated Premium Fund, exceeding Four Hundred Thousand Pounds, and an Annual Revenue of Eighty-seven Thousand Pounds.

Fire Insurances may be effected on Private Houses, Country Mansions, &c., at the lowest rate of Premium.

A Prospectus, containing Tables of Premiums, with the names of the President, Vice Presidents, Directors, and Managers, who are all responsible Partners, may be obtained of Messrs. B. and M. BOYD, 4, New Bank Buildings, or of the Actuary, 10, Pall Mall East.

JOHN KING, Actuary.

John Richards, Jun., Esq., F.S.A., Mayor of Reading.
George Alfred Walker, Esq., St. James's Place.

Consulting Actuary—W. Ratray, Esq., King William-st., City.

THE GREATEST PRESENT BENEFIT, AND THE GREATEST FUTURE ADVANTAGES to those who attain the average duration of Life are secured to the Assured in this Office, *a combination of advantages presented by no other in London.*

The principle adopted in the distribution of the profits is *peculiar to this office*, and is at once safe, equitable, and favourable to young and good lives. The surplus is reserved for Members who survive the period at which their premiums, with accumulated interest at 5 per cent., shall amount to the sums assured, and may be received in cash, or applied in the reduction of the future premiums, or to the increase of the sum assured.

The Premiums are deduced from the Government experience, and are accurately adjusted to the several ages. At early and middle life they are about *one fourth lower than at most other offices.*

All the objects of Life Assurance may be effectually accomplished at this Office.

Every facility and information afforded on application at the Office, 17, New Bridge-street, Blackfriars.

CHARLES JAMES THICKE, Resident Secretary.

FARMERS' AND GRAZIERS' MUTUAL CATTLE INSURANCE ASSOCIATION. OFFICES—366, STRAND, LONDON.

The especial object of this Association is to give to Farmers, Graziers, and Owners of Cattle, the best means of protecting themselves against losses by those diseases and accidents which they can neither foresee nor control, but which have hitherto been most injurious, and often ruinous to thousands.

PREMIUMS.

Neat Cattle and Cows, against death by all diseases and accidents save *pleuro pneumonia*, usually called the "Epidemic", 30*s.* per 100*l.* value.

Including *pleuro pneumonia*, 50*s.* per cent. additional; being at the rate of 50*s.* per 100*l.* value.

Pleuro pneumonia will not be taken alone at this latter rate.

Prospectuses and every information may be obtained at the Office, if by letters, post-paid, addressed to WILLIAM SHAW, Esq., 366, Strand, London; or the Agents in the Country.

N.B. References can be given to several persons in Dorsetshire, Cheshire, Lancashire, Nottinghamshire, Yorkshire, &c. who have experienced losses, and have been promptly paid.

HENRY FLOWER, Secretary.

WANTED, a small Four-years-old GUERNSEY HEIFER, to calve her second Calf at any time between this and the middle of November. She must be a good Milker, perfectly sound and quiet, colour yellow and white. Particulars of price, &c., delivered at a Railway Station, &c., to be directed (prepaid) to X., Mr. PRESTON'S, Picton-st., Bristol.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Horticultural Builders and Hot-water Apparatus Manufacturers, invite the attention of the Horticultural world to their improved Plan of Bottom-Heat, now becoming so universally adopted. From the extensive practice they have been honoured with for twenty years, in designing and building Horticultural erections of every description, and erecting their Hot-water Apparatus to buildings of every description to which heat is applicable, their boilers are warranted to be the most efficient of any yet invented, which can be seen in use on their premises, and at most of the London Nurseries. Glazed Lights and Frames of various sizes kept ready at their Manufactory, Gloucester-place, Chelsea, near Sloane-square.

TO LADIES.

ROWLAND'S KALYDOR.—This Royally Patronised and universally adopted Specific is a balmy, odoriferous, creamy Liquid, composed chiefly of extracts from the most rare Flowers and Herbs of an Eastern Clime. Its discovery was no less singular (by a Lady of rank), than its effects have been felicitous, during the last thirty years. It is the mildest and most efficacious preparation ever known for dissipating Tan, Pimples, Freckles, Discolorations, and other Disfigurements of the Skin. The radiant bloom it imparts to the Cheek, and the softness and delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet.

Gentlemen will find it peculiarly grateful after shaving, in allaying irritation of the skin, and in rendering it soft and smooth.

Price 4*s.* 6*d.* and 8*s.* 6*d.* per Bottle, duty included.

CAUTION.—The great demand for this article excites the cupidity of *unprincipled Shopkeepers*, who vend the most *spurious trash* as the "GENUINE KALYDOR;"—whereas the genuine article is prepared solely by A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "KALYDOR." The genuine article has the words "ROWLAND'S KALYDOR" on the Wrapper.

*** All others are FRAUDULENT COUNTERFEITS!!!

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites: more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester: Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

REAL SHEFFIELD PLATED DISH COVERS, at prices hitherto unattempted. THOMAS WEST, 18, Ludgate-street, London, having received a large supply direct from the manufactory at Sheffield, offers the best Meat Dish Covers as follow:—Cottage Pattern—1 Cover of 20 inches, 3*l.* 12*s.*; 1 do. of 18 inches, 3*l.* 3*s.*; 2 do. of 14 inches, 4*l.* 8*s.*; the set of 4, complete, 11*l.* 10*s.* ONLY. Double Dome Pattern—1 Cover of 20 in., 4*l.* 16*s*; 1 do. of 18 inches, 3*l.* 19*s.*; 2 do. of 14 inches, 5*l.* 5*s.*; the set of 4, complete, 14*l.* ONLY. In noticing the prices of the above goods, T. W. ventures to assert they are superior to many advertised at a much higher price. Best Wrought Silver Spoons and Forks as usual, Fiddle Pattern, 7*s.* 2*d.* per oz.; Queen's Pattern, 7*s.* 4*d.* per oz. Superior Watches and Fine Gold Jewellery, cheaper than any house in London. West's Hand-book, with 100 engravings, and full of useful information, is just published, and may be had gratis, and post free, on application to T. WEST, Silversmith, 18, Ludgate-street, London.

IMPORTANT to the FASHIONABLE WORLD.—By far the most influential of all the graces that contribute to personal adornment is the Hair. Its recovery, preservation, and improvement proportionably concern the élégantes of our fashionable circles, and any information which will insure these desirable results will be hailed as an inestimable boon. The following extract from the letter of a respectable chemist in Bridlington will be read with the highest interest:—

"A lady, a customer of mine, has found great benefit from the use of your Balm. About six months ago her hair nearly all fell off. I recommended her to try your Balm of Columbia, which she did. In the course of a few applications the hair ceased to fall off. Before she had used one 3*s.* 6*d.* bottle it began to grow very profusely, and she has now a very beautiful head of hair. "I am, gentlemen, yours respectfully,

"WM. SMITH,

"Chemist and Druggist, Market-place, Bridlington.

"To Messrs. C. and A. Oldridge.—March 13, 1844."

C. and A. OLDRIDGE'S BALM of COLUMBIA causes the Hair to curl beautifully, frees it from scurf, and stops it from falling off, and a few bottles generally restore it again; it also prevents grayness. 3*s* 6*d.*, 6*s.*, and 11*s.* per bottle. No other prices are genuine.

OLDRIDGE'S BALM, 1, Wellington street, the second house from the Strand.

News of the Week.

THE arrival of the King of the French in this country, on a visit to our Queen, whether we consider his remarkable career as a man and a statesman, or regard him as the head of a great and gallant people, is a political event of no ordinary importance. It confirms that policy of peace by which, amidst unparalleled difficulties, his clear sagacity has preserved the tranquillity of Europe for fourteen years; and is, at the same time, a proof of his continued desire to make France the rival of Great Britain in those arts alone which promote the happiness of mankind. The cordial good will which subsists between King [illegible] Philippe and Queen Victoria, as the representatives of the two greatest nations of the globe, cannot fail to be the source of real satisfaction to all classes in the country; and the enthusiastic welcome which His Majesty has received from the people at large is the best assurance which can be given to his subjects that the whole English nation shares in the sentiments of its Sovereign.—The revenue returns for the year and quarter, which ended on Thursday, show a very gratifying increase in the main sources of our national prosperity. The total increase on the year amounts to 1,395,349*l.*, and on the quarter to no less than 520,944*l.* The Customs, notwithstanding the reductions made by the new tariff, show an increase on the year of 1,723,165*l.*, and on the quarter of 473,347*l.* The Property-tax shows an increase of 106,413*l.* on the year, and a decrease of 89,193*l.* on the quarter, occasioned by the repayment of overcharges; so that it may now be said to have found its level. The Excise exhibits a small decrease on the quarter, which is attributed to the growing habits of temperance in the lower orders, and not to any diminution of their means. The Taxes show a decrease for the year, and an increase on the quarter; while the Stamps and Post-office, like the Customs, present an increase for both periods. The increase in the Post-office, which in July had reached 34,000*l.* for the year, and 10,000*l.* for the quarter, has now advanced to 82,000*l.* on the year, and 40,000*l.* on the quarter—a rate of increase which far surpasses the expectations of the public, and is the best omen of ultimate success.

In France, the King's visit to our Queen is the sole topic of the day, and the Opposition papers eagerly avail themselves of the circumstance to renew their attacks upon this country. Even the courtesies prepared for His Majesty and the officers of his fleet are regarded as so many insults to France, and the part which the Duke of Wellington has taken in the reception of the King is proclaimed as the crowning indignity offered by the British nation to the Revolution of July. The Ministerial papers, however, accept the spontaneous manifestations of English feeling as testimonies of cordiality and goodwill, and are not unmindful that the Duke of Wellington was the first who recognised the revolution which placed Louis-Philippe on his throne. Previous to His Majesty's departure from France, the Duc de Nemours was invested with all the powers of royalty during His Majesty's absence, with the title of Lieutenant-General of the Kingdom; and a royal ordinance was issued, by which the King granted an amnesty to nearly 60 political prisoners. From Tahiti we have accounts of another misunderstanding between the French commander and a British Officer, who was arrested by the French in the execution of his duty, and detained a prisoner for some hours by superior force. It appears, however, that the port was in a state of blockade, and that the French admiral lost no time in sending an apology for the interruption.—From Spain we have no accounts of any interest; and from Portugal we learn that the Cortes met on the 30th ult., when questions of confidence in the Ministry were incidentally raised in both Chambers, and carried by large majorities in their favour.

Home News.

VISIT OF THE KING OF THE FRENCH.—His Majesty Louis-Philippe arrived at Portsmouth at 9 o'clock on Tuesday morning. The squadron was signalled at St. Helen's shortly after 7 o'clock, and the guns of the Queen, 110, lying at Spithead, soon announced the approach of the royal squadron. Near the Queen at Spithead was anchored the St. Vincent, 120, and in a long line, stretching away towards the Nab, were the eight experimental gun brigs—their array being broken by anchored merchantmen, yachts, and small sailing craft, stretching backwards and forwards across Spithead. The firing of the Queen brought out the three regiments of the Line and the division of Royal Marines from their quarters, with their bands playing and colours flying, whilst the whole population thronged the beach. This general movement, combined with the display of flags streaming in every direction in the town, and covering the yachts and ships of war in the port, presented a scene of animation beyond all power of description. Every moment this scene increased in interest. The French squadron came on slowly and majestically, each ship of war saluting as it advanced, and each battery in turn taking up the salutes. The climax, however, was when the steamers entered the harbour. The royal steam-yacht Gomer, commanded by Admiral La Susse, passed the King's bastion about 9 o'clock, under a salute from that battery, and on coming to her moorings, opposite the Dockyard, she was received with royal honours, the yards of the Victory being manned, and a salute fired at the same moment. The French ensign was also hoisted at the fore of the Victory. His Excellency Count de St. Aulaire, with Count de Noailles, Count de Jarnac, Baron Talleyrand, and the other officers of the Embassy, on the Gomer coming to her moorings, proceeded in the Admiral's barge on board the yacht, for the purpose of paying their respects to His Majesty. Sir G. Cockburn, and the other

Lords of the Admiralty, followed in the Admiralty barge, and had the honour of being introduced to the King. The Mayor and Corporation of Portsmouth were admitted to an audience by His Majesty in the state cabin shortly after the Gomer came to her moorings. The deputation consisted of Mr. Casher (the Mayor), Mr. Rawlinson (the Recorder), 7 Aldermen, the town-clerk, and 24 Councillors. The Mayor having addressed the King in a few words expressive of the grateful sense the Corporation entertained of His Majesty's condescension, handed an address to the Recorder, who read it to the King. To this address His Majesty replied :—"Mr. Mayor, Aldermen, and Burgesses; Gentlemen,—With feelings of the highest gratification I receive the address of the Mayor and Corporation of this ancient borough; the kindly feeling manifested by which, so strongly recals to my mind the warm hospitality which I formerly experienced while resident in England. Last year I had the gratifying opportunity of, in some degree, testifying my respect and affection for Her Majesty Queen Victoria, and of receiving her with that attention and solicitude which is so much her due. I now feel rejoiced at the occasion afforded me of returning that visit and those courtesies of which I was last year the object. It is my anxious desire that feelings of the most friendly character should always subsist between Great Britain and France; this desire I believe to be cordially reciprocated by the people of both countries; and whilst my first duty is to France, my earnest efforts shall ever be exerted to promote and strengthen those friendly feelings and pacific relations which have so long and so advantageously subsisted between the two nations." His Majesty's reply, which was spoken in English, gave the greatest satisfaction. After it was delivered, he cordially shook hands with the members of the Corporation, and entering into familiar conversation with them, observed that he remembered many of the localities of Portsmouth since he had seen it last —40 years ago—mentioning the Point, the Sally-port, and the Fountain Hotel. The Recorder being a tall man, His Majesty observed that he occasionally struck his head against the beams of the cabin, and good-humouredly said, "We did not make allowance for your wig." The Mayor then requested to be favoured with a copy of His Majesty's speech, to which the King replied, "I have no copy: my words came from my heart." His Majesty then received the French Consul at Portsmouth, and several Consuls from the different ports who had come to meet him. Conversing in this manner, and receiving the respects and congratulations of the various official, Naval, and Military personages by whom the King was surrounded, about an hour passed away, and at half-past 10 a bustle on shore, in the direction of the Clarence Victualling-yard, and the appearance of the Royal Standard, announced that Prince Albert and the Duke of Wellington were at hand. An Admiralty barge conveyed them rapidly towards the Gomer, while the yards of the Victory, the Gomer herself, and of her attendant squadron were manned; a profusion of flags rose into the air from the deck of the royal steamer, which had previously only shown two or three, and at the same moment the firing recommenced on all sides, and the band on board the Gomer played the British national anthem. The barge was soon alongside. Prince Albert ascended first, and was heartily cheered. His Royal Highness was dressed in black, and looked well. On reaching the deck the King embraced him most cordially and kissed him on both cheeks. His Majesty then seized the Duke of Wellington with both hands, and welcomed his grace with a warmth of feeling which called forth repeated cheers from the crowds collected in the boats below. But a few moments elapsed ere the royal party made their appearance at the gangway for the purpose of disembarking. There was no mistaking King Louis-Philippe, even by those who were familiar with his features only through the medium of engravings. There was his bluff portly figure, strongly-marked and expressive countenance, and large gray whiskers. As he appeared at the gangway, a loud cheer broke forth—it was really a hearty ringing hurrah; and His Majesty appeared to feel and appreciate its cordiality. He bowed long and low, turning in every direction, and then stepped firmly down the ladder, followed by Prince Albert, the Duc de Montpensier, and the Duke of Wellington. The King wore a blue uniform; his son, a tall and good-looking young man, was attired in an artillery dress. The illustrious party appeared to chat familiarly together as they approached the landing place at the Clarence-yard. The barge shot rapidly ashore, followed by a regular crowd of boats, and loudly cheered on all sides. At the Clarence-yard, the King was received by the General in command, surrounded by his staff. Two lines of soldiery extended from the landing-place to the railway station, and on either hand a crowd, hurrying from point to point, and occupying every available eminence, raised cheers so lusty and continuous, as quite to drown the cannon and the music of the bands. A second barge, which followed closely upon that conveying the King, brought M. Guizot and Admiral Mackau, along with the noblemen and gentlemen of the royal suite. Two or three moments sufficed to bring the royal party, in several of her Majesty's carriages, from the waterside to the railway station. It was of course blockaded by anxious crowds, who kept up the tide of cheering with hearty good-will. A triumphal arch, erected over the entrance to the terminus, bore the inscription of "Louis-Philippe, Welcome to England." And thousands of honest voices vouched for the truth of that silent greeting. A number of ladies and gentlemen had been admitted within the station. They were ranged, the ladies in front, along the opposite side to that from which the train started. Their greetings were cordially acknowledged by the royal party. The King in particular seemed much affected by the evident heartiness of his reception, showing it by his manner as well as his words. The preparations for starting were quickly effected. The King, Prince Albert, and the Duc de Montpensier took their places in a splendid new carriage, built for the use of the Queen. The Duke of Wellington rode in his own carriage, placed upon a truck. On the engine were Mr. Chaplin, the chairman, and Mr. Locke, the engineer of the railway, who drove the train; and all being ready, amid a general and final cheer, the train shot rapidly away. Shortly after the landing of the King the French war steamer Elan slipped her moorings, and proceeded back to Tréport with intelligence of his Majesty's safe arrival. Portsmouth, the harbour in particular, continued very bustling and crowded. A number of the French officers landed, and hundreds of boats went cruising around the steamers of the squadron filled with spectators. The vessels in the harbour, which had been decorated, displayed their flags until sunset. Altogether, the morning's proceedings were very splendid, and the magnificence of the reception—a magnificence which all admired—was quite equalled by its sincerity and cordiality. At the Farnborough station the King was received with renewed demonstrations of respect. After a few minutes' delay, His Majesty and suite having passed through the state apartments, entered the Royal carriages, and proceeded, amidst a truly British burst of cheering, towards Windsor. The King of the French, Prince Albert, and the Duc de Montpensier occupied the first carriage. His Majesty, as the carriage proceeded at a slow pace up the slight acclivity towards the bridge, kept his hat off, and bowed and smiled in the most affable manner. Prince Albert also, who seemed in very good spirits, bowed repeatedly on either side. The young Duc de Montpensier, who looked a little pale, touched his military cap from time to time. A host of gentlemen and ladies on horseback, and in vehicles of various descriptions, who were assembled on the line of road and on the bridge, accompanied or followed the Royal *cortège* on its way, the cheering continuing till far out of sight. At ten minutes past two the guns in the Park announced to the inhabitants of Windsor that the King was approaching, and in a few minutes the royal carriages could be seen coming rapidly up the long avenue. The scene from the vestibule at this moment was beautiful in the extreme, and Her Majesty, who had received an intimation of the approach of the King, and had come into the vestibule to receive him, appeared to take much interest in the scene. At a quarter past two His Majesty and suite, in five carriages, entered the quadrangle. As soon as the royal carriage passed through George the Fourth's Gate to the entrance of the grand vestibule, Her Majesty, who looked exceedingly well, and was attired in a black silk dress, walked down to the carriage door to receive her illustrious visitor. The meeting of the Sovereigns was of the most affectionate character, without any formal or ceremonial greetings, but showing in the strongest manner the existence of those reciprocal kindly relations which are such a source of true gratification to monarchs as well as to subjects. His Majesty clasped the Queen in his arms, kissing her with the utmost affection, both being evidently much affected. The King then led Her Majesty towards the grand staircase, where he met the Duchess of Kent, who was accompanied by the Countess of Gainsborough and the ladies of the Queen's suite. Awaiting the arrival of the King were the Duke of Wellington, the Earl of Aberdeen, the Earl of Delawarr, the Earl of Liverpool, and Sir Robert Peel. His Majesty recognised Sir Robert Peel and the Earl of Liverpool, and cordially bowing to them, proceeded up the grand staircase to his apartments, accompanied by the Queen and Prince Albert, and followed by the Duc de Montpensier and the Duchess of Kent. At the entrance to the crimson drawing-room Her Majesty parted from the King, who proceeded to his private apartments, attended only by his personal attendants, where he remained for a short time. In about a quarter of an hour he again met Her Majesty at lunch, which was strictly a private party, being confined to the Queen, the King of the French, Prince Albert, the Duchess of Kent, and the members of the royal suites. His Majesty appeared to be in excellent health, and in the best possible spirits, evidently very much pleased with a reception which was well calculated to afford him pride and satisfaction. In a very short period after the arrival of His Majesty, the greater number of the numerous visitors who had arrived in Windsor had all departed, it being understood that none of the royal party would appear in public at any subsequent period of the day. Dinner was served at seven o'clock in the dining-room. The table was tastefully decorated with epergnes of silver gilt filled with artificial flowers, with vases and other ornaments, and was lighted by gold candelabra. George the Fourth's magnificent wine-cooler was placed in the centre window of the apartment. The company included His Majesty Louis-Philippe, the Duchess of Kent, the Duc de Montpensier, Lady C. Dundas, the Countess Wratislaw, the Count and Countess de St. Aulaire, the Duke of Wellington, the Marquis of Exeter, the Earls of Liverpool, Delawarr, Jersey, and Aberdeen, Sir R. Peel, Mons. Guizot, Admiral de Mackau, Count de Jarnac, General Athalin, and the other members of the suite.—On Wednesday morning the Queen, with her illustrious visitors, promenaded in the private grounds around the Castle. In the afternoon, Her Majesty, resting on the arm of the King of the French, and accompanied by Prince Albert, with the Great Officers of State and several members of the Royal suite, left the Castle and proceeded to St. George's Chapel. The royal party were received by the Dean and Canons in residence, who accompanied the illustrious visitors through the various portions of the edifice, visiting in turns the choir, the chapels, and the chapter-room, and subsequently inspecting the Princess Charlotte's cenotaph. His Majesty appeared greatly pleased with his visit to the chapel, remarking to the Dean that he had many times previously derived much gratification from inspecting its varied treasures of art and antiquity. The beautiful stained glass windows, recently put in by Mr. Willement, were greatly admired by His Majesty. After viewing St. George's Chapel, the royal party entered Cardinal Wolsey's Chapel, and afterwards walked down the Home Park to the dairy. They next paid a visit to the royal aviary, where His Majesty examined the interesting collection. The weather becoming unpropitious, the Queen and Prince Albert, and the King of the French, with their suites, entered a pony carriage and four, and drove to Frogmore Lodge, on a visit to the Duchess of Kent. The royal party remained near an hour with the Duchess, and then returned to the Castle. After alighting at the grand entrance, His Majesty Louis-Philippe, the Queen and Prince Albert, inspected some of the principal domestic offices of the Castle on the ground floor, passing through the confectionary room, the kitchen, and the gilt room, the Lord Steward attending them. Their Majesties and the Prince afterwards returned to the state apartments, and in the evening a grand dinner was given in St. George's Hall, when the splendid collection of gold plate in the royal treasury, which is so celebrated for its workmanship, antiquity, or historical interest, was displayed for the occasion. The Queen was seated at the north side of the table, between his Majesty Louis-Philippe and the Duc de Montpensier; opposite was seated Prince Albert, between the Countess St. Aulaire and Lady Charlotte Dundas. M. Guizot, the Earl of Aberdeen, Count de St. Aulaire, the Countess of Gainsborough, and the Duke of Wellington, had also seats in the vicinity of the royal circle. The Duchess of Kent sat by the side of the King of the French, and among the other guests were the Lord Chancellor, Sir Robert Peel, Sir James Graham, Lord Wharncliffe, and other Ministers. The Duke de Montpensier, accompanied by Count Jarnac and Colonel Thierry, Aide-de-Camp to his Royal Highness, left the Castle in the morning in one of the royal carriages-and-four for the Slough station of the Great Western Railway, proceeding thence to town, where his Royal Highness visited several of the more important national edifices, and after lunching at the embassy, returned to Slough by the five o'clock train, where one of the Queen's carriages was in waiting to convey him to the Castle. On Thursday morning the royal party left the Castle in the *char-à-banc* presented to the Queen by the King of the French as a memorial of Her Majesty's visit to the Château d'Eu. The Queen occupied the front seat, the King of the French taking his position upon Her Majesty's left hand. The Duc de Montpensier and the Duchess of Kent occupied the next seat. Prince Albert and the Countess of Gainsborough occupied the third seat, the fourth being filled by General Athalin and Count Dumas. Lord C. Wellesley, Equerry, and Colonel Bouverie accompanied the royal party on horseback. The *char-à-banc* affords no accommodation for servants, and therefore the royal party were not accompanied by any attendants—two out riders in state liveries alone preceding the carriage. On passing through the lodge gates the royal party were loudly cheered by the crowd assembled. The route taken was by Frogmore, Egham, and Staines, to Sunbury-common, where relays of horses having been procured, the royal party proceeded to Twickenham, and visited the former residence of His Majesty, now in the occupation of the Earl of Mornington. From Twickenham the illustrious party proceeded through Bushy Park to Hampton Court, where they inspected the great hall, banqueting-room, and state apartments, and then proceeded to the gardens, melon grounds, and forcing houses, where a principal portion of the fruit consumed at Her Majesty's table is produced. The celebrated vine, which is now loaded with fruit, was subsequently visited by the royal party. On leaving Hampton Court, their Majesties proceeded to Claremont, where they partook of luncheon, and afterwards inspected the house and grounds. The royal party returned to Windsor Castle by Chertsey, where the horses were again changed, and, having set down the Duchess of Kent at Frogmore House, arrived at the Castle about 20 minutes before 6. The return of the royal party to the Castle had been anxiously expected by an immense crowd of persons, congregated near the lodge-gates, and along the Frogmore-road, for some time before their arrival, the road being lined with carriages and horsemen for a considerable distance. During the interval before the arrival of the royal party the Duke of Wellington rode through the throng. His Grace was very loudly cheered, and acknowledged the compliment with his well-known Military salute. Nothing could exceed the enthusiasm of the assembled spectators when the royal party were observed approaching in the *char-à-banc*. As the carriage passed through the crowd a spirit-stirring cheer arose in which all present took part. The King of the French was evidently much affected at the warmth of the reception which greeted him on every side, and both His Majesty and the Queen bowed to the spectators. On alighting at the Castle the royal party were received by their Royal Highnesses the Duke of Cambridge and the Hereditary Grand Duke of Mecklenburg Strelitz, who had arrived a short time pre-

vious, and also by the noblemen and gentlemen of the household in waiting. Dinner was served at seven o'clock in St. George's Hall. The royal banquet presented a display of magnificence and splendour equal to that of the preceding evening. Covers were laid for 80 persons, and the table was ornamented with the splendid service of gold plate. In front of the west sideboard was placed the head and front paws of the royal tiger couchant, which formerly supported the canopy of the throne of the Sultan of Mysore. The eyes, tusks, and the claws of the figure are of rock crystal; the rest of the head and paws are covered with plates of pure gold. The state standards of Tippoo Sultan, also captured at the storming of Seringapatam, were placed over the tiger's head, and on each side were candelabra filled with wax lights, ornamented with oriental figures and emblems. The Queen sat on the north side of the table in the middle, having His Majesty Louis-Philippe on one side, and the Duc de Montpensier on the other.—Yesterday the Queen held a Chapter of the Order of the Garter, at which his Majesty was invested as a Knight of that ancient Order. It is said that the Queen and Prince Albert will accompany Louis-Philippe on his return to Portsmouth, and convoy His Majesty in the royal yacht, to within a short distance of the opposite coast.

The French Squadron.—Independently of the magnificent reception given to the King by the authorities and inhabitants of Portsmouth, great preparations have been made to do honour to the officers of the French squadron. On Tuesday Vice-Admiral La Susse and the other officers of the squadron dined at the Commander-in-Chief's, Admiral Sir C. Rowley, but we regret to hear that the health of the gallant admiral was such as to have prevented his going on board to receive His Majesty, on his arrival, or to do the honours of his table at dinner. On Wednesday the French officers were entertained by the general in command of the garrison, Major-Gen. Sir H. Pakenham, and a numerous party was invited to meet them. On Thursday morning a distinguished party went on board the Gomer, at the invitation of Admiral La Susse and Captain Goubens. The party consisted of General and Lady Pakenham, Sir Francis and Lady Stapleton, Lady Louisa Noel, and most of the individuals who were present at the dinner of the previous evening. After having been shown over this magnificent vessel by the officers on board, the party was invited to partake of an elegant *déjeúner* in the Admiral's cabin. The band of the ship played during the time the company remained on board. In the course of the morning the French war steamer Elan came into harbour from Tréport, which she left on Wednesday evening, with despatches for the King from Her Majesty the Queen of the French. This was the vessel that was despatched by His Majesty immediately after his arrival on Tuesday with letters to the Queen. It appears that they were to announce his having reached the shores of England in safety, and the enthusiastic reception he had met with from the British people. The accounts brought by the Elan state that nothing could equal the delight of the Queen upon perusing His Majesty's letters, and that she expressed her gratification in the most unmeasured terms at the flattering manner in which His Majesty had been received. The despatches brought by the Elan were immediately forwarded to His Majesty at Windsor. In the evening, Admiral Sir C. Rowley gave a splendid banquet at the Admiralty House to the French officers and a distinguished party; and after dinner, the Admiral gave a ball, at which all the principal Authorities of the port and garrison were present. Yesterday the French Officers were to dine with Admiral Superintendent Parker, and afterwards attend a grand ball and supper given by the English Naval and Military Officers in the Naval College, to which 1300 persons are invited. This evening the Mayor, Corporation, and inhabitants of Portsmouth will entertain the French Admiral and his Officers at a splendid banquet, at which 240 persons are expected to be present.

The Peerage.—The *Gazette* of Friday contained the official announcement that Her Majesty has been pleased to call Lord Stanley to the House of Peers by writ of summons, under the title of Baron Stanley, of Bickerstaffe.—It is rumoured that Her Majesty is about to raise Earl Delawarr to the first rank in the peerage by reviving in his person the extinct Dukedom of Dorset, the Countess being, with the exception of Countess Amhurst, the only surviving representative of that Dukedom.

Order of the Garter.—The blue riband placed at the disposal of the Premier by the recent death of the Duke of Grafton occasions the eighth vacancy that has occurred in the list of Knights of the Garter since the accession of the present Ministry to office. Few similar instances of so large an amount of patronage falling into the hands of the First Minister of the Crown within so short a period of time are to be met with in the annals of the Order. The first of these vacancies occurred in 1841 by the death of the Earl of Westmoreland, then Senior Knight of the Order, which was followed in the ensuing year by that of the Duke of Cleveland, the Marquis of Hertford, and of the Duke of Norfolk. In April 1842, the Duke of Beaufort, the Duke of Buckingham, the Marquis of Salisbury, and the Duke of Cleveland were elected into the Order and invested at Buckingham Palace. Four vacancies have since been created by the decease of the Marquis Wellesley, the Duke of Dorset, the Earl of Lonsdale, and the Duke of Grafton. Three of these ribands will it is understood be conferred on the late Lord-Lieutenant of Ireland, Earl de Grey, the Marquis of Abercorn, and Earl Talbot. The fourth still remains at the disposal of the Premier. Within the same period of time three vacancies have been created in the Order of the Thistle, by the decease of the Earl of Abergavenny, senior Knight of the Order, followed by that of His Royal Highness the Duke of Sussex and of Earl Cathcart. Two of the green ribands have been conferred on the Marquis of Bute and the Earl of Mansfield, who were invested at a chapter of the Order held at Buckingham Palace in 1843, and the third remaining at the disposal of the Premier will, it is understood, shortly be conferred on the Duke of Montrose. The investiture of the King of the French with the insignia of the Garter took place last night at Windsor Castle. The present King is the eighth monarch of that country who has received this distinguished order, it having been held at various times by Francis I., Henry II., Charles IX., Henry III., Henry IV., Louis XVIII., and Charles X. The following reigning Sovereigns and foreign Princes are among the existing Knights of the Order:—The Emperor of Russia, the King of Prussia, the King of Hanover, the King of the Belgians, the King of Saxony, the King of Wurtemburg, the reigning Duke of Saxe Meiningen, and the Prince of Leiningen. The last investiture of a reigning Sovereign at Windsor took place on the occasion of the King of Prussia's visit to this country in January, 1842, when His Majesty was elected a Knight Companion, in virtue of his lineal descent from George I.

The Church.—Her Majesty has been pleased to confer upon the Rev. Dr. Wordsworth, head master of Harrow School, the prebendal stall in Westminster, vacant by the death of Archdeacon Bayley. Two other prebends in Westminster Abbey are vacant, but, according to the regulations of the ecclesiastical commission, are not to be filled up. An annual residence of three months being required, Dr. Wordsworth resigns his present post, which therefore becomes vacant at the end of the present year.

Death of the Marquis of Donegal.—The noble marquis expired on Saturday last, at Ormeau, near Belfast, after a protracted illness. His lordship, George Augustus Chichester, Marquis of Donegal, Viscount of Chichester, Baron Belfast and Viscount Fisherwick, in England, lieutenant of the county Donegal, Knight of St. Patrick, &c., was born in 1769, and was consequently in his 76th year. He is succeeded in his title and estates by his eldest son, the Earl of Belfast, lord lieutenant of the county of Antrim.

The Revenue.—The Revenue returns for the year and quarter ending on the 10th inst. were published yesterday. The total Revenue of the *year* is 50,741,622*l.*, being an increase on the previous year of 1,395,349*l.* In the Customs there is an increase of 1,723,165*l.*; Excise, 173,898*l.*; Stamps, 69,129*l.*; Property Tax, 106,413*l.*; Post Office, 82,000*l.*; Crown Lands, 7500*l.*, to which must be added Repayments of Advances, 228,159*l.*; making a total increase of 2,390,264*l.* In the Taxes there is a decrease of 2937*l.*; Miscellaneous, 948,004*l.*, to which must be added, Imprest and other Moneys, 43,974*l.*, making a total decrease of 994,915*l.*, which being deducted from the increase of 2,390,264*l.*, gives as above an increase on the year of 1,395,349*l.* The total Revenue of the *Quarter* is 14,372,353*l.*, being an increase on the corresponding quarter of last year, of 520,944*l.* There is an increase in the Customs of 473,347*l.*; Stamps, 15,322*l.*; Taxes, 7339*l.*; Post Office, 40,000*l.*; Miscellaneous, 203,217*l.*, making a total of 739,225*l.* There is a decrease in Excise of 5660*l.*; Property Tax, 89,193*l.*; Crown Lands, 10,000*l.*; to which must be added Imprest and other Moneys, 6188*l.*; Repayments of Advances, 107,240*l.*, making a total of 218,281*l.*, which being deducted from the increase of 739,225*l.*, gives as above, an Increase on the Quarter of 520,944*l.*

Foreign.

FRANCE.—The King's visit to England appears to be a subject of comment and of attack on the part of the Opposition papers, almost as virulent as the Morocco war, or the dethronement of Queen Pomaré. The *National* cannot see in His Majesty's visit a mere personal compliment from the sovereign of one great nation to the sovereign of another. It declares that the policy of the Ministry was for some time past wholly influenced by the desire of seeing this visit accomplished, and that the brilliant hospitality prepared for Louis-Philippe has been paid for in advance "by those disgraceful concessions which have been the policy of M. Guizot for the last four years, and that the King may be well received by the English aristocracy, since he carries in one hand the indemnity to Pritchard, and in the other the treaty of peace with Morocco." Even the official part which falls to the lot of the Duke of Wellington to perform, as Warden of the Cinque Ports, in the reception of His Majesty, is looked upon as an insult to the whole French nation, which can never hear the name of Wellington without bitter recollections. The announcement, too, that the brevet in the army is to be postponed in honour of Louis-Philippe is looked upon as a still further insult, because some of the officers to be promoted might have been present at Waterloo. The *Débats*, however, replying to the articles of the Opposition on the visit of the King to England, has the following gratifying article:—

"England is preparing to give the King of the French a reception worthy of herself and of him. The nation shares in the sentiments of its Sovereign, and prepares *fêtes* for the officers of the French navy, as the Court does for the King. We should have thought that in these spontaneous manifestations, there would be seen testimonies of goodwill and sincere cordiality. It appears that we were very credulous, and that England is very perfidious. We should have thought that it was intended to do honour to our country, but it appears the object is only to insult it. It is France that has been sacrificed for the King's journey; it is again France that will be insulted during the King's stay in an allied country. What, then, is this great affront which England again destines for us? She sends the Duke of Wellington to meet the King. That is an insult to France—an insult to the Revolution of July. This is, in fact, manifesting a strange idea of the dignity of one's country. Assuredly, we cannot efface history. We cannot prevent this name from being mixed up with events the most painful, and at the same time the most glorious of our annals; but is France then so weak and so petty that she cannot look those men in the face whom she has met at other times in the battle-field? When the first lieutenant of the Emperor went to attend the coronation of Queen Victoria, did England look on his presence as an insult? Did she attribute as a crime to the veteran the wars of the Empire, the reminiscences connected with his name and his reputation? Has there nothing passed for the last thirty years? And the great event which restored us to the first rank of free nations, which raised us up again in the eyes of Europe—the Revolution of July—is that nothing? England sends her most illustrious citizens to meet the King, and it is an insult forsooth to the Revolution of 1830! We say that it is an honour. It is precisely because England sees represented by the King, or rather sees in the King the country over which he reigns, and the revolution from which he sprung, that the reception which she gives to him honours the nation which he represents. The men who are at this moment about to receive the King of the French, are those who the first recognised and adopted with enthusiasm the Revolution of July. The Ministers who at present govern England are the very same that held the direction of public affairs in 1830, and who, in the midst of the alarm and doubt of the rest of Europe, hailed without hesitation the triumph of liberal and constitutional principles in our country. We perceive what are the tactics of the Opposition journals; it was easy to foresee them. They want to separate the King from the nation; they wish to turn the honours which will be done to him into so many insults to France. The country will not be thus led astray: it will be proud of the testimonies of respect and admiration of which its august representative will be the object, in the midst of a people so long free; it will take its share of them, and behold in the reception made to the King of 1830, a striking and sympathetic homage rendered to its revolution."

At a council of Ministers, at which the King presided on the Wednesday preceding his departure, an ordinance was passed conferring upon the Duc de Nemours all the powers of royalty during His Majesty's absence, and appointing him Lieutenant-General of the Kingdom. These functions are not to be exercised but in a case of extreme necessity, which it is to be hoped will not occur, and the act is a mere measure of precaution. The Opposition papers already attack this delegation of the Royal authority, even temporarily, to the Duc de Nemours, and declare that the object of the Ministry is to augment the claims of the future regent to a dotation. The creation of Peers, which has been expected for some time, has been postponed till after the King's return from Windsor. The last time Louis-Philippe visited England was in 1815, during the hundred days. When Louis XVIII. went to Ghent, the Duc d'Orleans took refuge in England, where he remained until the Battle of Waterloo enabled him once more to return to the Palais Royal. Louis-Philippe entered the 71st year of his age on Saturday, having been born on the 6th October, 1773. By a Royal ordinance, dated at the Château d'Eu, the 4th October, the King has been pleased to pardon all political prisoners whose sentences were pronounced previous to the year 1844, and the term of whose punishment would expire before the 1st January, 1847; and also to twelve political prisoners condemned to 6, 10, 15, and 20 years' imprisonment or deportation. The *Journal des Débats*, in announcing this act of clemency, says it was adopted by His Majesty in commemoration of the recent events in Morocco. M. Dupotet, the editor of the *Journal des People*, is among the number of those who will thus recover their liberty. M. Dupotet was condemned in the month of December, 1841, by the Court of Peers, to imprisonment for five years for the crime of "moral complicity" in the affair of Quenisset, who, it may be recollected, fired a pistol at the late Duc d'Orleans. The amnesty to the political convicts is generally received as a boon, but it is generally regretted that it does not go further. It, however, gives liberty to nearly 60 prisoners.—The *Journal des Débats* publishes a letter from Valparaiso, dated the 1st June last, containing, it was believed, the official account of an engagement between the French and Tahitians on the 18th April. "The Tahitians," it says, "assembled at a distance of 12 miles from the town occupied by our troops, and threw up intrenchments, defended by 7 guns, and by the bravest part of the population. 500 Frenchmen landed opposite the works, which withstood during three hours the most obstinate assault. At last the marines, exasperated by the fall of 50 of their number, of two officers killed, and two midshipmen left for dead on the field, made a desperate charge [illegible] bayonet and carried the redoubts. The dead b[illegible] 170 Tahitians and two English deserters, who ha[illegible] them, were found in the works. The natives l[illegible] persed, and were greatly discouraged by so con[illegible] defeat. We lost 52 wounded, and 25 killed. T[illegible] officers were shot dead. One of the midshipm[illegible] wounded in the arm, and the other had his thigh [illegible] and received two bullets through the arm and b[illegible] Other accounts received direct from Tahiti state t[illegible] the 4th April, another affair occurred which might [illegible] led to a rupture with this country. Lieut. Ro[illegible] H.M.S. Hazard, was intercepted on his return fro[illegible] shore to his own ship, after landing despatches, and [illegible] pelled by force to go on board the French frigate [illegible] lying in the harbour. Having but four men in his [illegible] beside the assistant-surgeon of the Hazard and him[illegible] without any arms but his own sword, he considere[illegible] would be impossible to resist effectually such oppo[illegible] force, and after protesting against this insult to an [illegible] cer of the British navy in uniform, with the British p[illegible] dant flying at the boat's masthead, he ordered the penn[illegible] to be hauled down, and then surrendered his sword [illegible] the French officer, and was immediately conveyed on board a French frigate, where he was detained as a prisoner for three hours, and then liberated, the French Admiral afterwards sending an apology to Commander

Bell, of the Hazard, for the interruption. Lieut. Rose, by permission of his Commander, has come to England to lay the affair before the Admiralty.—The Duke of Glucksberg left Paris on Saturday for Madrid, from which place he will proceed immediately to Morocco. He is the bearer of the treaty of peace between France and Morocco, ratified by the French Government. As a recompense for his services in the Morocco affair, the King has appointed the Duke of Glucksberg an officer of the Legion of Honour.—The Opposition papers declare that Marshal Bugeaud has declared himself greatly dissatisfied with the terms upon which peace has been concluded with Morocco, and that the same feeling is prevalent throughout the army. The *Revue de Paris* says that the Ministry has serious intentions of raising the French possessions in Algiers, and to appoint the Duc d'Aumale Viceroy, with very extensive powers. The Emperor of Morocco had accepted the mediation of France for the adjustment of his differences with Denmark and Sweden, and it was believed that he would renounce the tribute paid to him by those two Powers in virtue of ancient treaties.—The adjudication of the Orleans and Bordeaux and Orleans and Vierzon railroads took place at Paris on Wednesday, when the Minister of Public Works proceeded to open the sealed tenders. which had been deposited by three companies, represented by Messrs. Rothschild, Drouillard, and Mackenzie. The maximum of the assignment was fixed at 41 years. Messrs. Mackenzie, Paterson, and Co. offered to take it for 28 years all but 17 days; Baron Rothschild, for 31 years and 9 days; and M. Drouillard, for 36 years and one day. Messrs. Mackenzie and Co., being the lowest bidders, were declared the recipients. The Orleans and Vierzon railroad was subsequently adjudicated to M. Bartholony, the representative of the Orleans Company, for 39 years and 11 months, the masimum fixed by the Minister being 40 years. The two companies bidding for that road had previously coalesced. The Orleans Company was to have 3-5ths, and the other the remainder. The shares of the Mackenzie Company, which opened at 60*f.* pm., closed at 100*f.*

Spain.—Our accounts from Madrid are of the 30th ult. It was believed that the Marquis de Miraflores would be appointed President of the Senate. A deputation of the province of Guipuzcoa had waited upon the Queen, to thank Her Majesty for restoring the old and liberal institutions of the Basque Provinces; "a model," said Don Pedro Egana, its president, "of the wisdom of the times long gone by, and a monument of government and administration which might serve as a lesson to modern times." The Queen promised her protection to the Basque people, and Maria Christina, to whom M. Egana also addressed a speech, replied, that nothing was more grateful to her than the title of mother of those noble provinces, which he had bestowed on her. General Narvaez was still pursuing his system of reform and economy. He intended to suppress all the military inspections, a measure which would save a considerable expense. Preparations were making for the opening of the session, to which it was intended to give the greatest *éclat*. The drawing up of the speech from the throne was to be intrusted to M. Martinez de la Rosa.

Portugal.—We have Lisbon news to the 1st inst. The Cortes met on the previous day, and incidental questions of confidence in Senhor Cabral's Government had been raised in both Chambers, and carried by considerable majorities in his favour. The majority in the Deputies was numerically the same as in the previous session. The tobacco, soap, and gunpowder contracts had been let most advantageously for 1521 contos, with the condition annexed of a loan of 1,000,000 sterling to Government, at 5 per cent. and at par, to be redeemed within 23 years. The local capitalists were full of confidence in the Government, and its position had not been firmer at any previous period. The *Railway Chronicle* states that a proposal has been submitted to the Government of Portugal for the construction of a line of railway from Lisbon to Oporto, through Santarem and Coimbra. The project has been warmly taken up by many influential capitalists at Lisbon, as also by parties connected with Portugal in this country. The necessary capital is to be raised half in

[illegible] that the vessel will be again [illegible] for ex[illegible], and that should not be a binding to the amount of the estimate fixed by the Government surveyors, she will be bro[illegible] up, and [illegible] of gun-b[illegible]

[illegible] with his cane the wife of a toll-keeper on the bridge over the Rhine, who refused to let him pass without paying toll. The Prince's family have since offered the woman a considerable sum of money to withdraw her complaint, but she persists in her intention to bring the matter before the Court.—The city of Treves for several weeks past has been the scene of an extraordinary pilgrimage from all parts of Catholic Europe, in honour of a relic supposed to be the gown worn by our Saviour. The exhibition of this relic commenced on the 25th August, and since that time no less than 800,000 pilgrims have visited Treves.—It appears by a letter from Vienna, of the 20th ult., that the Emperor of Austria has positively ordered the suppression of lotteries in his states from the 1st January next. The persons who keep the lottery-offices, and whose appointments were all for life, are to receive a small pension and a sum of money out of the profits of the lotteries for the present year.—A letter from Leipzig of the 29th contains the following paragraph:—"I must acquaint you with an affair which causes a great sensation here, because ill-disposed journals may very likely spread all sorts of false statements respecting it. His Majesty the King of Saxony, before his journey to England, made purchase of a Jewish jeweller to the amount of 30,000 dollars for presents. On distributing them it appeared that most of the stones were false, for which reason the return of all the presents is requested."

Italy.—Letters from Naples of the 27th, mention that the political prisoners who have been imprisoned in the Castle of St. Elmo for the last six months on suspicion of being implicated in the insurrection in Calabria have been set at liberty. It is said that the Government did not bring them to trial, as they were afraid of an acquittal. Great preparations are making in Naples for the marriage of the Duc d'Aumale with the Princess of Salerno, which is expected to take place about the beginning of November.—It is believed that the report circulated by the German papers of a contemplated Italian customs union is untrue, or at best premature. At the scientific meeting the question was the theme of conversation, but without the slightest intention of carrying the principle practically into effect.—The Papal Government has rejected the proposition of an English Company to construct a railroad between Civita Vecchia and Rome. It is only of late years that a diligence has been allowed to ply in the Papal States; a railroad, therefore, would seem to be a step in advance reserved for another age.—The King of the French has, through his Ambassador at the Court of the Holy See, caused a liberal donation to be presented to the commissioners constituted at Rome for the purpose of erecting a monument in memory of Tasso.

Greece.—Our accounts from Athens are of the 19th, on which day the session of the Chambers was opened by the King in person. His Majesty's speech contains nothing to call for particular notice. No public business was entered into after the delivery of the King's speech, so that the feeling of the Chamber in respect to the new ministry was not yet known. The first anniversary of the revolution of the 15th September was celebrated as a national *fête*. The King and Queen attended a solemn thanksgiving in the principal church, the whole of the troops were under arms, and in the evening the city was illuminated. A subscription dinner was given to Colletti and Metaxa, at which according to the Ministerial papers they were enthusiastically received. Between 300 and 400 persons were present, and among them a great number of deputies, senators, and all the principal functionaries.

Turkey and Egypt.—From Constantinople we learn that the question of the Government of the Lebanon has been at length settled, and the indemnity to be paid by the Druses to the Maronites has been definitively arranged. The indemnity has been fixed at 13,000 purses, of which the Druses are to pay 3000, and the Porte the rest. The Government will remain as settled by the Porte and the five European Powers in 1842, and the Maronite Christians are to be protected in future. The country is in a state of the greatest tranquillity.—The revolt of the political convicts in the salt mines of Wallachia, in consequence of the harsh conduct of Prince Bibesco, and the consequent sacrifice of life, an account of which had previously reached us through the German papers, is confirmed by these accounts from Constantinople.—From Alexandria we learn that the disappearance of a young Christian had revived the complaints against the Jews which were, some years back, brought against their brethren of Damascus, and they were charged with having killed him in order that his blood might be spread over their unleavened bread. The Pacha, however, would not listen to the story, and ordered the young man to be sought for and found. After some delay he was discovered in a Greek convent in Upper Egypt, where of course the Jews could have had no interest.

Parliament.

HOUSE OF LORDS.

Thursday.—This being the day to which Parliament was prorogued, both Houses met for the purpose of further proroguing them till December. Shortly after one o'clock the Lord Chancellor, Lord Wharncliffe, and the Earl of Dalhousie, dressed as Lords Commissioners, took their seats below the Throne, and Mr. Pulman, Deputy Usher of the Black Rod, was ordered by their lordships to summon the House of Commons, to hear Her Majesty's Commission for the further prorogation of Parliament read. Mr. Pulman then retired from the House to summon the Commons, and in a few minutes Mr. Ley, the junior table clerk, together with several other officers of the House of Commons, appeared at the bar. The commission for the further prorogation of Parliament was then read by the clerk at the table, at the conclusion of which the Lord Chancellor, in the name of Her Majesty, declared the Parliament prorogued to Thursday, the 12th December. The whole proceeding did not occupy their lordships 10 minutes.

CITY.

Money Market, Friday.—Consols for account closed at 100¾; Red. Three per Cents., 99⅞ to 100; New Three and a quarter, 102¾; Bank Stock, 206½; India Stock, 288; Exchequer Bills, 75 to 77 pm.

GAZETTE OF THE WEEK—BANKRUPTS—A. Pellissier, Bentinck-terrace, Regent's Park, lodginghouse-keeper—F. H. West, High-street, Shoreditch, victualler—N. Wandsbrochi, Blackheath-hill, boardinghouse-keeper—E. Mismaiden, Liverpool, wine dealer—N. Roberts, Liverpool, merchant—J. J. Barz, Chester, tailor—J. Prior and H. Brady, Kingston upon Hull, brush manufacturers—J. Tristram, Two Mile Houses, Nottingham, beerhouse-keeper—T. W. Butterworth, Hulme, Lancashire, draper—S. A. Fiebriham, Hartlepool, Durham, grocer—A. Arbuthnot, East Malling, Kent, baker—D. Priestley, Great Distaff lane, warehouseman—J. Dansaster, Brighton, painter—J. F. Cork and J. L. De Carle, New Bond-street, coach builders—H. Rowe, Charles-street, Hatton Garden, merchant—C. James, Grand Junction-terrace, Edgware-road, oilman—A. Warren, Parliament-street, confectioner—T. G. Martin, Cold Harbour-lane, Camberwell, wine merchant—J. Coulson, Great Clacton, Essex, innkeeper—C. Penson, Cheltenham, dressmaker—J. Whitehead, Bolton-le Moors, Lancashire, common brewer.

SCOTCH SEQUESTRATIONS.—J. Scott, Perth, ironmonger—J. Colston, Greenock, physician—T. Sinclair and Co., Eskside, Musselburgh, hair manufacturers—Tait and Co., Leith, fleshers—R. Tulloh, Fort George, merchant—A. Rennie, Inverness, solicitor.

Metropolis and its Vicinity.

Court of Aldermen.—On Wednesday a Court was held at which Mr. Sheriff Sidney was sworn in as alderman of Billingsgate-ward. It was expected that Mr. Salomons would have appeared to be sworn in as alderman of Portsoken-ward, but the Lord Mayor explained that he had agreed to postpone his appearance, as it would have been inconvenient for Mr. Salomons to attend on that day; Tuesday next was therefore appointed for the purpose. It was then resolved that an address of welcome and congratulation be presented to the King of the French on his arrival in this country.—On Thursday the Court of Common Council adopted an address to His Majesty, which was, with the exception of one paragraph, precisely similar to that adopted by the Court of Aldermen. The two Courts being thus completely united in sentiment on the subject, will go up together with a joint address.

Murder of an Englishman at Calais.—Accounts have been received from Calais, stating that a sad event which occurred at an early hour on Sunday morning has thrown that town into a state of excitement. The Commissaire of Police for Passports, M. Salior, had been drinking on Saturday night with a Mr. Thorne, an English surgeon, at which time they were apparently on very friendly terms; when, about 1, A.M., they went to the Commissaire's office together, for what reason is not known, when a dispute arose, and the Commissaire stabbed the other to the heart with a poignard, which was discovered in the office. Mr. Thorne fell on the floor, and died instantly. He was a quiet man, who has resided at Calais several years, and has left a widow and several children. There is a report that M. Salior owed Mr. Thorne money lost at cards. M. Salior spoke English remarkably well, and had formerly been an actor. He was given into the custody of the gens d'armes, who detained him at his own house till the arrival of the Procureur du Roi from Boulogne.

The Royal Exchange.—It is generally supposed that the 23d inst. will be the day on which Her Majesty will visit the City, on the occasion of opening the Royal Exchange. On the arrival of Her Majesty and Prince Albert at Temple-bar, attended by the great officers of state, the Lord Mayor and the different civic authorities will be in waiting to meet the royal *cortège*, and precede the Queen and royal party along Fleet-street, up Ludgate-hill, through St. Paul's Churchyard, and by Cheapside to the western entrance of the Royal Exchange, where a temporary carriage way is in formation, to admit Her Majesty to alight at the steps of the portico. On the Queen descending from the Royal carriage the chairmen and members of the Gresham and Corporation Committees are to receive Her Majesty. It is not yet known whether Her Majesty will walk round the merchants' area, or proceed direct to the subscription-room of Lloyd's, where the banquet is to take place. The committee have decided on an entertainment in the merchant's area, where the number to be accommodated is stated to be 1800. The regiment of Royal Horse Guards, it is said, are to keep the carriage way along the route, and, after a certain hour of the day, no public vehicle or carriage will be permitted to pass through the leading thoroughfares of the city, except those of the state officers and nobility invited to be present at the ceremony.

Westminster Improvements.—A meeting of the inhabitants was held last week to consider certain defects in the new plans for the Westminster improvements. The following are some of the defective points which it was agreed to lay before the Commissioners of Woods and Forests:—1st. By "Rigby Wason's altered line," Westminster Abbey, which ought to be thrown open to public view, is left equally as obscure as now. 2d. Instead of a direct line to Pimlico, from Westminster Abbey, it is a curved street from Westminster Abbey to Vauxhall-bridge-road. 3d. It does not improve the approaches to the palace, but diverges farther and farther from it every yard it proceeds. 4th. It leaves the sewerage of Westminster unimproved, and does not touch the bad lanes, courts, and alleys branching out of York-street, in the neighbourhood of the palace, which are a constant source of malaria, and consequent fever. There were other points of objection, but the foregoing were considered such radical defects, that it was thought it would only be needful to call the attention of all parties to them, to insure its rejection. A subscription was entered into, and a committee formed to take the necessary steps.

The Mysterious Case at Stepney.—On Monday, for the third time, the inquest was resumed on the body of Samuel Cornish, late steward of the royal mail steam-packet Dee, who was poisoned with arsenic. The particulars of the case were given in our last. As the effect

of the evidence appeared to implicate a female named Sutherland, she was taken into custody on suspicion of having administered the poison, and the following day was conveyed to the Thames Police-court, where she was discharged for want of evidence. Mr. Pelham, the solicitor, attended on the part of Mrs. Sutherland, who was in the neighbourhood during the investigation. After some additional evidence not very creditable to Mrs. Sutherland or her witnesses, the Coroner summed up, observing that the case was involved in considerable mystery. There was no evidence before them to implicate any one. The jury would have to consider whether the death of the deceased was caused by arsenic, and, if they were so satisfied, the next point for their consideration was, whether it had been administered with a criminal intention. The deceased had frequent opportunities of expressing his suspicions, but even at his last moments he made no charge against any one. The jury, after consulting together for about half an hour, returned the following verdict:—"Wilful murder, by arsenic, against some person or persons unknown, and strong suspicions attached to Mrs. Sutherland." Mr. Pelham objected to the latter part, which was at his instance omitted.

Repeal of the Malt-tax.—A new agricultural movement has commenced, the object of which is the repeal of the malt-tax. A meeting of several influential agriculturists took place a few days since at the York Hotel, Blackfriars. Mr. James Ellis, of Kent, in the chair. Mr. Baker, of Writtle, well known as the leader of the late Agricultural Protection movement, was also present. It was agreed on all hands that the malt-tax was an oppressive imposition, particularly on the working classes, and that its repeal at the present time would call into activity a large amount of agricultural labour now unemployed. Resolutions were accordingly passed to take the requisite steps to procure the abolition of the duty in the ensuing session of Parliament.

Royal Pardon.—On Saturday Her Majesty's pardon was received at Newgate by the Governor for the discharge of Capt. Petrie, who was tried at the February sessions of the Central Criminal Court, before Mr. Justice Coleridge, for the manslaughter of one of his crew during a mutiny on board his ship, and sentenced to 18 months' imprisonment.

"Evenings of a Working Man."—A few months since, a small volume of tales and poems under this title, written by a poor working man named John Overs, as the occupation of his scanty leisure, was published with a very earnest and affecting preface by Mr. Dickens. The book, and the interest expressed by Mr. Dickens, originated in the anxiety of a clever and deserving man in humble life, afflicted with a mortal sickness, to make some temporary provision, however slight, "for his sick wife and very young family." We do not know what success it has had, or whether the arrangement with the publisher was such as to give Mr. Overs the full benefit of it; but the poor man died suddenly on Saturday, at 55, Vauxhall-street, Lambeth, leaving, all but destitute, a widow and six children, the oldest nine years and the youngest two months old. A subscription has been opened for their benefit, and it is hoped that it will be attended with success.

Mrs. Nisbett.—It is said that the gentleman of high rank in the Customs, to whom this accomplished actress has been recently united, and in consequence of which she has left the stage, is Sir William Boothby, Bart., Receiver-General of Her Majesty's Customs, a gentleman possessed of considerable private fortune in addition to the emoluments arising from his official situation.

The Bride of the Ojibbeway.—In the *Times* of Saturday was a paragraph copied from the *Patriot*, stating that "the wife of the Ojibbeway Indian had returned to the parental roof, being unable to live happily with her husband." The father of the young lady has since written to state that the report is utterly false. His daughter and her husband, he says, landed at New York on the 31st August, on their way to Upper Canada.

Thames Tunnel.—On Friday, at the Auction Mart, Mr. Shuttleworth put up for sale by auction one hundred shares in the Thames Tunnel, upon which 50*l.* each had been paid, amounting to 5000*l.* The attendance of capitalists was rather numerous, but after a slight competition, the shares were knocked down to an extensive shareholder in the undertaking, at the low price of six shillings per 50*l.* share, realising only 30*l.*, and 4970*l.* less than had been paid for them. The sale was a *bonâ fide* one, the shares having been put up by the executors of a deceased gentleman.

Victoria Park.—A communication is said to have been made from the directors of the East London Waterworks to the Commissioners of Woods and Forests, in which the former liberally offer to supply two or three fountains in the Victoria-park with an abundant quantity of water gratuitously, provided it is subsequently permitted to flow into public baths to be erected in the vicinity for the use of the poor. Several benevolent gentlemen, at the head of whom is Mr. Cotton, Governor of the Bank of England, are at present projecting a plan for the erection of baths at the east end of the metropolis, where the poorer classes of society may be enabled to obtain a luxury so conducive to health, at a charge commensurate with their means. The want of public baths, or indeed any place for bathing, at the east end of the town has been much felt, and there are few ways in which their promoters can become greater benefactors to the poor.

Fire at St. George's Market.—One of the most destructive fires that have occurred in the metropolis since the burning of Topping's wharf occurred on Monday evening, shortly before eight o'clock, in a large space of ground behind the London-road, Southwark, on which was erected a large number of shops, occupied by various tradesmen, and known as St. George's Market. It broke out in the stables of a butcher, and destroyed about a dozen other buildings, 100 feet long by 35 wide, and used as butchers' stalls and miscellaneous tradesmen's sheds, together with their contents. Several houses in the neighbourhood were much damaged, and numerous parties had their furniture injured by hasty removal. The buildings were mostly insured, but their contents were, with few exceptions, uninsured.

Tottenham.—On Thursday morning an extensive fire broke out in Wood's-green Farm, Tottenham, the property of Mr. J. Forster, of Markhouse-lane, near Waltham, in the occupation of Mr. Antenbring, farmer. Flames were first perceived issuing from the roof of a cottage, near which stood a long line of shedding belonging to the farm. With great rapidity the fire spread from shed to shed, until the granaries, brewhouse, and outbuildings were in flames. The whole of these with their contents were destroyed, but the farm-house was saved. The property was insured, but the amount of damage is not known.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Oct. 5: West Districts, 162; Northern, 140; Central, 181; Eastern, 235; Southern, 243; Total, 961. Weekly average for the last five years, 946.

Provincial News.

Cheltenham.—A melancholy event occurred in the parish of English Bicknor, in this county, on Tuesday last, which has plunged a numerous family into affliction, and cast a gloom over the whole neighbourhood. Lieutenant-Colonel Davies, of Bicknor-court, was shooting near that place, and in the act of getting over a hedge, when his gun, becoming entangled in the briars, went off, and lodged the contents of both barrels in his right side. He immediately fell, and on the keeper, who accompanied him, coming to his side, and attempting to raise him, exclaimed, "It is of no use; I am a dead man!" The keeper ran to the village for assistance, but before he could return the unfortunate gentleman breathed his last. Deceased was in his 58th year, and had been 40 years in the service of the East India Company, and had held at various times many situations of trust and importance. He returned from India in ill-health about two years ago, and on the very morning of the accident had despatched a letter resigning the service. He has left a widow and a large circle of relations to deplore their loss.

Liverpool.—The Liverpool *Albion* mentions a rumour that the practicability of connecting the opposite shores of the Mersey by a stupendous chain-bridge is under consideration. It is said that, by the formation of a viaduct, on the principle of an inclined plane, on arches, commencing at the top of James-street, to the margin of the river, a sufficient elevation may be obtained. A similar erection on the Woodside bank of the river would, of course, be requisite. Such a work would throw all suspension bridges into the shade, and the enterprise would be worthy the combined energies of Liverpool and Birkenhead.—Messrs. Bury and Co., of this town, engineers, have been commissioned by the Emperor of Russia to supply the iron work of an iron bridge, to cross the Neva, at St. Petersburg, as a substitute for the present bridge of boats. The bridge will be 1078 feet long, with seven arches, the centre one being 156 feet span; there will be a swivel bridge, 70 feet wide, to allow the passage of ships, the bridge itself being of small altitude; the carriage and pathways will be, together, 70 feet in width; and the weight of iron will probably be little short of 10,000 tons, and of the value of 100,000*l.*

Manchester.—The *soirée* of the Manchester Athenæum took place on Thursday week at the Free Trade Hall, and was remarkable for the attendance of the leading members of that party which is now generally known as "Young England." Mr. B. D'Israeli, MP. presided, and in opening the proceedings congratulated the meeting on the flourishing state of the Institution, and detailed at some length the measures taken by them to carry out its objects. After alluding to the prejudice excited against the Institution by the suspicion of party politics, Mr. D'Israeli said:—

"I confess, it appears to me that it would have been a marvel had it been otherwise. When we remember the great changes that had then but very recently occurred in this country—when we recall to our mind not only the great changes that had occurred, but the still greater that were menaced and discussed—when we remember what an influence is created when local jealousy blends with political passion—it is not difficult to imagine, because there are none of us present but in their sphere must have felt its influence—it is not wonderful that men of different political opinions should look with extreme jealousy upon each other. A combination of peculiar circumstances that created a balanced state of parties in those places where the struggle for dominion and power take place very much assisted this feeling; and that such a feeling existed throughout all England in a degree more intense and more virulent than has ever been equalled in the history of this country, I think no man will deny, and all must deplore. For my part, I believe that had that party and sectarian feeling proceeded in the same power and virulence it has done for the last twelve or fourteen years, it must have exercised a barbarising influence upon public sentiments and public manners. There are some amongst us now, I know, who believe that the period has arrived when a great effort must be made to emancipate this country from the degrading thraldom of faction; to terminate, if possible, that extreme, that sectarian, and limited view, in which all human conduct is examined, observed and criticised—to put an end to exclusiveness, which, in its peculiar sphere, is equally deleterious as that aristocratical exclusiveness of manners which has produced so much evil; and, as far as I can form an opinion, these views have met with sympathy from every part of the country. Heretofore society was established necessarily on a very different principle to that which is now its basis. As civilisation has gradually progressed it has equalised the physical qualities of man. Instead of the strong arm, it is the strong head that is now the moving principle of society. You have disenthroned Force, and placed on her high seat Intelligence; and the consequence of this great revolution is, that it has become the duty and delight of every citizen to cultivate his faculties. The prince of all philosophy has told you, in an immortal apopthegm, so familiar to you all that it is written now in your halls and chambers, 'Knowledge is power.' If that memorable passage had been perused by the student who first announced this discovery of that great man to society, he would have found an oracle not less striking, and in my mind certainly not less true, for Lord Bacon has not only said that 'knowledge is power,' but, living one century after the discovery of the printing-press, he has also announced to the world that 'knowledge is pleasure.' A man who knows nothing but the history of the passing hour, who knows nothing of the history of the past, but that a certain person whose brain was as vacant as his own occupied the same house as himself, who in a moment of despondency or of gloom has no hope in the morrow because he has read nothing that has taught him that the morrow has any changes—that man, compared with him who has read the most ordinary abridgment of history or the most common philosophical speculation, is as distinct and different an animal as if he had fallen from some other planet, was influenced by a different organisation, working for a different end, and hoping for a different result. It is knowledge that equalises the social condition of man—that gives to all our political position, passions which are in common, and enjoyments which are universal. It is like the ladder in the patriarch's mystic dream. Its base rests on the primeval earth—its crest is lost in the shadowy splendour of the empyrean, while the great authors that for traditionary ages have held the chain of science and philosophy, of poesy and erudition, are like the angels ascending and descending on the sacred scale, and maintaining, as it were, the communication between man and Heaven. This feeling is so universal that there is no combination of society in any age in which it has not developed itself. I would say one word, then, to those for whom this Institution is not entirely, but principally formed. I would address myself to that youth on whom the hopes of all societies repose and depend. I doubt not that they feel conscious of the position which they occupy—a position which, under all circumstances, at all periods, in every clime and country, is one replete with duty. The youth of a nation are the trustees of posterity; but the youth I address have duties peculiar to the position which they occupy. They are the rising generation of a society unprecedented in the history of the world, that is at once powerful and new. In other parts of the kingdom the remains of an ancient civilisation are prepared ever to guide, to cultivate, to influence the rising mind; but they are born in a miraculous creation of novel powers, and it is rather a providential instinct that has developed the necessary means of maintaining the order of your new civilisation than the matured foresight of man. This is their inheritance. They will be called on to perform duties—great duties. I, for one, wish for their sakes and for the sake of my country, that they may be performed greatly. I give to them that counsel which I have ever given to youth, and which I believe to be the wisest and the best,—I tell them to aspire. I believe that the man who does not look up will look down; and that the spirit that does not dare to soar is destined perhaps to grovel. Every individual is entitled to aspire to that position which he believes his faculties qualify him to occupy. The leaders of their community have not been remiss in regard to the interests of youth. Let them remember that when the inheritance devolves upon them they are not only to enjoy but to improve. They will some day succeed to the high places of this great community; let them recollect those who lighted the way for them, and when they have wealth, when they have authority, when they have power, let it not be said that they were deficient in public virtue and public spirit. When the torch is delivered to them, let them also lead the path of human progress to educated man."—Mr. Cobden next addressed the assembly, and was loudly cheered. He felt no greater difficulty in addressing an audience than to find himself in a position where he had nothing to prove and nothing to deny. That was precisely his position on the present occasion. He was sure he spoke the language and the feeling of every member of the Athenæum, when he said he should regard that man as the greatest enemy to his kind who should ever dream of converting that institution to any party or political purpose. He could not help congratulating himself, while Mr. D'Israeli was speaking, that with Lord John Manners on the one side, and Mr. Smythe on the other, the imputation of party must be an absolute contradiction. He thanked them for coming among them, and producing so admirable a result as they had witnessed that night. In his delightful novel of "Coningsby," Mr. D'Israeli said, speaking of Manchester, "It is the philosopher only who can understand and predict the future destiny of Manchester." He would venture to say that the philosopher would have but one test for the future greatness of Manchester, and it would be a mental not a material test. The test would not be the expanse of bricks and mortar, nor the multiplication of steam-engines and the accumulation of wealth. Just in proportion as mental development proceeded in a becoming ratio with the development of wealth and material resources, would their destiny be dignified and exalted, or the very reverse. Manchester stood upon an eminence; they were not in that position in which they could shrink from that test. They were increasing in numbers, they were accumulating in wealth, and therefore, unless at the same time they made progress in those moral and intellectual developments to which he had referred, the expansive power of her mills would contribute to the doom rather than to the honour of Manchester. He spoke not merely of Manchester, but of the surrounding districts; Manchester had its satellites of towns as large as ancient cities—those ancient cities which had become celebrated in the world's history, not for their wealth, not for their increase of numbers, but because they had left traces of the arts and literature in the efforts of its immortal men of genius. He therefore called upon the deputies from the surrounding towns of Blackburn, Stockport, Oldham, &c., to let this be the beginning of an effort to establish in those towns an Athenæum, and thus render their community worthy of the wealth and reason they possessed. He would only add, they were Young Manchester, and he rejoiced to think they had Young England with them. Let them go on as they had done, and apply the same energy to that and kindred institutions, and let them proceed in the firm belief that they were not only adding to their own stores of happiness, but tending to elevate the community among which they lived, for upon them would depend the future greatness of Manchester and the surrounding community.—Lord John Manners next addressed the meeting. In the course of his speech he remarked: "The magnificent example set by Manchester to all other large towns, and with which all England is at this moment ringing, that great undertaking to provide parks and walks for all classes of the community—open alike to the highest and the lowest—shows how well that truth is understood in Manchester, and I trust, before long, it will be followed by another step in the same direction, the opening of museums and collections of that nature to the people at large. Most encouraging indeed is it to witness the eagerness with which the people everywhere avail themselves of every opportunity which is offered them to frequent exhibitions of art, places of innocent amusement—still more gratifying their demeanour while there."—The Hon. Mr. Smythe, M.P., was the next speaker. He said: "I am less unreserved by the external splendour of this fair pageant than by the thought, the idea, the elevated principle of which it is the expression. You represent a great necessity. It seems to me that you, the men of Manchester, have determined to do honour to literature, in a land where literature has too long been neglected

It seems to me that with a spirit worthy of a younger and freer age, you have resolved to proffer to the author and the man of letters a reward of a simpler and less sordid character than the pay of this newspaper, or the hire of that review. Or with yet more profound and far-sighted intentions you may have resolved to redress the anomalies of a country which is governed by its journals, but where the names of its journalists are never mentioned; of a country where, by the most unhappy of conversions, it is the inventions which make the fortune, and it is the inventors who starve; of a country where, if a man of science aspires to its highest honours—the suffrages of his fellow-citizens—that man of science will poll by units, where the mere politician polls by hundreds. And it seems especially meet that you, the men of Manchester, should correct these evils, because there is an old, an intimate, and natural alliance between literature and commerce. It is in virtue of this alliance that you cannot but regard with sympathy the homage which you see done by foreigners to letters. Why, the very ambassadors whom they send to this court are so many reproaches to our neglect of them. Who is the ambassador from Russia? A man who has risen by his pen. Who from Sweden? The historian of British India. Who from Prussia? A professor. Who from Belgium? A man who has risen by literature. Who from France? An author and an historian. Who from America? An author and professor. But it requires no extraordinary spell of divination to prophesy to the literature which shall derive its impulse from such a meeting as the present—which shall result from such incentives—which shall be fostered and encouraged by such sympathy as yours—a destiny yet more lasting and auspicious, because, as it will not be patronised by monarchs nor fashioned by nobles, nor confined by prejudice, so it will be free, independent, universal, and, above all, tolerant, as your own free, independent, universal, and tolerant commerce. But here, even in this pleasant hour of convivial intercourse, when men of all parties and all shades of opinion are met to interchange the amenities, and courtesies, and fair civilities of life, it is impossible not to remember how many and how illustrious have been the victims of these absurdities, these barbarities, or, what is worse, these vulgarities of our party warfare. Remember the fate of our last great man. Remember how he was proscribed as an adventurer, because he was born to no hereditary fortune; and then, when the gentle-judging and the generous, when men with large thoughts and fine feelings, when the few rallied round him against the many, he was again branded and proscribed, because they were a few, as a caballer and intriguer. Remember how in high life his views were thwarted, his spirit cowed, his heart broken—how he was hasted to his grave, and then you will understand how, through calumny and misconstruction—through such men's envy, and the insults of men yet smaller—he must often have pined for some such neutral ground as this, to which his harassed spirit might have flown away, and been at rest. And how, in the prospect of a happier hour, of advancing toleration, such as this meeting affords—even with such eloquence as we have heard to-day—there are few among us, now that fifteen years have passed over his grave, who will hesitate to exclaim with me, 'Oh, for one hour of George Canning!' But even among those who hear me there may be some who think that I am stating results too grave and too important to this meeting in thus speaking of advancing toleration; there may be some who argue it a mere communication and nothing more. Such I think no thoughtful opinion; because it is impossible to study our history for the last half century and not perceive that Manchester has always been foremost in the great work of national advancement. It is not because you did as much, perhaps, as all our subsidies, or all our arms, in our long war with Napoleon—it is not because, since the peace, you have done far more than all our ministers to promote the common weal—but it seems to me that you have carried your national triumphs to the remotest corners of the earth, and have yet remembered that there was another world to conquer. Nor will your triumphs in the spiritual world be less remarkable. Because, that same creative power which in the world of action is called invention, and ministers to man, this same creative power in the world of thought is called genius, and governs and provides for man. But in either sphere, whether of thought or action, it is your high and holy mission to benefit mankind. There is nothing small, nothing selfish, nothing partial, nothing exclusive in the temper of British commerce. It was out of a spirit as catholic that the humanities first sprang. It will be out of a temper no less catholic that here, in the metropolis of English enterprise, great things will again be done. Because your ships and vessels are laden not alone with bales of cloths and cottons, but with goods which have neither a declared nor an official value, you carry with you truths from this free island which tend to elevate the character of man. You carry with you principles which tend to unite all nations in one fair confraternity of reciprocal assistance. And when out of a spirit thus catholic, out of a power thus universal, that old world shall have received another of those moral shocks which, like printing and steam, threw it onwards on its career; when it shall be one stage nearer its goal; when civilisation shall be one hour from its meridian, it will be remembered that this meeting had its share in the work of progress."

Several gentleman addressed the assembly, after which dancing was commenced, and carried on until a late hour.

Merstham.—On Monday evening an extensive fire occurred near the village of Merstham, Surrey, at a farm the property of Sir W. Jolliffe. All the produce of the farm was destroyed, and 10 horses, notwithstanding the exertions of the labourers to save them, were burned to death. The parish church was saved with difficulty. The origin of the fire is believed to be accidental.

Northfleet.—A disastrous fire broke out on Wednesday night in this village, about two miles on the London side of Gravesend, on the premises belonging to Mr. Mace, and known as Percy-street Farm. It originated upon the homestead, and when first perceived had obtained complete possession of a bean rick contiguous to other similar erections, in the middle of which stood a large brick barn, upwards of 100 feet long, 30 feet wide, and near 50 feet high, filled with grain. The barn was completely gutted, and the contents consumed. The cart, waggon, and agricultural implement lodges, piggeries, and cow-houses, were consumed; and three ricks of peas, two ricks of clover, one bean-stack, two wheat-ricks, and one straw-stack totally destroyed. The total loss is estimated at between 2000*l.* and 3000*l.*, but the proprietor was insured in the Kent Fire-office. There is little doubt that the fire was caused by an incendiary.

Oxford.—The election of Vice-Chancellor for the ensuing year took place on Tuesday, and the unprecedented influx of Members of Convocation fully justified the anticipations which had been formed of its importance. On no occasion since the defeat of Sir R. Peel in 1829, has such excitement prevailed among the electoral body of Alma Mater. The proceedings in the theatre commenced about half-past one o'clock, when the usual forms were gone through, and the Chancellor's letter, nominating Dr. Symons as Vice-Chancellor, was read. Upon the "assent" of the masters being demanded to the nomination, the cry of "placet" was answered by that of "non placet," and a scrutiny was demanded. The voting, owing to the immense numbers present, occupied a considerable time, and at the end it appeared that the numbers stood thus—placets 882; non-placets, 183—majority, 699. The Vice Chancellor and his successor then addressed the Convocation, and the latter appointed Dr. Wynter, late Vice Chancellor; Dr. Hawkins, Provost of Oriel; Dr. Plumptre, Master of University; and Dr. Radford, Rector of Lincoln, as Pro Vice Chancellors. Among those who voted on this occasion were the Bishops of Chichester and Llandaff, Lord Sandon, Lord Ashley, Lord Eldon, Lord Stavordale, Sir T. D. Acland, Mr. Henley, M.P., &c.

Sunderland.—The local papers state that measures are in progress for relieving, as far as public sympathy can relieve the sufferings of the widows and orphans who have been left helpless and unprovided for by the late calamity at Haswell colliery, and there is no doubt that in a few days these proceedings will assume a more formal and general character, and that the public bounty will be exercised on a scale of benevolence worthy of the occasion. Mr. Burdon, the chairman of the quarter sessions, and some ladies and gentlemen in the neighbourhood of Castle Eden, have opened the subscription by handsome contributions; and Mr. Bright, the member for Durham, has, without solicitation, generously contributed the sum of 50*l.*—Letters have been received from the Home-office, expressive of the regret of Sir. J. Graham at the outrages committed against the person and property of Belaney since his return to North Sunderland. Government has joined in offering a reward of 100*l.* for the apprehension and conviction of the offenders who set fire to his dwelling-house on the 18th ult., and Her Majesty's pardon to any accomplice informant. An inspector of police has been sent down to inquire into the nature and particulars of the recent outrage. He has been actively engaged for the last few days, and on the 7th inst. laid informations against Mr. Bell, late clerk of the firm of Robson and Skelly, and three other persons of the names of Steavenson, Brown, and Galligar, as principals at the incendiary fire of the 18th. The magistrate for the district, after hearing the evidence collected by the inspector, granted warrants for the apprehension of the parties, who were to be brought before a special petty sessions to be held for the purpose on Wednesday, at Belford. A warrant was also granted to search the dwelling-house of Mr. Bell for property belonging to Belaney, which he is charged with having improperly taken away.

Tynemouth.—The committee of the subscribers to the monument proposed to be erected to the memory of the late Lord Collingwood, have resolved upon completing the undertaking forthwith, in reliance on the public for the amount of money yet deficient. It appears that upwards of 2000*l.* have been already placed at the disposal of the committee, and it is calculated that another thousand will be sufficient to finish the work. The architectural design for the monument, by Mr. Dobson, of Newcastle, has been selected by the committee, and the execution of the colossal figure has been intrusted to Mr. Lough, the sculptor of the bust of Her Majesty to be placed in the New Royal Exchange. It was at one time contemplated to place the monument in the Castle-yard at Tynemouth, but a more eligible site has since been fixed upon, near the entrance of the river, the ground having been given by the Duke of Northumberland, in addition to his donation of 500*l.* It will form a striking object to mariners navigating the coast, and the land surrounding it will be laid out with public walks.

Warwick.—In the spring of the present year a young lady, named Jane Page, was abducted from the boarding-school of Miss Kimberley, in this city, and subsequently recovered at an hotel in the Isle of Man. The young lady, who is the daughter of a respectable farmer, at Stretton, was only 13 years of age; while George Gardener, the young man with whom she decamped, was some years above 20, and also respectably connected. Gardener was tried for the felony at the Warwick spring assizes, but in consequence of the intimacy between the families, and from other causes, a compromise was effected, Gardener pleaded "Guilty," and the Judge passed upon him a mere nominal punishment. He was ordered to enter into his own recognizance in the sum of 500*l.* towards Mr. Page and his family. Nothing more was heard of him by the public until last week, when it transpired that he had poisoned himself in the house of Mr. Page, during that gentleman's absence. It appears that he had returned from America, where he had been unsuccessful in procuring employment, and early on Wednesday morning he contrived to effect an entrance into the bedroom of Miss Page and her sister by means of a hurdle, and almost immediately took poison. Mrs. Page on being informed of the circumstance sent for a nurse in the village, but would not call in a surgeon because her husband was from home. The medical witness stated his belief that deceased died from opium. The Jury found a verdict of *felo-de-se*; and at the same time declared their unanimous opinion, that the conduct of Mrs. Page towards deceased during the time he was in a dying state was most unfeeling and unchristian, and desired the coroner to convey to her the strongest censure on her conduct.

York.—On Saturday week, about half past six, P.M., Mr. W. Inchbold, farmer, of Low Dunsforth, and well known in this city, was twice shot at by a man who had concealed himself behind a manure-heap. The contents of the first charge were lodged in the back of Mr. Inchbold, and those of the second dreadfully shattered his left arm and other parts of his body. He was afterwards found and conveyed home, where he lingered in great agony until Monday, when he expired. An inquest was held on the body on Wednesday and Thursday, when several witnesses were examined, whose testimony appeared to implicate a man named Kendrew, of Aldborough. After the sitting of Thursday, the coroner adjourned the meeting for a week, in order to procure further evidence.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 3020*l.*; Bristol and Gloucester, 1309*l.*; Eastern Counties, 4429*l.*; Edinburgh and Glasgow, 2585*l.*; Great Western, 17,890*l.*; Grand Junction, 8196*l.*; Glasgow, Paisley, and Ayr, 1656*l.*; Great North of England, 2169*l.*; London and Birmingham, 19,756*l.*; South Western, 7015*l.*; Blackwall, 1035*l.*; Greenwich, 805*l.*; Brighton, 5933*l.*; Croydon, 534*l.*; Liverpool and Manchester, 5100*l.*; Manchester, Leeds, and Hull, associated, 8259*l.*; Midland, 11,958*l.*; Manchester and Birmingham, 3903*l.*; Newcastle and Carlisle, 1747*l.*; Newcastle and Darlington, 1214*l.*; South-Eastern and Dover, 7136*l.*; Sheffield and Manchester, 792*l.*; York and North Midland, with Leeds and Selby, 3604*l.*; Yarmouth and Norwich, 380*l.*—The Irish Great Western and Southern Railway Company have decided upon the extension of the line to Cork and Limerick, with the view of carrying out and connecting the contiguous undertakings, so that they may fully participate in the traffic derivable from all points. It is estimated that the railway will run through and be available to places containing in the aggregate a population of upwards of 3,000,000.—The Chester and Holyhead Railway have finally negotiated their bargain with Government for the mail service on the line. The company are to convey two up and two down mails daily, for five years, for a payment of 30,000*l.* per annum; and for a further term of seven years at 30,000*l.* per annum as a maximum, but which maximum shall be subject to reduction to any sum not less than 1*s.* $2\frac{1}{10}d.$ per single mile (equal to about 7270*l.* per annum), fluctuating between these two amounts according to the sum required to allow a return of 5 per cent. on the capital subscribed. But in no case, whatever the return to the company may be, is the payment by Government during the said seven years to exceed 30,000*l.* per annum, nor be less than the sum of 1*s.* $2\frac{1}{10}d.$ per single mile.—On Thursday week the foundation-stone of the monster bridge for the Lancaster and Carlisle railway, of seven arches of 60 feet span each, and upwards of 104 feet high, which is intended to cross the river Lowther at a romantic spot called Yew's Crag, near Brougham Hall and the village of Clifton, was laid in the presence of several of the directors and a large concourse of people from Penrith and the surrounding districts.—On Saturday morning, shortly after midnight, a monster train, divided into two parts for the convenience of conveying passengers to the Bricklayers' Arms and the London terminus, left Croydon with about 700 persons. The London passengers took their places first, and the train started off, followed in a few minutes by those for the Bricklayers' Arms. The train for London reached the Annerly station about 20 minutes before 1, where, unfortunately, the lamp at the tail of the train went out for want of oil. This circumstance not being observed by the conductor, the train went on, followed immediately by the second one, when in less than a minute a collision took place. The greater part of the passengers were asleep in both trains, having been spending the day at Croydon Fair, and were returning at a late hour much fatigued. They awoke out of their slumbers in the greatest consternation. On stopping the trains lamps were procured, when it was discovered that one of the carriages had been forced off the line and much damaged. A first-class carriage in the London train was much broken, and the panels smashed. The last carriage was broken into splinters. The injured persons, between thirty-five and forty in number, were speedily released from their painful situation, and proceeded to the Annerly Arms public house, where they remained upwards of an hour, during which the trains were put in order. Many of the sufferers, both male and female, presented severe contusions of the head, arms, and body, and two females were severely cut on the temple and eye, and put under the care of a surgeon. Another collision took place on the same line on Monday night. It appears that shortly before nine o'clock, as the Dover mail train was leaving the terminus at London-bridge, the Croydon train had just arrived, and was about to turn off the points, when the engine of the latter came in contact with the Dover train, and smashed the lower parts of the carriages to pieces, literally cutting off all the steps on that side. One of the ticket collectors had a very narrow escape of having his legs cut off by the collision. He was standing on the steps of one of the carriages at the time, and had the presence of mind to precipitate himself into the carriage, to the astonishment of the passengers, who were much alarmed for his safety. The overland mail was being conveyed by the Dover train, and owing to the above accident and stoppages on the line for pilot engines to assist them up the inclined planes, the train did not arrive at its destination until half an hour beyond its time. The consequence was that the steamer had started, and a vessel was specially engaged to convey the mail across the Channel, the expense of which will fall heavily on the company, as they may be compelled to convey the mail to Marseilles.—On Tuesday an important meeting of the Midland Railway Company, which has lately been so styled, owing to the amalgamation into one court of proprietors of the

shareholders of the Birmingham and Derby, the North Midland, and the Midland Counties Companies, was held at the railway station, Derby. The meeting was made special for the purpose of considering the expediency of an application to Parliament for power to enable the Midland Company, or some of the company or companies in connection with them, to make the following lines of railway or any of them, viz. :—1. A railway from the Midland Railway at Nottingham to Newark and Lincoln, crossing over the river Trent. 2. A railway from the Midland Railway at Swinton by Doncaster, Bawtry, and Gainsborough to Lincoln, and thence passing near Boston, Spalding, and Wisbeach, to join the Eastern Counties Railway at March. 3. A railway from the Midland Railway at Syston, by way of Oakham and Stamford to Peterborough. Resolutions embodying these schemes were unanimously passed, and the Directors were empowered to procure the necessary funds by raising an additional capital of two millions and a half of money, by the creation of 62,500 shares of 10*l.* each, guaranteeing 4 per cent. to the holders of such shares until the works shall be completed. It was also resolved to amalgamate the Sheffield and Rotherham Railway with the Midland line, guaranteeing 6*l.* per cent. per annum on every share paid up to the Sheffield and Rotherham proprietors, the Midland taking the liabilities with the capital and stock, and working the line.—A serious accident occurred on Tuesday on the line of the Brandling Junction Railway, by which one of the passengers was killed, and fifteen others more or less injured. The accident arose from the collision of two engines, one of them attached to a carriage full of butchers on its way from Shields to Newcastle cattle market. The engineers jumped off at the time of the collision, and the engine and carriages ran on to Shields without control, and there came in contact with the empty carriages at the station, and were crushed together in one confused mass of broken fragments. Two men were killed upon the spot, fifteen severely crushed, and out of the entire number of passengers not more than five or six escaped without injury. Many will be laid up for weeks, and two are not expected to recover.

IRELAND.

Dublin.—We regret to state that Lady Heytesbury, whose serious illness we noticed in our last, expired on Sunday morning. Her medical attendants for several days had abandoned all hope of her recovery. It is generally stated that Lord Heytesbury, in consequence of this domestic affliction, has determined to resign the office of Lord Lieutenant, to which he has been so recently appointed. It is understood that his Excellency was very reluctant to undertake the duties of Viceroy, and that it was only on the earnest solicitation of Sir R. Peel that he accepted the office. It is also rumoured in Dublin that Lord Ellenborough will be appointed his successor. —The weekly meeting of the Repeal Association was held on Monday in Conciliation-hall. The Hon. G. H. Hutchinson was in the chair, and briefly addressed the meeting, dwelling on the absolute necessity there existed for carrying on the registry with vigour at the approaching sessions. It would be, he considered, of the utmost importance that the Irish people should be in a position to return at the next general election such a number of Repealers as would give weight to their party in the House of Commons. Mr. M. O'Connell commenced the proceedings of the day by saying that his letters from Derrynane stated that the Liberator was in the enjoyment of excellent health and spirits. His father had informed him that he had intended to have written to the Association that week, but he had not been able to get his letter ready in time for post; they would, however, have a long letter from him next week. He then announced the receipt of several remittances; amongst them 12*l.* from New Brunswick, 14*l.* from Glasgow, and 5*l.* from the Isle of Man, from the Rev. Mr. Magrath. In reference to the last remittance, he remarked that the bad laws which had been exterminated from every part of the British dominions, seemed to have found shelter in the Isle of Man; for at that moment there were to be found on the statute books of that island penal laws of the most stringent nature against Roman Catholics. One of those enactments to which he referred, imposed the penalty of transportation from the island on any Catholic priest who dared, in the exercise of his ministry, to perform the ceremony of marriage. Mr. O'Neill Daunt handed in 15*l.* from Clonmel, 50*l.* from Ennis, with several other sums, and read various letters which accompanied the remittances. Mr. W. J. O'Connell handed in his usual weekly contributions from the London wards, and stated that the sum of 1860*l.* had been subscribed by the Repealers of the metropolis for the present year. He then addressed the meeting on the usual topics at great length, and on concluding was loudly cheered. Mr. M. O'Connell, in moving a vote of thanks to the learned gentleman who conducted gratuitously the late registry in the city of Dublin, on behalf of the Repealers, stated that it was the intention of the Association to carry on the registry with vigour in all parts of the country through the agency of the Repeal Wardens; and he had not the slightest doubt that their ultimate hopes would be crowned with success. Mr. O'Neill Daunt seconded the motion, and then proceeded at considerable length to review the prospects of this country and its relations with England. He contended that Sir R. Peel would attempt to carry out the principle of *divide et impera*, which had been always acted upon in this country, but the popular party were too powerful to allow him to do so. The people of Ireland had set their hearts on a domestic legislature, and were determined to have it. They knew that without an independent Parliament English interests would necessarily predominate in the country. Captain Broderick, Mr. Langley, barrister, and Mr. Grattan, M.P., severally addressed the meeting. At the termination of the proceedings Mr. M. O'Connell announced the rent for the week to be 630*l.* 11*s.* 10*d.*

SCOTLAND.

Glasgow.—The inauguration of the Wellington statue took place on Tuesday last in the presence of hundreds of spectators, and with the ceremonies usual on such occasions. Sheriff Alison delivered the oration in honour of the day, and eloquently dilated on the military career of the Duke from his brilliant exploits at Assaye to the crowning victory of Waterloo. At the close of his speech the statue was uncovered amidst enthusiastic cheers from the assembled multitude, and from several regiments which had served under the Duke at Waterloo and in the Peninsula. The pedestal, which is of Peterhead granite, is 8½ feet high. On this the statue is placed, resting on a floor of bronze. The horse is the work of a bold and masterly hand, and does honour to Baron Marochetti, the sculptor. The animal has just come to a state of repose, and seems as if listening to some distant sound. The head is that of an Arab, with the broad forehead and wide nostrils, and is standing with fore feet a little in advance, in an easy posture, the reins lying slack. The position of the Duke is that of a General reviewing his troops. The likeness is taken when the Duke was in the prime of life, and the artist has avoided the very general fault of caricaturing the features. The likeness has been declared by his Grace's brother, Lord Cowley, to be perfect. The Duke is dressed in the full uniform of a field-marshal, with his different orders, the whole being most life-like and beautifully executed. The bas-reliefs are said to be the most wonderful works of their kind in Great Britain. They are placed on the south and north sides of the pedestal, and represent the first and last victories of the Duke,—namely, that of Assaye, fought on the 23d September, 1803, and Waterloo, on the 18th June, 1815. The small bas-reliefs on the east and west ends of the pedestal represent the soldier's return. The father is seen sitting in his arm-chair by the fireside, reading his Bible, and the wife is flying to meet her husband with uplifted hands, in token of joyful surprise, as the soldier opens the door. This is described as a most touching piece, which tells its tale like one of Wilkie's pictures. The other represents Peace and Agriculture, with the soldier at the plough, after all his labours, and after having saved his country from the inroads of the foe. The plough horses are exceedingly fine. The desire of the artist in this picture seems to be the representation of peaceful occupations, as the final and best conclusion to war's alarms; and he has succeeded to the life.

Dundee.—On the night of Her Majesty's departure from Dundee, the Windsor Castle steamer, with 250 passengers, who were returning to Granton after witnessing the embarkation of the Queen, was wrecked on the North Carr Rock, near Kilrenny, on the coast of Fife. The sea was beautifully still in the East Neuk of Fife, but the vessel was much nearer land than her captain imagined. The passengers were dancing on the deck, and several were below at dinner, when the steamer struck the beacon on the Carr Rock, and began rapidly to fill. After rolling about for nearly 20 minutes, she grounded between two large rocks, and thus the passengers were enabled to save themselves. The vessel however had only one small boat and one oar, and it was necessary to make six voyages to the shore before the ladies were landed. The news of the accident soon spread, and other boats having gone out to their assistance, the other passengers and crew were all saved without injury. A gale however sprung up in the night, by which the vessel was driven on a ledge of rocks, and became a total wreck. The Windsor Castle was an iron steamer, 6 years old, and one of the strongest vessels of her size afloat.

Miscellaneous.

The Order of Odd Fellows.—Some curious statistical details, illustrative of the present state of this extensive fraternity, were laid before the Metropolitan Lodge, at its late anniversary meeting. It appears, that on the 1st April last, when the returns were made up, there were in England and Wales, 3840 lodges, and 325,000 members, showing an increase of 450 lodges, and 23,000 members over the previous year's return. The subscriptions for this year amounted to 352,583*l.*: the expenditure to 300,000*l.*; leaving a balance of 52,583*l.* in favour of the association. The total amount of property belonging to the order (including pictures, flags, banners, lodge paraphernalia, official apparel, and various insignia), was estimated at 700,000*l.* Amongst the enrolled members are, 130 members of Parliament, 629 ministers of religion of various denominations, and 9000 honorary members who make no claim upon the funds. If each member were to contribute only one-halfpenny each, it would amount to 34,126*l.* a year. If they were to walk two and two, one yard asunder, the procession would extend 92 miles and 380 yards. If they walked three miles an hour it would take 30 hours 14 minutes to pass any given spot—10,214 passing every hour. The chief item of expenditure consists of the charge for medical aid afforded to the sick and indigent of the order.

African Discovery.—It is stated in a Liverpool journal that several vessels have left that port for the western coast of Africa with sealed instructions, to be opened in a certain latitude, and each carrying an experienced practical chemist, furnished with tests for ascertaining the real qualities and composition of ores and salts. The destination of these vessels—probably the pioneers of a new traffic—is understood to lie between the 20th and 30th degree of latitude on the western African coast, and their object the discovery of certain suspected veins of copper, lead, iron, or gold, stated to exist about 40 miles from the sea-coast, and in a rich and fertile country. This is a new and bold experiment, and one that at all events deserves success. Captain Morrell's observations on the geological character of the coast are understood to have influenced to a considerable degree the undertakers of the enterprise, who are very confident that it will prove a fruitful one. Since the opening of the trade from Ichaboe, a great many rumours have been afloat of the mineral treasures of the coast, and the sailors of several vessels from the Clyde have brought home bags of sand, impregnated with a shining substance, which they firmly believed to be gold. An analysis disappointed the treasure-seekers, but the fitters out of the present enterprise have determined to settle the question by sending out the means of ascertaining the real mineral condition of the country upon the spot.

The Comet.—The present comet has approached within 30,000,000 miles' distance from the earth. It is now very slowly receding from us, and on the 17th will be 41 millions of miles distant from the earth. The comet was at its least distance from the sun on the evening of September 1st. The most favourable time for observing it will be from 10 P.M. to two hours after midnight, during the first half of the present month. It is generally supposed that it is the same as that observed by Halley in 1585. Sir James South has published the following instructions for finding the comet by the neighbouring stars. "At 9 in the evening, at an altitude of about 9 deg., bearing S.E.; at 10 o'clock, at an altitude of about 14 deg., bearing S.E. by S.; at 11 o'clock, at an altitude of about 18 deg., bearing S. by E.; at midnight, at an altisude of about 20 deg., and nearly due south, will be seen a star remarkable beyond all others near it for its splendour, which star is Beta Ceti. Considerably above it, and some degrees to the west, is the planet Jupiter. Nearly half way between Beta Ceti and Jupiter lies the star Iota Ceti. To the north-east, and forming nearly an equiteral triangle with Beta and Iota Ceti, is the star Eta Ceti; and at little less than half the distance from it that Beta Ceti is from Iota will be found another star of similar brightness, and which star is Theta Ceti. These two stars, Eta and Theta, with two below them, which are Zeta and Tau Ceti (Zeta being north-east of Tau), form a quadrangle too conspicuous to be disregarded. The star Theta, the most northern one of the quadrangle, is the most important one, for if it be brought into the field of a night-glass, near some part of the circumference of the field, the comet will for some nights be seen in the field also; but from about the 7th to the 13th, it will be well to direct the night-glass to a part of the heavens about one diameter of its field (generally about 6 degrees) above the star Theta, and about as much to the east of it, and then the comet can scarcely escape detection. If a 42-inch achromatic and a power of 30 or 40 be used, by sweeping in the neighbourhood above described, the observer will have but little difficulty in finding it—with such a telescope, and a power of 80 or 120, the nucleus will be distinctly shown."

The Royal Album.—His Majesty Louis-Philippe has brought over as a present to the Queen an album containing drawings by the first French artists, representing scenes and events connected with Her Majesty's visit to the Château d'Eu. The following is the description given of it in the *Gazette des Beaux Arts*:—"It would have been difficult to have executed with more magnificence, perfection, and exquisite taste, a work of which the idea is the perfection of delicacy, and which will contribute to place the works of our cotemporaneous artists amongst the wonders of Windsor. The album is of uncommon dimensions—18 inches by 28, and 4 inches thick. The water-colour drawings, of which there are 32, are encased in Bristol boards, to prevent them from being rubbed. The following are the subjects represented in the drawings:—1, the Queen arrives within sight of Tréport; 2, the King proceeds from Tréport to board the Queen's yacht; 3, the Queen receives the King of the French on board her yacht; 4, the Queen of the French receives Queen Victoria at Tréport; 5, Presentation of Queen Victoria at Tréport; 6, Arrival at the Château d'Eu; 7, Queen Victoria is saluted by the National Guard and the troops in the court of the Château; 8, the Apartments of Queen Victoria and Prince Albert at the Château d'Eu—the Queen's drawing-room; 9, the Queen's bedchamber; 10, the Queen's cabinet; 11, Prince Albert's bedchamber; 12, Presentation to Queen Victoria in the gallery of the Guises; 13, Pavilion of Montpensier in the park of the Château; 14, the Queen of the French's bedchamber; 15, Madame Adelaide's bedchamber; 16, promenade to Mount Huon and to Tréport; 17, return by the park; 18, family parlour; 19, breakfast at Mount Orleans, in the Forest d'Eu; 20, departure from the forest, return to the Château; 21, concert in the Gallery of the Guises; 22, his Royal Highness Prince Albert conducted by the Prince de Joinville, the Dukes d'Aumale and Montpensier, to a review of the 1st Regiment of Carabineers; 23, gallery on the ground-floor of the Château; 24, chapel of the Château d'Eu; 25, Church of Saint Laurent; 26, crypt of the Church of Saint Laurent, the tomb of the Counts d'Eu; 27, a relay of post-horses at the Prince's tree in the Forest d'Eu; 28, breakfast under Saint Catherine's oak in the Forest d'Eu; 29, the grand staircase of the Château d'Eu; 30, breakfast parlour in the Château; 31, Queen Victoria quitting Tréport in the King's barge; 32, adieus on board the

Royal yacht Victoria and Albert.—Thursday, Sept. 7, 1843. The binding of this precious album is remarkable for its exquisite taste. The ground is of fine morocco leather, of a c imson colour, ornamented with gold filagree work, representing the arms of England. The album is inclosed in a rich case covered with violet-coloured morocco, and embroidered with the arms of England."

Cockneys in Scotland.—Among the many ridiculous blunders committed by the reporters for the London press at Blair, with reference to the names and localities, none is more absurd than an anecdote which represents Her Majesty looking on at a "sheep-shearing" in September. The black-faced breed are unquestionably a hardy race, but we question their ability to lose their fleeces so near the end of autumn. We presume their informant had spoken simply of shearers, which is the Scottish term for reapers; but the former being exclusively used in the south country as applied to sheep, the mistake has thus arisen. To complete the absurdity, and also to expose the "illustrated" system, the *Pictorial Times* of last week actually contains an engraving representing Her Majesty and Prince Albert overlooking a body of sheep shearers, and the latter patting a terrier—all agreeable to the newspaper paragraph.—*Perth Courier.*

Isthmus of Panama.—"We are credibly informed," says the *Courrier Francais*, "that the hopes entertained with regard to the piercing of the Isthmus of Panama have not been realised. M. Gazella has returned to France, after having explored the isthmus, and ascertained that the point at which the junction between the two seas was contemplated was not ten metres (30 feet) above the level of the sea, as stated by the Franco-Grenada Company, but 125 metres (375 feet); so that instead of a mere trench, and a canal without a sluice, or, in other words, an artificial strait, which was deemed practicable from the survey of the engineers of the company, the canal to be opened at the point of junction would require upwards of 60 sluices. M. Gazella is a distinguished engineer of the mining department, and had been sent by the French Government to explore the isthmus, and verify the levels taken by the surveyors employed by the above company."

A Real Traveller.—A wonder has lately arrived in India in the shape of a Norwegian runner, who is about to attempt the discovery of the source of the White Nile, on foot, and unattended. He expects to be absent from this only about four months, and he is to go in a direct line, crossing deserts and swimming rivers. He runs a degree in 12 hours, and can go three days without food or water, by merely taking a sip or two of syrup of raspberries, of which he carries a small bottle; and when he does procure food, a very moderate quantity will suffice; but when it is plentiful he eats enough for three days. This wonderful man carries with him only a map, a compass, and a Norwegian axe. He has already made some wonderful journeys, having gone from Constantinople to Calcutta and back in 59 days, for which the Sultan gave him 2000 dollars; and from Paris to St. Petersburgh in 13 days. He has certificates from the authorities at Calcutta and St. Petersburgh verifying these very extraordinary facts. He is about 45 years of age, and slightly made. He trusts for safety in perilous journeys to his speed, as he says neither dromedary nor man can overtake him.—*Indian Paper.*

Law.

Insolvent Debtors' Court.—*John William Turner* was opposed by Mr. Cooke for a creditor named Hampden. The hearing of this insolvent was appointed to take place one day last week, but he ventured to appear in court in a state not fit to be examined, and his case was adjourned. The insolvent was a market-gardener at Hammersmith. The complaint was, that he and his partner, Mr. Baker, had ordered of the opposing creditor a number of baskets to pack his fruit for Covent garden Market, to the value of about 10*l.*, and on being applied to for payment, he said he was about dissolving partnership with Mr. Baker, and had nothing to do with it, and if he was sued he would put the creditor to every possible expense, and then take the benefit of the Act. An action was commenced, and he kept his word. The verdict ultimately recorded against him was, damages 9*l.* 17*s.*, costs, 22*l.* 16*s.* If he had suffered judgment to go by default, the costs would not have amounted to above 5*l.* or 6*l.* An investigation took place respecting the insolvent's affairs. According to the evidence, one of his principal grounds for defending the action at the trial was, that there was not a partnership between himself and Baker. He now admitted that there was: and it appeared that it was dissolved in consequence of the insolvent's intemperate habits. It was further elicited that a debt of about 5*l.*, due from Mr. Giddings, the fruit salesman of Covent-garden Market, was not yet paid, and that the insolvent kept a book, respecting the contents of which he gave a very contradictory description. Mr. Commissioner Pollock said that the book must be produced, and the schedule amended. When that was done the court would pronounce judgment. The case was adjourned for that purpose.

BIRTHS.—On the 2d inst., at his residence at the Highway, Enfield, the lady of Dr. J. Jamieson, of a son—2d inst., at Riverhill, near Sevenoaks, the lady of J. Rogers, Esq., of a daughter—3d inst., at Lewes, the lady of the Rev. W. E. Allfree, rector of Southease, of a daughter—4th inst., at Gresham-place, Dalston, Mrs. F. Price, of a daughter—4th inst., at 10, Doughty-street, Mrs. E. Strick, of a daughter—5th inst., at 26, Montagu-place, Mrs. B. Gaselee, of a daughter—5th inst., at Champion Grove, the lady of E. Younge, barrister-at-law, of a son—5th inst., the lady of P. Baker, Esq., of Euston-square, of a daughter—6th inst., the lady of G. W. Hearn, Esq., of the Royal Military College, Sandhurst, a Professor of Mathematics in that institution, of a son—8th inst., in Clifton place, the lady of F. Trower, Esq., of a daughter—8th inst., in Grosvenor-square, Lady Winnington, of a daughter.

MARRIAGES.—On the 2d inst., at Skendleby Church, J. B. Fletcher, Esq., of Woodthorpe, Lincolnshire, and Pagham, Sussex, to Sarah V. Holland, youngest daughter of J. Holland, Esq., of Skendleby Thorpe, Lincolnshire—3d inst., at All Saints, Stamford, Lincolnshire, G. Sayle, Esq., surgeon, of King Staith-square, Lynn, Norfolk, to Harriet Fysh, daughter of J. H. Fysh, Esq., of the former place—3d inst., at the Church of the Holy Trinity, Brompton, F. Hudson, Esq., of Alexander-square, Brompton, to Sarah Gunthorpe, eldest daughter of G. Gunthorpe, Esq., of Newington-place, Kensington—5th inst., at St. Marylebone Church, R. Price, Esq., of Highfields Park, Withyam, Sussex, to Emily Burgoyne, daughter of T. J. Burgoyne, Esq., of Stratford-place.

DEATHS.—On the 2d inst., at Bedale Hall, in the county of York, Admiral Sir J. P. Beresford, Bart., aged 71—2d inst., at Epsom, where she had gone for change of air, the Hon. Charlotte Bowes Lyon, eldest daughter of the late, and sister of the present Lord Glamis, aged 18—2d inst., at Baglau Cottage, near Neath, the residence of her son-in-law, William Gilbertson, Esq., Eliza Bramah, widow of the late F. Bramah, civil engineer, aged 53—3d inst., at Hurst-house, Lancashire, Sarah Willis, third daughter of the late R. Willis, Esq., of Halsnead, in the same county—4th inst., Lieutenant John Lewis, 48th Regiment Madras Native Infantry, only son of the late Rear-Admiral Lewis, and grandson of the late Major-General Lewis—5th inst., at his residence, Great Malvern, W. Wall, Esq., of Worcester, aged 79—6th inst., at Brighton, of apoplexy, Lady Hayter, the wife of Sir George Hayter, Principal Painter in Ordinary to Her Majesty—6th inst., at Torquay, Katharine Pollard, wife of W. Pollard, Esq., and eldest daughter of the late Rev. J. Symons, Rector of Whitburn, Durham—7th inst., at 10, Pittville-parade, Cheltenham, J. Overbury, Esq., a magistrate of the county, aged 64—7th inst., suddenly, at Titness Park, Sunning-hill, Harriet Ricardo, widow of the late J. Ricardo, Esq., aged 58—9th inst., at his house in Grosvenor-street, the Very Rev. R. Hodgson, D.D., Dean of Carlisle, and rector of St. George's, Hanover-square—10th inst., at his house, in Finsbury Circus, the Rev. Josiah Pratt, B.D., vicar of St. Stephen's, Coleman-street, and formerly for many years Secretary to the Church Missionary Society, aged 76.—9th inst., Ann Docksey, wife of J. Docksey, Esq., of Doughty-street—9th inst., at Kingston-upon-Thames, Mr. W. Walton, jun., aged 51—10th inst., at Notting-hill, of consumption, F. Oliver, Esq., of 7, Aldermanbury, aged 29.

Price Sixpence, free by post Sevenpence.

The Lancet,

Of Saturday last, October 5, contains:—

A COURSE of LECTURES on ORGANIC CHEMISTRY, delivered during the Winter Session, 1844, in the University of Giessen, by JUSTUS LIEBIG:—
On Certain Compound Radicals containing Platinum; their Analogy with Organic Bases.

FOREIGN DEPARTMENT:
Pathological Endurance in the Insane.
Cure of Acute Mania by Pleuro-pneumonia.
Means of Arresting Hæmorrhage from Leech-bites.
Formation of an Artificial Anus in the Lumbar Region, by M. Malgaigne.
Foreign Bodies in the Rectum.
Extirpation of the Uterus for complete Inversion.

ORIGINAL PAPERS:
On Dislocation of the Astragalus, with the lower ends of the Tibula and Fibula inwards, by Henry Hancock.
Selections from a Series of Essays on General Pathology, by James Bower Harrison:—
No. III.—Of Constitutional Peculiarity in Disease.
Tables of the Mortality after Operations, by Thomas Inman.
Some further Practical Remarks on the Treatment of Ovarian Dropsy, by Isaac B. Brown.
On an Improved Mode of Managing Blisters, by John Key Robertson.
Sulphate of Iron combined with an Alkaline Carbonate, an Antidote for Prussic Acid, by J. and J. H. Smith.

BRITISH, INDIAN, and AMERICAN MEDICAL JOURNALS:
Elephantiasis Scroti.—Vesicular Polypus of Os Uteri.—Treatment of Plethora by Saline Medicines.—On Enuresis Nocturna, or Incontinence of Urine during Sleep.—Aneurism of the Aorta obscure in its Diagnosis.—On Preserving Bodies for Dissection.—The Presence of Animalculæ in the Blood.—Hocussing as practised in India.

CHEMISTRY, PHARMACY, AND MATERIA MEDICA:
A Test for Bile.—The Volatile Oils of Butter.—Analysis of Ergot of Rye.—Urinary Calculi in Reptiles.—Decomposition of Tinct. Opii by Ammonia.—Preparation of Extracts of Narcotic Plants in Small Quantities.

The Hydrostatic Bed.—Cysts in the Anterior Chamber of the Eye.—The Government Medical Reform Bill.—The London Cutaneous Infirmary.—University of London.

REVIEWS:
Chemistry, as exemplifying the Wisdom and Beneficence of God, by George Fownes.

MEETINGS:
The Government Medical Reform Bill—Medical Protection Assembly.—Protest of the Medical Protection Assembly.—British Medical Association.—Chatham, Essex, Islington, Rochdale, Rochester, Shrewsbury.—British Association at York.—Medical Society of London.

HOSPITAL REPORTS:
London Hospital—Partial Solution of Callus from Low Living.—Partial Solution of Callus consequent on an Attack of Rheumatic Fever.—Dislocation of the Femur on to the Ischiatic Notch.—Backward Dislocation of the Carpus.
Lock Hospital—Syphilitical Rupia.

News of the Week.—Apothecaries' Hall.—Correspondents.

London: John Churchill, Princes-street, Soho; and may be had of all Booksellers and Newsmen.

LITERARY LEAVES; or, Prose and Verse.
By DAVID LESTER RICHARDSON.
2 vols. 8vo, Second Edition, price 12*s.*

"We strongly recommend this second and enlarged edition. We can easily imagine how such writings as these, appearing from time to time in the Indian journals, must have gratified the English residents, since even here, in the midst of lions and new books, we run over the leaves with unmixed pleasure."—*Atlas.*

"His poetry derives, from his unfeigned attachment to home, a very touching beauty. Most persons who have been long absent from the place of their birth know how delicious is the feeling with which it is approached. Mr. Richardson describes this feeling with exquisite truth and tenderness .... Whatever forms of nature challenge his preference, he views them all with a poetical eye, and paints them in his verses with vividness and fidelity. We should be glad to see the poetry of these volumes detached from the prose, and sent into the world alone. It has sufficient character in it to depend on its own vitality; and we venture to predict that it will live."—*Sunday Times.*

"The essays afford some exquisite reading. We can with perfect confidence refer every man of literary taste to these volumes, which we consider an elegant and valuable contribution to the literature of our country."—*Indian News.*

"The poems are largely impregnated with Nature's best and holiest feelings. They are utterances of the writer's own heart, and they reach the hearts of his readers. They leave an impression which will not be easily or speedily effaced. The diction is in keeping with the sentiments; it is at once accurate and graceful. The same observation applies to the author's prose writings."—*Observer.*

Smith, Elder, and Co., Cornhill, London.

WANTED on Lease a Plain Comfortable House (no objection to a Farm-house), with from 15 to 30 acres of land attached, within Eight or Ten Miles West of London. The situation must be high and dry.—Particulars to T. Z., Post-office, 119, Piccadilly.

TERRA COTTA FIGURES, VASES, FOUNTAINS, &c. Manufactured by DOULTON and WATTS, Lambeth Pottery, High-street, Lambeth, London.

D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, the superiority of which over Artificial Stone or Cement is well known. It is subjected to a high degree of fire, which renders it imperishable, and gives it a sharpness and surface which no changes of temperature can impair.

D. and W. are enabled to offer the Terra Cotta at a considerable reduction in price; and Drawings and Designs will be forwarded Gratis, on application.—Architectural work executed.

HEALTH, LONG LIFE, AND HAPPINESS.—EXTRAORDINARY CURE OF SCORBUTIC HUMOUR.

I, William Wood, of Rockwell Green, in the parish of Wellington, Somerset, hereby certify, that for about *seven years* I was afflicted with Scorbutic Humour on my nose, with a continued discharge, rendering me almost unfit for society; I tried several medical men, and various medicines for curing the same, but all proved of no avail, producing no beneficial effect; at last I was persuaded to try Parr's Pills, and after taking two small boxes and part of a third, I was completely cured, and I now feel no pain or inconvenience as before. Many parties in the neighbourhood, and your Agent for Wellington, Mr. Greedy, can bear witness that my testimony is correct, and I wish it to be made known, that others similarly afflicted may be encouraged to try the same medicine, which under the blessing of God has proved so serviceable to me.

Witness my hand this 6th day of August, 1844. Wm. Wood.
In the presence of John Greedy, Wellington.

From Dr. C. Steane, 184, Fulton-street, sole agent for Brooklyn.—An instance of the singular efficacy of Parr's Life Pills, which merits particular notice, occurred in the person of a lady, residing at Brooklyn, of consumptive make, who had been afflicted for upwards of six years with very great and general debility, headache, flatulence, faintings, and all the effects originating in an impaired constitution. Country air was tried, but to little advantage. She complained of weariness and pain on the least motion: her bowels were sometimes constipated, and at others lax, and never regular. At this period, she was recommended to try Parr's Life Pills, when no less astonishing than true, before she had finished two boxes, an entire and perfect cure was the result. To such, nothing can equal this antidote, as it imparts tone and strength to the stomach, and operates so mildly, that the most delicate of either sex can take them with the greatest safety.

To T. Roberts and Co., April, 1844. Yours truly, C. Steane.

These, and hundreds of other cases of DECIDED CURES, attested on the highest authority, and already published, occupy upwards of 150 pages of letterpress. These Testimonials are published periodically, and may be had on application at any respectable medicine-vender's. The cures, in many instances, were effected after all other means had failed, and they thus establish the claims of PARR'S LIFE PILLS, in being considered the best medicine in the world.

CAUTION TO THE PUBLIC.—Beware of Spurious Imitations of the above medicine. None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE Letters on a RED GROUND, engraved in the Government Stamp pasted round each box. Sold by all respectable Medicine Venders.

WANTED, a trustworthy, steady, industrious married Man, without children, able to look after a Kitchen-Garden, a few acres of Land, Cow, and Horse, and to take care of a Cottage when the family is absent.—Address, with full particulars of last situation, age, wages expected, references, &c., to Z. A., at Messrs. Dawson and Son's, 74, Cannon-st., City.

WANT PLACES.—All Letters to be post-paid.

AS NURSERY FOREMAN.—A single Man, who has a general knowledge of the business; he has a good address, and can be highly recommended.—Direct to R. A. S., at Mr. Gray's, George-street, Foley-place, London.

AS GARDENER.—A single Man, aged 24, who is practically conversant with the routine of forcing, kitchen, fruit, and flower-gardening; can have an unexceptionable character from the family he has now left.—Direct to W. Wood and Son, Maresfield, near Uckfield, Sussex.

AS GARDENER.—A married Man, aged 28, who perfectly understands his business in all its branches; the Vinery and all kinds of Forcing, Fruit, Kitchen, and Flower Garden; is a native of North Britain; can be well recommended by the lady he has lately left.—Direct to A. B., Pierce Egan, jun. Stationer &c. 2 A, Grove Terrace, Queen's-road, Bayswater.

AS GARDENER, OR GARDENER AND BAILIFF.—A respectable married Man, aged 45, who has a scientific knowledge of his profession, and extensive experience in early forcing of every description, as well as a practical knowledge of Agricultural pursuits as practised in the principal Agricultural districts of Scotland, which would render him a valuable acquisition to any gentleman requiring a person in whom he could place dependence; he has lived 8 years in his present situation, and can have an unexceptionable character for ability, civility, sobriety, and attention.—Direct to A.B.C., Mrs. Russell, gardener, Turnham-green.

AS GARDENER.—A single Man, 33 years of age, who perfectly understands his business in all its branches, and can have a good character from the place he is about to leave; would have no objection to a small farm, if required.—Direct to Wm. James, Gardener, Capt. Kimmes, Croham Hurst, Croydon, Surrey.

AS LAND STEWARD.—W. FIFE, who has lived as Land Steward with the Rev. F. S. Trench, at Kilmorony, for the last seven years, where he had the entire management of an extensive farm, will shortly be disengaged, and ready to treat with any Nobleman or Gentleman who may require a Steward who thoroughly understands Agriculture, as practised in the most improved districts of Scotland, where he has had the management of several large farms; and who has been accustomed to the buying and selling, rearing and general management of Stock, reclaiming of waste land, &c. The Advertiser is a native of Scotland, 36 years of age, and unmarried.—Direct, William Fife, Kilmorony, Athy, Ireland.

AS WOODMAN, PLANTER, & GAMEKEEPER.—A middle-aged married Man, who has for near six years filled a similar situation, in one of the first families in Devonshire, would be glad to meet with one of the same description; he can have a first-rate reference from his present employer, whose service he leaves early in November. — Direct to Mr. Alexander Pontey, Plymouth Nursery, Plymouth.

AS PROPAGATOR.—A married Man, aged 28, who has a practical knowledge of his business, and can give satisfactory references for character and ability.—Direct to A. P., Messrs. Whitley and Osborn, Nursery and Seedsmen, Fulham.

A YOUNG MAN, who has been brought up to the Business, is desirous to meet with a situation to attend to a Seedshop and Nursery. Respectable reference and security can be given.—Direct to A.B., at the Office of this Paper.

THOMAS JACKSON, Kingston Nursery, Surrey, Oct. 18.

GERANIUMS AT VERY LOW PRICES.

WM. E. RENDLE, having a large stock of the following sorts of GERANIUMS, is enabled to offer them at very low rates.

*** A dozen will be forwarded on receipt of a Post-office order, including hamper, package, and carriage free to the Exeter terminus of the Great Western Railway.

CLASS 1.—30*s*. per dozen, including package, carriage, &c.—Conflagration, Pulchellum, Jersey Maid, Lady Villiers, Fascination, Diomede (Rendle), Symmetry, Thunderer, Dido, Cordelia, Oberon, Favourite, Prince of Waterloo, Jessie, Count D'Orsay, Lord Ebrington, Constellation, Lavinia, Cornish Gem, Attila, DUKE OF CORNWALL, and SUNRISE.

CLASS 2.—20*s*. per dozen, including package, carriage, &c.—Evelina, Gipsey, Witch, Hamlet, Cynthia, Aurora, Creole, Lady Cotton Sheppard, Countess of Mount Edgcumbe, Fair Maid of Devon, Wonder of the West, Portia, Jupiter, Life-guardsman, King John, Sultan, and Princess Royal (Lyne).

CLASS 3.—15*s*. per dozen, including package, carriage, &c.—Camea, Consort, Van Amburgh, Enchantress, Glory of the West, Ivanhoe, Flash, Queen of the Fairies, Grand Monarch, Amethyst, Wildfire, Mabel, Prince Albert, Nymph, Bridegroom, and Sybil.

All the plants are strong, healthy, and well established, and will be forwarded immediately on receipt of order.

Union Road Nursery, Plymouth, Oct. 17, 1844.

HERTFORD NURSERIES.

E. P. FRANCIS begs respectfully to inform the Nobility, Ladies, and Gentry, that his descriptive CATALOGUE OF ROSES is now ready for delivery, and will be forwarded gratis upon application, and which comprises upwards of a thousand varieties.

E. P. F. takes this opportunity of stating that he has made an addition of several acres of land, and that his Nurseries now extend over 25 acres of ground, containing a large stock of Fruit and Forest Trees, which are in fine and healthy condition; a fine assortment of Trained Trees, Evergreens, and flowering Shrubs, all of which may be had upon the most reasonable terms. Catalogues may be obtained with Prices attached. Carriage of all goods paid to London.

LOUIS VAN HOUTTE, NURSERYMAN TO THE KING OF BELGIUM, begs to inform the Trade and Public in general, that the Parts 17, 18, 19, and 20 of his General Catalogue are now published, and may be obtained on application to Mr. G. RAHN, Crescent, Minories, London.

L. V. H. would willingly take ORCHIDÆ in exchange, to any amount, on the party proposing such an exchange, giving him a correct statement of the price and strength of the Orchidæ required.

NOTE.—All letters to Belgium must be prepaid.

THE TRUE FASTOLFF RASPBERRY.

YOUELL AND CO. beg to announce they will again be able to supply fine canes of the above truly excellent variety, unequalled for the size of its Fruit and richness of flavour; prices as follow:—

Packages containing 100 Canes	.	£2	0 0
Ditto " 50 "	.	1	1 0
Ditto " 25 "	.	0	12 0

Further particulars will appear in future Advertisements.

YOUELL and Co. feel it due to themselves to state that a spurious kind was offered for sale by other parties last season, under the title of "Fastolff Raspberry," the same having no pretensions to the genuine variety.

☞ For Particulars of their EXTENSIVE and SELECT COLLECTION OF CARNATIONS, PICOTEES, PINKS, Finest Imported DUTCH HYACINTHS, &c. see their Advertisement of last week.

Great Yarmouth Nursery, Oct. 17, 1844.

TULIPS, CAMELLIAS, &c.—A gentleman wishes to dispose of his stock of Tulips, amongst which are Pompe Funebre, Polyphemus, Albion, Louis XVI., Claudiana, Cerise blanche, and other choice sorts. Any one wishing to add to their stock, or commencing the culture of these flowers, will find this a favourable opportunity. A mahogany Tulip Cabinet, with Drawers for 100 rows, some separate Drawers, a frame with awnings, &c., complete, are also to be disposed of. Also, a few Camellias, well furnished with blooming buds, Geraniums, and other Greenhouse Plants. Apply between the hours of 2 and 6, at Brackly Cottage, Hill-street, Peckham.

SPLENDID NEW GERANIUM—BECK'S "ZAMZUMMIM."

LUCOMBE, PINCE, and Co., possess the Entire Stock of this very celebrated Geranium, raised by Mr. Beck, of Isleworth; it has been much admired wherever it has been exhibited, and was awarded the First Prize for Seedlings at the Exhibition of the Royal Botanic Society, Regent's Park, on the 24th of May, 1843. It also obtained a Certificate of Merit from the London Horticultural Society, on the 13th of May, 1843. It will give satisfaction to all who purchase it, and is indispensable in all first-rate Collections.

L., P., and Co., are now prepared to execute orders for it with strong Plants at 21*s*. each. A full description of this superb flower will be met with in their Catalogue of New Geraniums, just published, which may be had on application to them, Exeter Nursery.

HODGE'S "GENERAL TOM THUMB" PINK.

SAMUEL HODGES begs to inform the admirers of the Pink that he is sending out Strong Plants, at 5*s*. per pair, of the above-named unique variety, the guard leaf being broad and flat, with a perfect smooth edge, and narrow purple lacing, as regular as if drawn with a pencil, and beautifully crowned. The undermentioned can supply plants:—

Messrs. HURST & MCMULLEN, 6, Leadenhall Street, London. Mr. WILLMER, Florist, Sunbury. Mr. KEYNES, Florist, Salisbury. Mr. LODGE, Florist, Manchester.

S. H. has also good plants of Pinks, of Hodges' Gem, Melone, Mars, Pluto, Cyrus, Orion, Invincible, Devonia, Clio, Enchantress, Jupiter, Climax, with a great variety by other growers, at 1*s*. per pair.—Imperial Nursery, Cheltenham, October 17.

CHAPMAN'S KIDNEY POTATO.—Messrs. C. and T. CHAPMAN, of Brentford End, are ready to execute orders for their POTATO at 10*s*. per bushel; any person desirous of seeing the quality and the yield can do so by applying to Mr. T. CHAPMAN, Sion Hill, Brentford End, when instructions for their preservation and culture will be given.—Oct. 18.

MR. HOYLE'S NEW SEEDLING GERANIUMS.

MR. MILLER will commence sending out the above CHOICE PLANTS on the 23d inst. Printed Lists, with full descriptions, may be had on application.

Providence Nursery, Ramsgate, Oct. 15.

TRAINED PEACHES AND NECTARINES.

WM. E. RENDLE respectfully informs the Nursery Trade that he has this season a large stock of TRAINED PEACHES AND NECTARINES, strong, healthy, and in excellent condition.—Union-road Nursery, Plymouth, Oct. 17, 1844.

A SPLENDID NEW LATE PEACH.

MORTON'S "WALBERTON ADMIRABLE."—This splendid variety was raised at Walberton House, in Sussex, the seat of R. Prime, Esq. It is a Seedling from the Noblesse, which it much resembles, both in size and colour. It possesses all the fine qualities of its parent, but its great merit arises from its ripening full five weeks later. A specimen of its fruit was sent to Dr. LINDLEY in 1841, from whom were received the highest testimonials of approbation. The tree is a fine, free, and hardy grower; the fruit is full-sized, melting, and excellent-flavoured, rendering it a truly desirable variety, and one which no good garden ought to be without. Good one year's trained plants can be obtained of ALEXANDER WEBB, Nurseryman, Westergate, near Arundel, Sussex; at Messrs. HAY, ANDERSON, and SANGSTER'S, Newington Butts; and also at Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street, London, at 10*s*. 6*d*. each; a few strong plants at 15*s*. each. The usual allowance to the Trade when three or more are taken, and carriage paid to London. Remittance from unknown correspondents is required.

HOLLYHOCKS.

WM. JACKSON AND CO., in directing attention to those magnificent plants, beg to state that this and the following months are the best for their removal, and they will now commence sending out their unrivalled collection, which have been so much admired this season, and obtained the first and second Prizes at the North Riding Horticultural and Floricultural Society's Show, held at Northallerton, in Sept. last. Early orders will be carefully attended to, and the plants well packed.— 100 fine plants for 35*s*., or 50 do. for 20*s*.
12 do. extra, very fine show varieties, 21*s*.

Cross-lanes Nursery Office, Bedale, Yorks., Oct. 14.

TO THE PLANTERS OF ENGLAND.—TRUE HIGHLAND PINE.

JAMES GRIGOR, NURSERYMAN, Norwich, begs to remind such of the Planters of England as are anxious to enhance the beauty and value of their estates that he is now sending out plants of this recently introduced and very desirable timber-tree, at the undermentioned prices:—

Single plants, strong and well rooted	.	6*d*. each.
Strong plants, 20 inches high	.	5*s*. per 100.
Do. 18 "	.	30*s*. per 1000.
Smaller-sized plants	.	from 10*s*. to 20*s*. "

For introducing this tree Messrs. GRIGOR, of Elgin and Forres, were awarded several premiums by the Highland and Agricultural Society of Scotland, where it is rapidly superseding the common Pine. In its old age it assumes in a great measure the darksome grandeur of the Cedar of Lebanon, and is therefore invaluable for planting in masses throughout the more prominent parts of distant landscapes. Sir Walter Scott describes it as presenting much of "the bold and contorted figure of the Oak;" and the *Quarterly Review* recommends it as an acquisition to churchyards and cemeteries. It is highly esteemed for all economical purposes, on account of the hardness and durability of its wood.

N.B.—J. G. has for the present disposed of all his potted plants; but as the others have excellent roots, there is no risk in removing them. A supply in pots will be ready in the course of next month.

CEDRUS DEODARA, raised from seeds in the open ground, 10*s*. each. Araucaria imbricata, Pinus excelsa, &c. &c. on reasonable terms.

WARREN'S GARDEN and NURSERY, Nonantum Vale, Brighton, Floral Saloon and Seed Store, No. 1, Tremont Temple (late Tremont Theatre), Boston.

The Proprietor of this Establishment is now ready to receive and execute orders for Fruit, Ornamental Trees, Grape Vines, Shrubbery, Roses, Strawberry Plants, &c., in any quantity, and of the most valuable kinds, at short notice, properly packed and secured for transportation to any part of the United States, Provinces, or Europe.

The Catalogue for 1844, which has been prepared with scrupulous care, contains a list of the choicest sorts of Pears, Apples, Plums, Cherries, Peaches, Apricots, and Nectarines, Grape Vines, Raspberries, Gooseberries, Strawberries, Currants, Evergreen Trees and Shrubs, Ornamental Trees, Herbaceous Plants, Roses, Greenhouse Plants, Dahlias, &c.

A new feature has been added in the Catalogue, which renders it particularly valuable for purchasers who are desirous of improving their orchards and grounds, by planting only the most approved, superior, and productive varieties. It is by columns and abbreviations, the meaning of which is explained under every different kind of fruit, so that a large number of the most important characters by which the different varieties are distinguished may be seen at a glance.

While the List of Fruits may not be found so extensive as in some other Catalogues, it contains every kind of value, and all new and improved varieties are added as soon as their qualities are tested. Nevertheless, any variety that may be ordered can always be supplied, on as reasonable terms as are afforded at other Nurseries.

The List of DAHLIAS comprises upwards of 300 of the choicest varieties of this gorgeous and splendid flower, most of them prize varieties. Dry Roots ready for delivery early in the Spring, and in Pots from the middle of April to the 1st of June.

STRAWBERRIES, of the most productive and best varieties, for sale, in any quantity. None but healthy and strong Plants will be suffered to leave the Nursery.

GRAFTS and SCIONS of most of the kinds named in the Catalogue, can be obtained in their season.

GREENHOUSE PLANTS of all the rare and splendid kinds always on hand at the Saloon, where visitors are respectfully invited to call.

GRAPE VINES, ASPARAGUS, and other roots constantly for sale.

Also, a great variety of choice GARDEN and FLOWER SEEDS, all of this year's growth, and warranted fresh, genuine, and true to their names.

Agricultural, Horticultural, and Botanical Books.

Gardening Implements, Flower Vases, &c. &c. The whole enumerated in a new descriptive Catalogue, which will be given Gratis on application. All orders for trees will be delivered at one day's notice. Every tree and plant will be warranted by the subscriber as to its distinctive character and goodness.

JAMES L. L. F. WARREN.

GEO. MILLS offers Five Seeds of his best Early Frame CUCUMBER for 2*s*. 6*d*. His Treatise on their Culture, with Plan of Pit, is published, at 113, Fleet-street. G. M. will shortly publish, price 5*s*., his System of Cultivating the Pine-apple. Also, his Opinion of the Tank System.

Gunnersbury Park, Acton.

TULIPS, HYACINTHS, RANUNCULUSES, ANEMONES, GERANIUMS, AURICULAS, CARNATIONS, and LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment FLORIST TO HER MAJESTY, begs to recommend to the attention of the Nobility, Gentry, and Public his extensive assortment of the above Flowers, which, from the success he has had in their cultivation, he can offer at very moderate prices. He particularly wishes to call attention to the highly-flattering remarks on his Exhibitions of Tulips and Lilium lancifolium this season, in the various papers. He is also desirous of reminding the Nobility, Gentry, and Amateurs, who may wish to add to their collections or ornament their parterres with these beautiful flowers, that this is the best season to make a selection. The varieties of the splendid Lilium lancifolium are particularly adapted for parterres, as, besides being quite hardy, they flower at a time when the Nobility and Gentry are at their country seats, and when flowers are so much wanted. They only require to be known to be universally cultivated. Catalogues can be forwarded by post on application. Foreign orders executed.

NEW PROVIDENCE PINE PLANTS.

ON SALE.—100 good Succession of the above valuable sort, warranted free from White Scale and Mealy Bug. For particulars apply, prepaid, to JOHN BUTCHER, Nurseryman, Stratford-on-Avon.

NEW GERANIUMS.

LUCOMBE, PINCE & CO. respectfully inform the Public, that their Catalogue of New Geraniums is just published, and may be had on application to them; it will be found to contain many very splendid varieties, such as are quite indispensable in all good collections.—Exeter Nursery.

BAGSHOT NURSERY late HAMMOND'S.

GEORGE BAKER, late of Knap-hill, has to inform his Friends and the Public, that, under an agreement entered into in July last, he has become the tenant of the Bagshot Nursery Grounds, formerly for many years occupied by Mr. Henry Hammond. Mr. Baker is adding considerably to the stock, rendering it superior in quality and of greater variety than has hitherto been kept at this Nursery. All letters addressed to Mr. Baker, Bagshot Nursery, Surrey, will be punctually attended to.

CAMELLIA JAPONICA.

ROBERT LAWSON, Esq., of Tiverton, intends disposing of his stock of Camellias, which he has collected at much expense, and successfully cultivated for many years. They are in the highest state of health, and most abundantly set with blooming buds. Mr. L. disposes of them solely in consequence of their having become too large for his conservatory. They are as follow:—

			£	s.	d.
Reticulata,	from 7 to 8 feet in height, a very fine specimen, quite healthy and green	. . .	10	10	0
Imbricata,	from 7 to 8 feet in height,	do. .	8	8	0

Insignis	,, 6 to 7	,, very fine	2	10	0
Eclipse (Press's)	6 to 7	,, . . .	3	3	0

The Prices affixed are for the separate plants, of which not less than 8 can be taken together. If the whole are taken in one lot a considerable reduction will be made. Mr. Lawson will be happy to show them, or give any further particulars that may be required.—Tiverton, Oct. 18th, 1844.

NEW CARNATIONS, PICOTEES, AND PINKS.

MESSRS. N. and B. NORMAN'S CATALOGUE of SHOW VARIETIES can be had on prepaid application.—Bull Fields, Woolwich.

NEW PLANTS.

MESSRS. VEITCH AND SON have now ready for sending out the two undermentioned beautiful New Plants, viz.:—

Hindsia violacea. Strong plants at 63*s*. It is figured by Dr. Lindley, in the "Botanical Register" for August last, who there says—"The Hindsia violacea is one of the finest things obtained from South Brazil. It has been imported by Messrs. Veitch and Son, of Exeter, who received for it the Large Silver Medal at the Horticultural Society's Garden Exhibition in May last. It will doubtless prove a very easily cultivated Greenhouse Plant; and is certainly unsurpassed in beauty by blue-flowering shrubs."

Clitoria fulgens. Strong plants at 42*s*. This plant was exhibited at Chiswick, in May, under the name of Centrosema species, and received the Knightian Medal. See Report in *Gardeners' Chronicle* for May 25. It is figured in "Paxton's Magazine" for July last.

Messrs. V. and Son have also to offer the following fine plants, viz.:—

Achimenes picta
Allemanda grandiflora
Barbacena squamata Veitchia
Clerodendron lævifolium
,, splendens
Cyrtoceras reflexa
Echites atropurpurea
,, hirsuta
,, splendens
Gardenia Rothmannia
Gardenia Sherbourneæ
,, tetrasperma
Gesneria polyantha
Gloxinia Cartonii
Hindsia longifl ra
Inga pulcherrima
Luxemburgia ciliosa
Passiflora actinea
Pentas carnea
Thunbergia chrysops, &c. &c.

N.B.—Messrs. V. and Son's General Catalogue can be had on application.—Exeter, Oct. 18, 1844.

DOUBLE ROMAN and PAPER-WHITE NARCISSUS, 4*s*. per dozen. The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. Cobbett's, late Mr. Barron's, Italian and Foreign Warehouse, 18, Pall Mall. Also Dutch Hyacinths, Crocus, Tulips, Anemones, &c. &c. Price Catalogues of which may be had per Post.

THE GREATEST NOVELTY EVER OFFERED TO THE PUBLIC.

RHODODENDRON JACKSONII.—This splendid new hardy Rhododendron is confidently recommended as the most beautiful variety extant; it surpasses in the colours of its flowers the richest Geranium, and is quite a new feature in this noble family. It forces well, is a free bloomer, and of dwarf habit. A truss of flowers was transmitted to Dr. Lindley, who pronounced it "a very compact and handsome variety," with "great richness" in its general appearance, &c. See *Chronicle* of the 6th April last, page 216, "*Rhododendron.—C. L. N.*" To be sent out in March at 10*s*. 6*d*. each.

Wm. Jackson and Co. beg also to call the attention of the Nobility, Gentry, and the Trade to the following rare and valuable Rhododendrons, all warranted true, at the very low prices attached. The plants are from seed, fine and stout, twice transplanted, and ready to send out.

Rhododendron campanulatum, averaging 1 inch 3*l*. per 100.

Hybrids

Between R. campanulatum and the scarlet arborea, 2 in., 3*l*. p. 100
,, ,, and R. venustum, 1 inch . 2*l*. ,,
,, ,, ,, maximum . . 3*l*. ,,
,, ,, ,, nivaticum, 1 inch . 7*l*. 10*s*. ,,
,, ,, ,, Catawbiense, 1 inch 7*l*. 10*s*. ,,

Usual Discount to the Trade on the above.

Cineraria Celestial, No. 1, 2*s*. 6*d*. each; do. Fairy, No. 2, 2*s*. 6*d*. each; fine plants well established. See Dr. Lindley's opinion in the *Gardeners' Chronicle* of April 6th, page 216, under the letters "*C. L. N.*," and Advertisement of Aug. 24th.

Their new Catalogue is now ready (in which is a list of their fine white and scarlet Rhododendrons), and may be had on application. A remittance or reference will be expected from unknown correspondents.

Agents in London: Messrs. Whitley and Osborn, Fulham Nursery, who have seen the plants.

Cross Lanes Nursery, near Bedale, Yorkshire, Oct. 14.

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may be had at the Nursery, and of Messrs. Warner & Warner, Cornhill, London, after the 7th September.

DANECROFT NURSERY, STOWMARKET, SUFFOLK.—PETUNIAS, SEEDLING VERBENAS, DAHLIAS, &c.

S. GIRLING has much pleasure in announcing to his Friends and the Public generally, that he has been successful in adding to his already extensive collection of Verbenas some splendid Seedlings of the present year, which for colour, form, and size far surpass any Verbenas yet produced; in confirmation of which S. G. begs to refer the public to the following awards they have received, and reports that have been made of them, viz., an Extra Prize at the Ipswich Show in June, Stowmarket in July, Ipswich in September, Bury St. Edmunds, do., Stowmarket, do., and Chelmsford open Show; and favourably noticed by Dr. Lindley in the *Gardeners' Chronicle* and *Gazette* by Mr. Glenny, August 31, and in the *Gardeners' Gazette* by Mr. Glenny, August 31. Mr. Ayres also speaks of them in flattering terms in the *Gardeners' Chronicle*, Oct. 5, page 671; and in addition to the above testimonials they have been seen growing by many eminent Horticulturists and Amateurs, all of whom have considered them as very superior.

S. G. therefore offers them with full confidence of their giving general satisfaction.

	s.	d.
Alba Lutescens, sulphur-yellow, large, and sweet-scented	3	6
Alba Magna, the largest and best white out . . .	3	6
*Blanda, rosy-blush of excellent form . . .	3	6
*Gladiator, orange-scarlet, with deep yellow eye, fine	3	6
Lovely Rambler, grey-lilac, very large . . .	3	6
Messenger, bright-purple, of fine shape . . .	3	6
*Mulberry, bright-mulberry, quite new in colour and fine	3	6
Rose de Amour, bright-pink, with beautiful yellow eye, quite distinct, and the most attractive Verbena ever raised	5	0
*Rubescens, bright-ruby, large and well-formed . .	3	6
The Giant, silvery-lilac, the largest trussing Verbena known, some of the trusses measuring from 10 to 12 inches in circumference—the heads of this Verbena resemble in appearance a blue Hydrangea	5	0

N.B.—Those marked with an * will not be sent out till early in May; the others can be had after the 25th of October, and can be forwarded in tin boxes by post. The usual allowance to the Trade.

PETUNIAS.—S. Girling has likewise been successful in raising some Petunias of superior excellence. Twelve varieties, selected from about fifteen hundred seedlings, will be sent out as early as possible in the spring, far surpassing anything in that fine and beautiful class of plants. Nurserymen wishing to be appointed agents are requested to forward their names, which will be published in the *Chronicle* and *Gazette* before sending out. The usual allowance to the Trade. Advertisements with names and prices will shortly appear.

DAHLIAS.—S. Girling having purchased the entire stock of that beautiful Dahlia, Bourne's Marchioness of Ormond, the best light-tipped Dahlia of the season, similar but far superior to Bridesmaid in every respect, plants will be sent out early in May next, at 10*s* 6*d*. each. A few roots would be parted with, on the warranty of the party purchasing, for exportation only, and the party to whom sent giving a pledge not to send plants to England for sale. Nurserymen and dealers wishing to place this Dahlia in catalogue next season, will have their names published in good time before sending out, and the usual Trade allowance, where 12 Plants are ordered, and extra Plants to compensate for long carriage.

DAHLIA NONPAREIL.—S. G. has a few large and small ground roots of that beautiful and popular Dahlia to dispose of; the former at 30*s*., the latter at 20*s*. each. From the limited number sent out in England last season of this Dahlia, it will be more in demand than any other Dahlia sent out last May. Parties wishing for roots had better send their orders early, as the stock, which is limited, will be sent out in rotation, as the orders are received; almost every other kind of Dahlia in cultivation, embracing nearly all the favourite varieties of this and former years, can be had in dry roots at moderate prices, warranted correct to name.

N.B. A respectable reference or ready money will be required from unknown correspondents.

Foreign Orders faithfully executed.

Danecroft Nursery, Stowmarket, Suffolk, October 17, 1844.

"GENERAL TOM THUMB" SCARLET PELARGONIUM.

PHILIP CONWAY, Nurseryman & Florist, &c., Old Brompton, through the kindness of Mr. Ayres, is enabled to let out a few plants of the above, which is thus described in the *Gardeners' Chronicle*, page 550:—

"Unquestionably the finest dwarf Pelargonium out is that which has this season been exhibited under the name of 'General Tom Thumb.' It grows almost prostrate, is exceedingly rich and dense in foliage, and produces with the greatest profusion large trusses of the most dazzling scarlet flowers imaginable. I have a plant at this moment nine inches high and six feet in circumference, studded with 27 trusses of expanded bloom, and some of the trusses six inches in diameter; and on five plants there are upwards of 120 trusses of flowers."

For both pot cultivation and bedding out this plant is unequalled. Plants 3*s*. 6*d*. each, or 36*s*. per dozen, with the usual discount to the trade if six are taken at one time. N.B.—At the June Exhibition of the Regent's-park Society a prize was awarded to the above.

Frost's Superb, a splendid pot plant .	2*s*. 6*d*.
Mrs. Mayler, a very superior variety .	2 6
Cooperii dwarf, for bedding . .	1 6
Huntsman, do. . . .	1 6
Shrubland	1 to 21*s*.
Compactum	1 6
King	1 6
Queen	1 6
Conway's Giant Cactus, strong plants .	3 6 to 10*s*. 6*d*.
Veronica speciosa	3 6
Pelargonium Lanei, for forcing . .	1 0 to 3 6

Cash, with an order, is respectfully requested from unknown correspondents.

NEW ALONA CÆLESTIS.

J. J. BEST begs to return his best thanks to those numerous friends who have ordered the above plant, and begs to say he commenced sending out on the 16th inst. Plants of the above beautiful production, at 1 guinea per plant, may be obtained as under:—Messrs. Kollisson, Tooting; Mr. Jackson, Kingston; Mr. Ivery, Peckham, Nurserymen. Mr. Carter, Seedsman, 238, High Holborn. Usual discount allowed to the trade.—J. J. Best, Abbey Nursery, Reading, Berks.

J. THOMSON begs to inform the Cultivators of the PANSY he is now sending out strong Plants of his New Seedlings, including Pizarro and all the principal leading varieties in cultivation, at moderate prices.—Iver, Oct. 17, 1844.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l*. 8*s*. Garden-Lights made and glazed from 1*s*. per foot, at Jas. Watts's Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

HYACINTHS AND GREENHOUSE PLANTS.

HUMPHREYS'S SOLUBLE COMPOUND.—A few grains are effective. Half a Bottle dissolved in a quart of water furnishes a superior Liq id Guano at half the usual cost. Sold in bottles, price 1*s*. 9*d*. each, by Flanagan and Son, Mansion-house-street; Hurst and McMullen, Leadenhall-street, W. Clarke, Bishopsgate-within; Smith, Islington Nursery; Grimley and Co., Covent-Garden; Batt and Rutley, 412, Strand; William and John Noble, Fleet-street; Thomas Gibbs and Co., Piccadilly, Smith, Covent Garden; Charlwood, Tavistock-row; W. J. Nutting, 46, Cheapside; G. Lawrence, 18, Piccadilly; John Kernan, Great Russell-street, Covent Garden; Lockhart, 156, Cheapside; Shuttleworth, Pantheon; Minier, Adams, and Nash, 63, Strand; Thatcher and Son, Islington; J. Fryer, Clarendon-terrace, Camberwell; Thomas Ansell, Camden Town; Thomas Watkinson, Market-place, Manchester; T. S. King, Rochester; W. E. Rendle, Plymouth; Dicksons and Co., Edinburgh; Pontey, Leeds; Fisher, Holmes, and Co., Sheffield; P. Lawson and Son, Edinburgh; J. Thorne, Shepton Mallet; and other leading Seedsmen in town and country. Wholesale Agents, Davy, Mackmurdo and Co., 100, Upper Thames-street, London.

TO AMATEURS OF PLANTS, &c.

F. SEIBOLD is just arrived with a fine Collection of COLEOPTERA from Mexico, and some choice FERNS, to be had per 100; also some rare ZOOPHYTES, from the West Indies. A young German Naturalist is now going to the West Indies, Mexico, and Yucatan, on F. Seibold's account. He will take orders for Cacti, Orchidaceous, and other Plants, as also for Dry Specimens, Seeds, &c. &c. All orders must be given by the 25th inst.—270, High Holborn, Oct. 18, 1844.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, Architects, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally adopted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. Weeks and Day have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c. &c.

Sales by Auction.

SIX DAYS' SALE.—VALUABLE NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS beg to announce that the Sale of the celebrated Nursery Stock, at the American Nursery, Leytonstone (about one mile from the railway station, Stratford), will commence on Monday, 21st October, at 11 o'clock, and terminate on Saturday, Oct. 26.

EXTENSIVE SALE OF NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS beg to announce they have received instructions to sell by Auction, on the Premises, Windmill-lane, Camberwell, on Monday, 28th of October, 1844, and following days, at Eleven o'clock, a most valuable and varied collection of Hardy Trees, Shrubs, American Plants, Evergreens, blooming Camellias, Ericas, &c. Amongst the stock will be found some fine bearing Mulberries, and several hundred of fine straight young Plants of ditto. There are also fine Magnolias of sorts, strong Vines in pots, Climbing and other Roses, a first-rate collection of choice American Plants, and other valuable Shrubs, affording a most eligible opportunity for Nurserymen providing themselves with healthy stock. A portion of the American Plants, Shrubs, &c., will be lotted in varied collection to suit all customers. Catalogues may be had of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

ST. ALBAN'S, HERTS.

UNRESERVED SALE OF NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS are instructed by the Executors of the Mortgagee (in consequence of the Estate having been disposed of), to submit to public competition, on the premises, the Key Field Nursery, St. Alban's, on Monday, Nov. 18th, 1844, and following days, at 11 o'clock, the whole of the varied NURSERY STOCK, comprising Fruit and Forest-trees, Evergreens, Ornamental, Deciduous, and American Plants of every variety, and about 3000 Standard and Dwarf Roses, consisting of the choicest varieties; 1,000,000 Quick and Oaks, of different ages; Seedling Beech, Ash, &c., Sea Kale, Asparagus, and Rhubarb, Dahlias, and Herbaceous Plants. The lots will be arranged to suit large and small purchasers. May be viewed one week prior to the Sale. Catalogues 6*d*. each, returnable to purchasers, may be had on the premises, of A. A. Dorant, Auctioneer and Land Surveyor, St. Alban's; of the principal Seedsmen in London, and of the Auctioneers, Leytonstone, Essex.

AMERICAN NURSERY, KING'S ROAD, CHELSEA.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, and Others.

MR. KIRKE will sell by Auction, on the Premises (late the American Nursery), King's-road, Chelsea, on Wednesday, October 30, 1844, and following day, at Eleven for Twelve o'clock each day), by order of the Proprietor, the ground being required for other purposes, the VALUABLE COLLECTION, comprising several thousand Aucuba japonicas, Laurels, Laurestinus, Hollies, Box common and Siberian, Lilacs, Roses, Poplars, fine standard Mulberries, Yews, a quantity of large ornamental Flowering Shrubs and Evergreens, Yuccas, Orange and Lemon-trees, Greenhouse Plants, &c. &c. (arranged in large and small lots, to suit the convenience of purchasers), and Greenhouses. May be viewed two days prior to the sale. Catalogues had on the premises; of Messrs. Gaines, Seedsmen, Covent Garden; Messrs. T. and C. Lockhart, Seedsmen, Cheapside, City; and at the Offices of the Auctioneer, 29, Brompton-row, Brompton.

SPLENDID NEW GERANIUM—THURTELL'S "OTHELLO."

THIS very distinct and superb variety was raised by Capt. THURTELL, R.N., Devonport, and is allowed by all who have seen it to be the greatest novelty that has been produced in Geraniums, possessing a new character, altogether unlike any other sort, which at once arrests the eye, and fixes attention upon it in the midst of all the finest modern varieties; it cannot fail to give satisfaction to all who buy it. The shape is perfect, and the habit excellent.

A full description of this and other first-rate Seedlings raised by that celebrated cultivator, which have been exhibited at the principal Horticultural Shows this summer, and cut blooms of which obtained an extra prize at the Exhibition of the Royal Botanic Society, Regent's Park, on the 2d July, 1844, will be found in their Catalogue of New Geraniums, just published by LUCOMBE, PINCE, and Co., who possess the entire stock of all Capt. THURTELL's flowers, and are now ready to execute orders with fine strong plants at very moderate prices.—Exeter Nursery.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 19, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

SATURDAY,	Oct. 26	Royal Botanic . . .	4 P.M.
FRIDAY,	Nov. 1	Botanical	8 P.M.

WHAT is required WHEN CUTTINGS OF PLANTS ARE TO BE STRUCK, is a due adjustment of heat, light, and moisture. The first stimulates the vital process, the second causes the formation of matter out of which roots and leaves are to be organised, the third is at once a vehicle for the food required by the cutting, and a part of it. The great difficulty is to know how to adjust these agents.

If the heat is too high, organs are formed faster than they can be solidified; if too low, decay comes on before the reproductive forces can be put in action. When light is too powerful, the fluid contents of the cutting are lost faster than they can be supplied; when too feeble, there is not a sufficiently quick formation of organisable matter to construct the new roots and leaves with. If water is deficient, the cutting is starved; if over-abundant, it rots.

It is, then, the adjustment of these varying forces to the peculiar nature of the cutting to be acted upon that constitutes the art of propagation. It is this which theory cannot supply, but which depends upon skill and experience. If any part of the operations of cultivation can be called empirical, it is this. And yet the operator is not without rules to guide him in this adjustment; the misfortune is, that they are too general.

The softer a cutting, the quicker must be the excitement and application of the formative process, the more the light, the smaller the quantity of water. The more hard and woody a cutting, the slower will be the operation, the more feeble the light, the greater the quantity of water. If these conditions of new growth can but be preserved, all cuttings of all plants may be converted into new individuals.

The great enemies of the propagator, says Mr. Neumann, are rotting and drying; for this reason cuttings are preserved in the midst of a temperature and humidity always equal, the evaporation of the soil is hindered, and the perspiration of the cuttings is prevented.

Heat, light, and moisture being thus shown to be the agents to whose assistance we must look for success, and by whose mismanagement the hopes of the gardener are ruined, it is of the first importance to determine how each can be best and most efficiently controlled.

And first of heat.

We know that plants are distributed over all parts of the habitable globe; that in neighbouring countries the species are nearly alike, that distant countries are clothed with vegetation of entirely different kinds, and that the distinction in the vegetation is in proportion to the distance of the countries from each other. There is not, perhaps, a dozen species in Normandy that do not grow wild on this side the Channel; there is not a dozen species common to England and Bengal. Species, in fact, are in general limited by similarity of temperature, and cannot exist beyond such limits. One of the first considerations for the propagator, therefore, is what amount of heat is natural to a species during its season of growth. With less than that it is hopeless to make cuttings grow. It is only when plants strike freely that the natural amount of heat is sufficient; in general they require more. The amount of heat found in their natural climate may be enough for them to grow in; but a greater degree of excitement, by means of a higher temperature, will be demanded by them to strike root in, when cut up into the fragments called cuttings. A Willow-cutting stuck into the open ground will strike root, but it does so much faster and more vigorously if placed in a hotbed. A Whitethorn cutting in the open ground will not root at all; in a warm propagating house, it will do so readily; and, to reverse the illustration, cuttings of tropical plants, which naturally enjoy a very high temperature, will perish if it is reduced, and will only put forth roots when it is raised considerably above their natural standard. Thus Mr. Neumann mentions that Nutmegs, Guaiacum, Mangoes, &c., will not succeed unless in a temperature of about 100° Fah. That degree of heat, again, would be fatal to greenhouse plants.

But it is not the temperature of the atmosphere that requires to be maintained above that to which plants are naturally subject: it is the soil that must be warmed. The first object is to obtain roots; those organs once formed, leaves will follow. The vital action which causes the production of roots is, in the first instance, local; roots are produced by the development of the cellular matter of the underground part; that cellular matter requires to be stimulated by unusual warmth; but the necessary stimulus cannot be communicated by a heated atmosphere: it is the warmth of the soil in which the cellular matter lies buried that must be secured. Unusual warmth of the air would have the effect of stimulating the buds, and would cause a premature appearance of leaves, which would be anything rather than conducive to the success of a cutting. If soil were to be kept at 33°, and the air at 84°, leaves would form, but no roots would be emitted under ground, however skilful the operator; and then, unless roots were thrown out above ground, the cuttings would speedily exhaust themselves. On the other hand, if the soil were kept at 84°, and the air at 33°, leaves would certainly be formed as soon as the roots had struck out, although in a pinched and shivering condition.

A proper degree of *bottom-heat*, then, is the first point for consideration, for all other processes are subservient to that fundamental requisite; and the rule is, that it should always be higher by several degrees than that to which plants are naturally subject. Unfortunately we have very little evidence to show what that is; but a rough estimate of it may be formed by regarding it to equal the mean temperature of the summer: hence the great value of good meteorological observations to gardeners. Suppose, for example, that it is required to strike a cutting of some plant from Algiers, and that the mean temperature of the summer there were 70°—which is, we believe, about the truth—the safe course for the gardener to take would be, to plunge his cutting in soil warmed up to 75°.

It is very much to be regretted that no one should have as yet compiled a set of meteorological tables for the use of gardeners. They would be invaluable; and we live in hope that some public body will, ere long, take up the subject. Scattered through books, there is a vast quantity of evidence which, although imperfect, is of great value, but nobody knows where to look for it when it is wanted. If such a work were once compiled, evidence would quickly accumulate, for inquirers would learn what to observe. With that evidence, gardening would assume more and more the condition of a science; for there is no doubt that a correct knowledge of the heat, light, and moisture of different climates is, next after the laws of vegetable physiology, the surest guide to successful cultivation.

The action of light and heat we shall consider on the next occasion.

Now that Providence has blessed us with an ACORN HARVEST of unexampled abundance, do not let us throw away the advantage. The value of these nuts for pig-feeding, and for deer or poultry, is well known; but we doubt whether, in their natural state, they are anything like so nutritious as they would be with a little preparation. We know that Barley is greatly improved by being malted; because the starch which it contains is by that process converted into sugar. Why should we not treat Acorns in the same way? They, too, are full of starch, and if malted would exchange it for sugar.

All that it would be necessary to do is to moisten the Acorns, gather them into a large heap in an outhouse, and throw mats or sacks over them. In a short time they would heat, and begin to grow. As soon as the young root is an inch long the malting would be effected, and might be stopped by simply spreading the Acorns out to dry again.

We believe this has been done already to some profit; and at any rate it is quite worth the experiment, especially for cottagers, for whose pigs Acorns are always in such request. It costs nothing, and cannot do harm.

As the season for PLANTING TULIPS is rapidly approaching, we hasten to lay before our readers the translation of a work published by a first-rate Parisian cultivator. Our Tulip-growing friends will thus have an opportunity of seeing how far our neighbours on the Continent agree with us in the cultivation of this beautiful flower, and at the same time they possibly may meet with some information which may be of service in the future management of their beds, &c. We have made a close translation of that part of the work which describes the formation of the beds, planting, &c.; and where the Continental practice differs from ours, we shall give our own opinions as we proceed.

For the bed, "an open situation," says the writer, "is chosen, facing, if possible, the south-east or south-west, and at least 15 or 20 feet from any walls. The soil is then excavated, forming a cavity about 17 yards long, 18 inches deep on one side and 14 on the other, and 3½ feet in breadth.

"It may then be filled in September or October with a friable substantial maiden loam, which has been previously passed through a coarse sieve. The bed must be raised two inches above the surface on the side where the bed is 18 inches deep, and 6 inches on the opposite side, where it is 14, thus forming an inclined plane.

"By this means the florist can see at a glance his whole collection, and without confusion inspect them individually. There is also another advantage gained by giving the bed a gentle slope: drenching heavy rain can easily flow off, which otherwise might stagnate, and by soddening the ground cause serious damage to the bulbs."

Here we may observe that the usual method in England is to form the bed highest in the centre, so that in a bed of seven rows of flowers, which is the number generally adopted, the fourth or middle row is the tallest, and the others decrease in height on both sides, the first, or the row next the path, being shortest. By this arrangement, we obtain an equally good view of each side of the bed.

We do not, however, admire the plan of sifting or screening the soil composing the bed, as we are confident that bulbs do better in maiden loam, well beaten with a spade, in which the decayed turf is retained, than in earth or compost which has been passed through a sieve.

"If a second bed is formed," says our author, "care must be taken to make it parallel with the first, and exactly of the same dimensions. It should be separated from it by a path four feet wide, and its slope ought to be in the opposite direction, that is, the two beds ought to incline one towards the other to produce a more beautiful effect. In order to supply the requisite nutriment for the support of the bulbs, which when grown for a length of time in the same soil become foul and degenerate, the person who during fifteen years has had the whole management of my Tulips, changes the soil composing the beds every two years; and to obtain as fine a bloom the second season as the first, he spreads in July or August a quantity of night-soil, in a semi-liquid state, so as to completely saturate the beds; after a month has elapsed, he mixes it well together, either by passing it through a sieve or screen, or by turning it over with a spade, even to the bottom of the bed, so that the whole may be equally enriched with this most excellent manure. If night-soil is not easily procured, well-rotten cow-manure, in the proportion of one-eighth, may be added to the soil composing the bed."

Thus far, then, we have situation, the earth most proper for, and the form of the beds, with the manure usually employed on the Continent.

We consider cow-manure, in a thoroughly decomposed state, to be highly beneficial in the composition of a Tulip bed, and from experience we can say, that some of the finest blooms we ever had were when a thick layer of cow-dung formed the sub-stratum.

As for night-soil, we do not imagine that it is often used in the manner above alluded to, although we have seen its good effects on Ranunculuses, by being spread over the bed when it was dug, in autumn, and washed in by the heavy rains usual at that period. Where fresh maiden loam cannot be procured, this might be tried, as we are sure that confidence may be placed in our author's experience. —*W.*

PRUNING FOREST-TREES.

Inutilesque falce ramos amputans.—HORACE.
With pruning-knife the useless branch he cuts.

I HAVE lately seen a long Article in the *Gardeners' Chronicle*, signed "W. Billington," containing some strictures on the management of my woods in the neighbourhood of Nerquis; and in support of those opinions the writer refers to a work entitled "Facts and Hints," published by him some twenty years ago. I think he estimates too highly the interest created by that work, in supposing not only that every one read it at the time, but that it made such an impression on the readers as to be still remembered. In his present letter, however, the hints may have been repeated—facts seem to have been forgotten. Mr. Billington's principles, reduced to few words, seem to be that the tree is supported from the atmosphere, through the leaves and branches, rather than from the soil, through the agency of the roots—a theory certainly very acceptable to the owners of barren mountain soil, had it anything to support it but the assertion of the writer. I do not feel disposed to deny that a tree with numerous healthy branches and leaves will increase in girth, more than one that has but few leaves, and them diseased. Here has been a confusion of cause and effect, and leaves the question untouched, Whether a wholesome discipline in removing a redundancy of branches may not tend to the improvement of the tree? I do not deny that leaves are necessary to the

well-being of a tree, and probably are to them what the lungs are to the human system; and every farmer is aware that plants with large and full leaves do not exhaust the soil in the same proportion as roots which have smaller leaves; but I cannot conceive that any one will deny that the various branches which Mr. Billington would so carefully preserve, must appropriate to themselves a certain portion of sap which would otherwise go to the nourishment of the parent stem. Why is it recommended to head down a tree that has been transplanted, but to keep down the sap within narrower limits? for the roots, from their recent removal, do not at once so fully perform their functions, and thus furnish but a feeble supply; and if the process of heading has not been adopted, for the first few years the topmost boughs seem dead; but as the roots begin to feed upon the earth, the vegetation becomes more vigorous, and at length the sap has been driven into the extremities, exhibiting in this process a convincing proof of the fallacy of Mr. Billington's theory—that it is by the descending sap that the tree is nourished. Mr. Billington likens the leaves to members, and the branches to families, and therefore the more they are multiplied, the more the nation, which he supposes to be represented by the trunk, will be enriched. I accept his premises to overthrow his conclusion; for, who ever thought a nation's welfare was increased by the merely multiplying the population, without providing means for their support? There seems something analogous in the human frame; by amputating a limb, we generally find that the patient becomes stouter. Mr. Billington then asserts that removing branches on their first appearance is calculated to make the tree puny, and he would wait till they are of larger growth. I should conceive the very reverse. As well might the practitioner delay the removal of an excrescence from the human body, until all its parts had become perfect through which it had drawn its nourishment. I had reserved a specimen, where the knife had never been applied, where all its natural tendencies had been uncorrected, for the edification of Billingtonian visitors, but I regret that it had died before Mr. Billington's inspection—I suppose with shame at its own uncouth structure; for when contrasted with its neighbours it exhibited the appearance of a deformed dwarf, beside a company of well set up grenadiers. Another point in which I differ from Mr. Billington in his mode of pruning:—He would foreshorten the branch which he intends to remove, instead of cutting it off close to the trunk, and thus making a second attack two or three years after; by this I apprehend he causes a greater wound, in consequence of the enlargement of the member to be removed, and creates a knot in the timber when eventually cut down. I do not think Mr. Billington is very certain as to his own mode of operation, or the extent to which it should be carried; for he speaks of encouraging branches, or removing them when necessary; it would have been more in character with one professing to teach, to have told us when that necessity existed. Mr. Billington then takes Mr. J. Scott Russell, an eminent engineer, to task, and questions the fairness of his comparing the trees at Nerquis with those growing in the neighbourhood, but under different treatment; but, with singular inconsistency, proceeds to compare them with the woods of other proprietors, planted in totally different localities, and, it may be, in totally different soils. The public, however, will judge which offered the fairest test. The concluding paragraph of Mr. Billington's letter leaves me in some doubt as to what his real views are; for, having throughout declaimed against pruning, he adds, "I protest against the non-pruning advocates;" and winds up by saying, "It is clear that we may regulate by skill and art the increase of the girth and elongation of the trunk to almost any proportion we please." This is precisely the object I have in view; and, to meet the crude and unsupported opinions of Mr. Billington, I would invite any unprejudiced person, capable of judging, to visit the plantations in question; and in the mean time, having received some very flattering testimonies to their management, from scientific and practical men, I can, with perfect good humour, submit to the condemnatory remarks of Mr. Billington.—*W. M. Thackeray, M.D., Chester.*

ENTOMOLOGY.

Anisoplia horticola—(*called the May-bug and Bracken-clock.*)—This insect is so great a plague in two of its stages, and has been so very troublesome this year, that its history will be well worthy the attention of the cultivator. When the Roses are in full bloom in May, these beetles sometimes do very extensive mischief to the flowers, by eating out the anthers and consuming the petals. I have also observed them feeding upon the leaves of the Bramble and Eglantine, and remember that some years since a host of them passed over a friend's garden at Thetford, and completely destroyed all the Roses, "leaving only the fibres of the leaves; and on the flowers of those varieties that were in bloom, they hung like small swarms of bees; the previous year the crops of Apples and Nectarines were destroyed by them in the same neighbourhood,"* and the young Apple-trees are occasionally defoliated by them. At another time they were so abundant on the Acacias near Petersfield, as to consume the foliage, and when the trees were shaken, they fell down like a shower of hail. In the month of June they frequent Corn-fields and the surrounding hedges, about which they fly during the day, and enjoy the sunshine; they are seen also in Grass-fields, by roadsides, and the sea-shore, where they often lie dead at high-water mark in considerable numbers.

Having deposited about a hundred eggs in the earth, the female dies, and the larvæ hatch and commence their attacks upon the roots of the Grass. Bouché says they live also on the roots of different flowers in pots, as Saxifragas, Trollius, &c., which they gnaw off to the stem. It is, however, on lawns and pastures that these larvæ commit the greatest ravages; by consuming the roots the Grass dies, the dead turf becomes rotten, and sinks irregularly under the feet, owing to the burrows which the maggots had made in the earth; and the rooks and starlings add to the disorder by pulling up the turf to feed upon them. These maggots were in vast bodies in Sept. 1839 and 1840 in Hants and Gloucestershire; and I received many letters with specimens this autumn, complaining of their devastations. It is stated that they are feeding three years, and they reside about an inch beneath the turf; but as winter approaches, they retire deeper into the earth; and even in November, when frost has set in, they have buried themselves a spade deep. From their large and uniform size at this season, I expect they are generally full grown and prepared to enter the pupa state, for which purpose they form cells in the earth, and in all probability remain in that quiescent state until the following spring, when the beetles emerge about the time the Roses flower.

Linnæus named this beetle Scarabæus horticola; Fabricius included it in his genus Melolontha, and it now forms, with some others, a group called Anisoplia.† In Norfolk it bears the name of May-bug amongst the farmers, and with the trout-fishers in the Lakes of Cumberland it is designated the Bracken-clock. A. horticola (fig. 2), is a pretty shining beetle clothed with longish hairs, dark on the upper, and yellowish on the under side; the head, thorax, and scutel, are of a bright green, often with a violet tint; the head is thickly and roughly, and the thorax finely and more sparingly punctured; the 9-jointed antennæ (fig. 3), are ferruginous; the club and palpi are piceous; the elytra are bright fulvous, with seven distinct and several obscure irregularly punctured striæ; wings ample; the underside and legs are black, with a green shade, the anterior being the stoutest, the hinder the longest. The first pair of tibiæ are notched externally, forming two distinct teeth in the male; the others are spurred at the apex; the tarsi are 5-jointed; the claws are unequal, the internal one being broad and bifid in the two anterior pair. Fig. 4, a fore leg of the male; the line shows the natural length of the beetle.

The larvæ are rather active, and can walk tolerably well, dragging their bodies after them; they lie, however, generally curved up in the shape of a horse-shoe; the head is deep ochreous and destitute of eyes; the antennæ are very distinct, slender, and 5-jointed; the mandibles are somewhat rust-coloured, black at their tips; the body is ochreous-white, with a few brown hairs, the apex of a lead colour when the larva is feeding, but like the rest when the stomach is empty. It has 6 longish legs on the breast, clothed with bristly hairs; they are triarticulate, the third joint short; the claws are small and acuminated, with one or two bristles on the sides (fig. 1).

To kill these larvæ, water the Grass in the autumn with 1-10th gas liquor to 2-10ths water; it will do no mischief to the Grass, but will extirpate these miners. Where the gas-liquor cannot be obtained employ strong salt water. We should take advantage of mild weather in the spring to break up affected land, as at that time the larvæ are near the surface, and become an acceptable treat to the rooks, starlings, thrushes, blackbirds, robins, &c.; and even sparrows have been known to gorge themselves with these larvæ so that they were unable to fly. In the absence of such useful birds, pigs will be of service in reducing the brood of maggots; and where the Grass is only partially spotted, it is very beneficial to strew potash, unslaked lime, or other alkalies over the infested land before or after the winter season, which will restore the Grass to vigour, and, it is presumed, will destroy the grubs. Heavy rolling has also been successfully resorted to with a view of settling the undermined turf. If it be necessary to destroy the beetles, a cloth should be spread under the clustered branches previously to shaking them; and as this species flies in the day, this operation must be performed early in the morning, or in the evening.—*Ruricola.*

TRIP TO PARIS IN SEARCH OF AUTUMNAL ROSES.

Of the various floral improvements of modern times, nothing has probably produced such a beautiful change in the appearance of our gardens in autumn, or has been introduced with more striking effects, than the perpetual-flowering Roses. What can be more cheering at this season of the year than to behold the vivid colours of many of the Bourbon and Hybrid Perpetual Roses, contrasted with the more delicate tints of the Tea-scented set off by their dark-green foliage, now that autumn has set its seal on many of Nature's earlier productions? I am an ardent admirer of the Rose, and my enthusiasm has, ere now, carried me to the Continent in the sultry month of June, in search of new varieties. Having this year caught the autumnal mania, I resolved to delay my visit till September, in expectation of finding the perpetual-flowering Roses blooming in greater perfection. In this I was not disappointed, and would here advise connoisseurs of Roses, who are accustomed to visit the grounds of the large growers in England, to do so twice in the year—in June for summer varieties, and in September for the autumnal sorts. I feel assured they would be well recompensed by, and highly delighted with a September visit. The Rose gardens then assume altogether a new feature; the summer Roses are gone, and the autumnal kinds appear in all their richness and beauty. True, the autumnal Roses bloom in June, but they seem to require the long dewy nights to bring out their flowers in trueness of character, and the difference is oftentimes so great, that the well-known Rose of June would scarcely be recognised when blooming in September. Thinking, however, that many lovers of Roses might not have leisure or inclination to travel so far in search of one object, which, among a multiplicity of affairs, becomes of small importance, I will endeavour to give an account of what struck me as most remarkable during my late trip. After having visited the grounds of the Hertfordshire growers, and collected the choicest of Rosa's train there, I departed well pleased with what I had seen, and resolving to make further additions from foreign cultivators. Having reached the French capital, the first cultivator to whom I paid a visit was M. Laffay, the raiser of Madame Laffay, William Jesse, La Reine, and many other of our most beautiful Roses. I there saw Hybrid Perpetual La Reine in great beauty, and should pronounce it one of the gems of the season: the colour is pink, with a lilac hue, very glossy; the flowers are globular in shape, large, and very sweet. Another of his seedlings, Comtesse Duchâtel, is a Hybrid Perpetual of a superior kind. The flowers are of a rose-colour, with thick petals, closely set; Perpétuelle Indigo is a distinct variety, of a peculiar colour, to which its name relates; Hybrid Perpetual, Mrs. Cripps, a pale Rose, appears likely to become a profuse autumnal bloomer; Perpétuelle ponctuée, a bright Rose with white spots, is a very pretty variety. Of the four last mentioned, M. Laffay has, I believe, the entire stock at present, but intends selling plants of them this autumn. He has also a Moss Rose, Princesse Adelaide, of a pale rose-colour, blooming in corymbs, and said to be very handsome. The habits of the plants were certainly remarkable, having a degree of vigour quite foreign to the Moss tribe. Their season of flowering was past, but he said that the flowers were like those of Ornament de Parade, a well-known Gallica Rose; and other growers spoke well of it. Among others noticed here were Lady Alice Peel, Duchess of Sutherland, De Marx, Coquette de Bellevue, and Coquette de Montmorency—all Hybrid Perpetuals of recent introduction: the last-mentioned is in every respect a beautiful flower. M. Laffay is an enthusiastic cultivator of Roses, but a lover of fruits also.

To enumerate the various grounds visited would, I find, become tedious, and occupy too much space, having often looked through several in the course of a day. I must, therefore, arrange the varieties noted down as most remarkable, in their respective families.

Among the Perpetuals and Hybrid Perpetuals, were—Laurence de Montmorency, a free-flowering variety of a purplish rose-colour; Lady Elphinstone, rosy crimson, also a good autumn bloomer; Baronne Prevost, pale rose, sweet, and of an immense size; Comte d'Eu, a most beautiful carmine, but scarcely double enough, though apparently superior to Gloire de Rosaménes; La Bedoyére, a variety, of the character of Comte d'Eu, more double, and quite equal in colour; Marquisa Boccella, delicate flesh, a decided acquisition among a class of Roses the prevailing colours of which are purple and crimson; Prince de Galles, purplish crimson, a free grower, and seemingly well adapted for a pillar Rose.

Among the Bourbons were—Charles Souchet, purplish crimson, of a very pretty shape; Comte de Rambuteau, of the same cast; Delille, a dark rose, finely cupped; Duc de Chartres, pale red, and a most superb Rose; Dumont du Courset, bright carmine, sometimes curiously marbled; Edward Defosse, a bright pink, shaped like Madame Nerard, first rate; George Cuvier, pale rose; Glory of Paris, another crimson variety, marbled with violet, and a fine rose; Impératrice Joséphine, pale pink, of a very elegant shape, blooming in corymbs; La Grâcieuse, reddish crimson, a seedling from Emile Courtier, and an estimable variety; Le Grenadier, vivid crimson, frequently tinged with violet; Madame Suchet, rose and blush marbled, a delicate and beautiful variety; Princesse Clémentine, violet crimson, good; Princesse de Modena, flesh; Suchet, bright purplish crimson, very fine; Souvenir d'Anselume, a lively cherry colour; Souvenir de Dumont d'Urville, crimson, changing to violet after expanding, and Souvenir de la Malmaison, a magnificent flesh-coloured rose.

Among the Noisettes were—Mrs. Siddons, in the way of Le Pactole, but in its then state not superior; Similor, a yellowish buff, but in appearance a weak grower; and Chromatella, or Cloth of Gold, a Rose of yellow Noisette cast, of a paler yellow than I expected, and which does not appear to open too freely. It has, however, been an unfavourable season there for its flowering, and not being very plentiful, it may yet prove better than is anticipated.

Among the Tea-scented, I noticed Adam, rose; the flowers were bold and large, but not very abundantly pro-

* Curtis's Brit. Ent., fol. 526.

† Curtis's Brit. Ent., fol. and pl. 526.

duced; Barbot, yellow, tinted with rose, a very pleasing kind; Boutrand, rose; Comte de Paris, flesh, one of the finest Tea-scented Roses; Délices de Plantier, coppery rose, very rich-looking; Joséphine Malton, buffish yellow, of a beautiful form; Julie Mansais, sulphury white, the buds large and handsome; La Renommée, a whitish yellow, not new, but apparantly little known; Madame Roussel, white; Marie de Medicis, rose, with fawn centre, good and distinct; Moire, large full pale yellow, a superb Rose; and Safranot, a distinct and striking variety, of a beautiful saffron colour when first expanding, gradually melting off into buff. Some of these varieties I had previously seen in England, and in equal beauty of bloom; but others I there claimed acquaintanceship with tor the first time.

Roses in Pots were numerous, but there were none remarkable as specimens of superior cultivation; certainly none that I saw were equal to those exhibited at the Horticultural Exhibitions about London, by Messrs. Beck, Lane, Paul, and others; nor is it, perhaps, right to judge them by such a standard, as they were not grown to show what could be done with Roses in pots under good management, but merely as market plants. As such, the only objection to them by Englishmen would be the tall stems on which they were worked, and the little attention paid to their beauty. The head of the plant seemed to be considered the only part worthy of notice.—*W. Paul, Cheshunt.*

Home Correspondence.

The Plantation at Nerquis.—In reply to Mr. Billington's statement, (p. 651), I beg to say that there were four persons—one an artillery officer—present, besides myself, when Mr. Billington went through the plantations at Nerquis. Mr. B. was very anxious that we should adopt his theory of the growth of trees, and because we could not agree with him in his views, he was evidently displeased, and everything was wrong afterwards. I have lived with Dr. Thackeray for a period of more than 40 years. I have at all seasons of the year during that time employed many hands to assist me in fencing, planting, draining, thinning, and pruning, without any interruption, and yet Mr. B. says, "I perceived that some parts of the plantation had been long neglected before they had been thinned and pruned;" "and the greater part of the Larches are good, but they are not what they might have been under a better system." This I beg to contradict, as I as well as the persons whom I have had under me know that it is not the fact. Mr. B. further remarks that, "the Oak and Ash are not fine trees, and evidently show signs of having been injured by the Larches not having been sooner thinned out from among them, and also from having been pruned to excess: one object is however gained, viz., tall, straight, slender trees, without side branches to a certain height, and which are fit only for ladders, rails, poles, or such like purposes." Now I appeal to my neighbours, and to all who have examined these plantations, whether this is not an unfair statement of facts. Mr. B. brings before us a few well-grown trees, planted probably in good soils, and in a better climate, but I put in a claim for a large plantation thinned and pruned with the utmost care for 30 years, as well as for plantations which I planted 10 years before that time for Dr. Thackeray's stepson; and I must repeat that they are the admiration of all (with the exception of Mr. B.) who have examined them. When Mr. Billington was leaving the woods, Dr. T. begged he would take a knife and show us in what manner he would prune an Oak about 10 or 15 feet high, pointing out a tree of that size. This Oak had a leader and four competing branches. Mr. B. then foreshortened four of them within two inches of the stem, and said that in two or three years he should cut them off close in to the trunk. We immediately said, "Why not do the same thing at once, and throw the sap into the leader, instead of doing so when the branches are thicker?" Upon this he began to theorise, and whilst he was doing so I was desired to cut the same branches off quite close to the stem. I at the same time said that all the trees had been managed in the same way, and that, had they suffered from this plan, the plantations must have been a failure, and that he would have seen a wretched collection of trees instead of the beautiful ones that were to be found all around him. I was then desired to take off not less than three, nor more than five of the largest and most luxuriant branches we could see descending the tree. Probably, in the course of the summer, one or more of the side branches will either be removed or foreshortened, and, from 40 years' experience, I am confident with the best success—experience being the best instructor in the matter of quantity. About a fortnight ago there were in the woods at one time, a gentleman from Essex, one from Cambridge, one from London, one from Huntingdonshire, one from Norfolk, and two from Chester, who minutely inspected the woods, and expressed themselves highly gratified with all they saw, having, as they repeatedly said, never seen more flourishing trees in all their lives. Below is an extract from Pontey respecting pruning; the work is done once in three or five years only, which is very different from the mode which I have been instructed to follow, as may be seen by referring to Mr. J. Scott Russell's letter, and others which have appeared from time to time in the *Gardeners' Chronicle*. —Pontey says, (page 166), "Pruning not only improves the form but increases the size or general weight of a tree." Page 204—"If the first pruning took place when the plants were about 8 feet high, it might be necessary to displace two or at most three tiers of the lower branches; and two years further, two sets more of the same description; after which intervals of three years might elapse between the prunings; never displacing more than two tiers at once, except more should prove dead." Further—"It will be observed that this method of pruning is calculated to grow the trees with a long conic head; and hence they would have every possible benefit from the atmosphere which the space allotted them can admit."—*Thomas Roberts, Nerquis.*

Pruning Forest-trees.—Mr. Billington deserves the thanks of all who feel any interest in this subject, for the manner in which he has (I may say) set at rest the question of pruning, as relates to the far-famed Nerquis plantations. The results of his inspection are precisely what I had conceived, from reading the various descriptive notices that have from time to time appeared in your columns. Dr. Thackeray is to be highly commended for his attention to his plantations; but if that attention proceeds upon a mistaken principle, it is detrimental where it might be highly beneficial. It is really marvellous how, at this advanced period of experience and observation, any one can proceed and act on the principle, that depriving a tree of its branches adds to or accelerates the growth of its stem; and yet it turns out that this is the principle carried out, according to Mr. Billington, in the Nerquis plantations, which several of your correspondents invited me to visit, in order that I might, from actual inspection, be induced to recall the opinions I had advanced in your columns. I desire no better authority than that of Mr. Billington; and, according to his descriptive statement, Dr. Thackeray's practice is merely Pontey out-done. Mr. B., in conclusion, protests against the "non-pruning advocates." —Who are they?—So do I: yet I will venture to say, that proper thinning, with no pruning at all, is preferable to the system followed at Nerquis. I have all along avoided the physiological question, which I think quite unnecessary in arguing the utility or non-utility of pruning. The term "reciprocity," which I have used, between root and branches, comprehends the whole; and the greater the degree of it, the more solid wood will be laid annually on the stem: whether that wood be formed from ascending or descending sap, is practically of little consequence in the matter: the great point is to get it, and get it quickly, without saying anything about the *modus operandi*, which the authorities do not appear to have yet satisfactorily settled. The term "judicious pruning" is often used by your correspondents. Will any of them define it? How long is "judicious pruning" to continue? At what age of the trees is it to cease? Will Mr. Billington answer this, in reference to any of the plantations noticed in his last paper? It has occurred to me, that those who follow the severe pruning system(?) might save themselves some labour, by docking the roots a little. It would tend to preserve the equilibrium, and prevent the growth of useless wood, which only robs the stem.—*Quercus.*

Receipt for refreshing Raspberry and other Jams, long made.—Boil Blackberry juice till greatly reduced; add white sugar in the proportion of 1 lb. to a pint of juice; mix the old jam with this syrup, and boil until sufficiently done. By this means the colour as well as the flavour is restored.—*P. T. O.*

Strawberries.—Most parties are, I believe, agreed as to the good result of placing stones under the fruit-bearing branches of Strawberries. In dry seasons they keep the ground around the roots moist, and in wet seasons they preserve the fruit clean. Now, I would suggest that a simple tile might be made of the annexed form, which I think would answer well, look neat, and cost but little. Let them be made about 12 inches square, preserving room for the average size of the stems. After a season in preparing new beds, the runners might be placed at equal distances, so that the bed would be entirely covered when required by these tiles, which would lay thus. A bed of 40 feet by 6 would require but 500, and their cost ought to be but little, as they could be made by any brickmaker, being merely flat tiles and scooped out. Is the idea a good one, and had the tiles better be glazed? A little additional cost is of no moment.—*M. A. S.* [On no account glaze them. If you have round pebbles at command, why not pave the ground with them?]

Monstrous Grapes.—The reading in a late Paper an account of a monstrous berry of a Black Hamburgh Grape, lately produced at Stover, in Devonshire, has induced me to mention that in a vinery at Dorfold Hall, in Cheshire, there is on the same variety a bunch in which there are three of these monsters; the largest of them measures in circumference 5 inches, the second $4\frac{3}{4}$ inches, and the third $4\frac{1}{2}$ inches. The bunch itself probably weighs about 3 lbs.; there are several berries nearly as large in other bunches on the same Vine; they have very much the appearance of a Tomato —*A Constant Reader.*

Culture of Vines.—I imagine that it is not out of place my bringing light from another science to bear on gardening, to say, that the method of growing Vines proposed by Mr. Hoare is in my opinion somewhat objectionable, as they must of course have a very limited range in their search for food. It may be said, Make the column large and fill it frequently with manure; but if the column be broad, the heat will not be given as desired, and however often supplied with food, I should doubt the long life and vigorous health of a plant condemned to prison and solitary confinement: the roots will make constant efforts to gain liberty, and be repulsed; they will make search for food, and be driven back to the one spot: in that spot they will become thick, and the fibres dense; the soil around will be soon exhausted; and the new supply troublesome. If it be otherwise I shall be glad to know.—*A Reader.*—[This is assuming just that which nothing but experiment can show.]

Cabul Melons.—In reply to Mr. Fleming, (p. 684), I beg to say that, although I made a mistake respecting the name of the Melon which I advertised, it is the true one sent out by Mr. Fleming's permission, as the advertisement of Mr. White below will prove. In the *Chronicle* for Oct. 7, 1843, it is stated, "By the kindness of Mr. Fleming we are again able to supply a few more packets of the Hoosainee Persian Melon at 5*s.* per packet." Mr. Fleming is the only person who had cultivated the Melon to perfection up to the time that he sent it out, and I cannot see how it can disgrace his name.—*J. Cuthill, Camberwell.*

Raspberries.—I strongly recommend the Beehive Raspberry as a prolific bearer of large fruit, and most excellent. I have a second crop of the B. Raspberry at this moment, on the new wood, as fine as those of the abundant summer crop.—*D. B. Greys.* [What *is* the Beehive Raspberry?]

Large Yew-tree.—There is in the churchyard at the village of Gresford, Denbighshire, a Yew-tree, which measures 30 feet in girth at the height of 4 feet from the base. The branches are in themselves large trees, and shade the ground to a great extent. It must be of incalculable antiquity, and it is not yet in a state of much decay, though it has for centuries perhaps attained its maturity. Other Yew-trees, in the same place, which were planted (as the parish-register records) in the year 1727, are, on average, in girth somewhat more than 4 feet.—*E. C., Pantyocher, Gresford.*

Rose Catalogues.—The criticisms in the *Chronicle* lately, in reference to the dissimilar representations of the colours of Roses, are not wholly without cause; but perhaps, upon consideration, they may not seem so well merited as would appear at first sight. Rather than confine myself to the apparent error alluded to in my pamphlet on the Culture of Roses in Pots, I would take a general view of the subject; and in relation to the differential descriptions given by various growers, would hazard an opinion that the colours and appearance of Roses vary beyond degree. We believe that colours are deepened by the action of light, and numerous other circumstances also contribute in causing variations; for instance, the seasons—the different times of the seasons—the stage in which the flower is submitted for examination—the soil in which it has been grown—the health of the plant—and, above all, the different ideas of colours (without entering into the correctness or incorrectness of such ideas) maintained by different individuals. Now, with regard to the variation in the colours of Roses, see Indica Le Caméléon when just expanding—it is almost white. View the same flower a day or two afterwards—it is changed, and become a crimson! In fact, we may apply to Roses what the poet has written about a very different part of the creation:—

"'How slow its pace! and then its hue—
Whoever saw so fine a blue!'
'Hold there,' the other quick replies,
''Tis green—I saw it with these eyes.'
* * * * *
'Sirs,' cries the umpire, 'cease your pother,
The creature's neither one nor t'other.
I caught the animal last night,
And viewed it o'er by candle light.
I marked it well—'twas black as jet—
You stare—but, Sirs, I've got it yet,
And can produce it.'
* * * * *
"Replies the man, 'I'll turn him out:
And, when before your eyes I've set him,
If you don't find him black I'll eat him.'
He said; and full before their sight
Produced the beast, and lo! 'twas white!'"

Prince Albert (Hybrid Perpetual) occasionally blooms of a vivid crimson, and often of a cloudy purple. T. Safranot appears almost saffron-coloured, but dies off a poor buff. The first flowers I saw of Lady Alice Peel (Hybrid Perpetual), now two years ago, were pink, and as such I retain a vivid recollection of them, although I have never seen them of that colour since. I have just gathered a flower of Bourbon Augustine Lelieur, which measures fully four inches across; but the colour is so different, that, had I not gathered it myself, I should have had some difficulty in naming it. Without multiplying solitary instances, if we view the whole body of Roses that bloom twice in the year, and compare the colours noted down in summer with their real appearance at this season, we shall find a difference. But supposing Roses to bloom alike at all times and in all situations, some indulgence may be claimed from the public, where 800 or 1000 varieties are catalogued and described. Perhaps the first step towards attaining accuracy of description is, to take down the colours on the spot during the season of bloom. This, doubtless, is done, although requiring a sacrifice of time and labour from the principals, which an extensive Nursery business will scarcely admit of. But, again, the whole varieties cannot be found in bloom at any one time, and the collection would require a second, third, or even a fourth looking through, which would be incompatible with other duties. The probable consequence is, some few are described from memory. Now, although such descriptions may not be perfectly correct, may they not be considered sufficiently so to guide purchasers in selecting? which is the only purpose for which Nurserymen's Catalogues are published.—*W. Paul, Cheshunt, Herts.*

Couve Tronchuda.—This Cabbage seems a wild and

straggling grower, and occupies a great deal of room. It is recommended in the *Chronicle* as a delicious winter vegetable. At present it shows no heart. A little more information about the nature, culture, and growth of the Tronchuda would oblige—*B. D. Greys.* [Its leafstalks and heart are used like Seakale. It is tender, and is *not* a winter Cabbage.]

Bees' Eggs.—At p. 638, Mr. Pettigrew finds fault with my reply to "A Lover of Truth's" queries respecting bees' eggs. I expect, however, that some apiarian readers think otherwise, and see more reason to complain of his statement that "queen bees lay only one sort of eggs." I may state that I possess some working bees' cells containing the brood of small drones, or males, which clearly show there is a difference in bees' eggs, and also that no alteration takes place after the eggs are in the cells. Indeed, how could the latter be? Some say by royal jelly; but that cannot change the sex of bees.—*J. Wighton.*

Large Pine-apples.—In reply to an "Admirer of well-grown Pines," who asks Mr. Mills the following simple questions, viz.—What has been the probable quantity of dung used to bring the fruit to maturity? and the probable expense for labour in applying linings? I would state that every good gardener can tell the quantity of dung required to work a small five-light pit—and rotten dung is always valuable in a garden; and the labour for working such a pit is not worth noticing. I will venture to say, if an "Admirer of well-grown Pines" could produce at his employer's table a Pine of the enormous weight of 15 lbs. avoirdupoise, his employer would, in all probability, make no inquiry respecting the expense of dung or labour employed, but would be glad to know that his gardener had the merit of producing, for the first time in England, a Pine-apple weighing 15 lbs. I should have been proud to have been the grower of so noble a specimen, which could only have been obtained under the most skilful management, without which all the expense that could have been bestowed upon its growth would have been of no avail.—*W. Taylor, Streatham.*

Public Parks.—It must be gratifying to all who desire to see the comforts of the middle and working classes attended to, to know that a public park is about to be laid out in the neighbourhood of Manchester. It is unnecessary to dwell on the health-creating effect and moral influence that such a place of public resort will have upon the immense population of that town, as it is well known that where public places of this description have been opened to the community at large, the beneficial influences have been beyond all calculation. Public parks not only improve the moral character of individuals, but also lead to habits of industry, regularity, and taste. By the public prints it appears that 21,000*l.* have already been subscribed for this park; but in the expenditure of this sum, much will depend upon the judgment exercised in laying out the grounds, to secure the advantages which we ought to expect from a place of public resort in the neighbourhood of that large manufacturing district. I am aware that few places of this kind are properly upheld, unless they are arranged in a manner that will enable the directors to pay at least some part of the outlay. We may have liberal subscriptions for the original purchase of the ground, but unless some method is adopted by which the ground may be disposed of, so as to supply a fund for upholding the park in a proper condition, it will, like many other places of the kind, except those in the hands of Government, fall to the ground. Public parks have recently been laid out near Liverpool, and in the improving neighbourhood of Birkenhead. Both these parks have been judiciously arranged; the confines or outside borders are laid out in villa grounds, which it is supposed will be sold for more than the original purchase of the ground, while the interior of the park is devoted to the healthy exercise and recreation of the public. It would be well to impress upon the attention of the managers of the proposed Manchester park, that some such arrangement as that just adverted to should be adopted. If it were laid out in such a way that one-third of the ground was disposed of for villa residences, I have no doubt but that, under proper arrangement and management, the ground so disposed of would not only pay ultimately for the original purchase, but would uphold the park in proper condition. It is not only a serious matter, but one that requires the greatest judgment on the part of the managers of this affair, to secure the services of those who are well qualified to advise and arrange a matter intended to benefit succeeding generations. I hope, therefore, that the directors will not lose sight of an arrangement which may enable them to have funds to uphold in strict order and regularity a park worthy of their justly celebrated town.—*A Friend to Public Parks.*

Bokhara Clover—Noticed in a former Number of the *Chronicle*, I find a failure; the great drought of the summer may have caused this. It can hardly be said to have blossomed here. I purchased the seed as recommended, in order that my bees might feed on its flowers. It is a coarse large sort of Clover, and grows 3 or 4 feet in height.—*B. D. Greys.*

Irish Yew, &c.—It may be useful to state that I have raised many seedlings from the Irish Yew; some are three years old, but all evidently are the common Yew; and this may save others the trouble and time necessary for their development. The fine season has been the means of the double-flowering Peach and Pyrus spectabilis producing fruit—the latter in unusual abundance, which, when frosted, is nearly equal to the Medlar in flavour; and the birds—good epicures certainly—prefer them to all the other fruits in the nursery.—*W. G.*

Extirpation of Mice.—Your correspondent "Nemo," who inquires how best he may destroy the mice with which he is annoyed, is recommended by one who is an old practitioner to proceed as follows:—In the first place, let him arrange his canaries (which at present must be greatly disturbed by the mice getting into their dwellings at night) on the walls of his room, so that they may hang in even rows; under each row of cages, and nailed close to the wall, let a well-planed and neatly-painted half-inch deal shelf be erected, sufficiently wide to project several inches beyond the line of cages, and let it extend the whole length of the room. It will be all the better if a beading or ledge run along the front of each shelf. By this provision, the greater part of the seed, so unsparingly scattered about by the birds, will be prevented falling on the ground, and so, the temptation offered to the mice, who are greedily fond of canary and rape-seed, will be infinitely lessened. The next step will be to reduce the number of mice, for where there is bird-seed there are sure to be mice: this is easy. Procure a few pennyworths of nux vomica in powder, and, with a small portion of it, mix thoroughly some bruised canary-seed and crushed Wheat; place this in a saucer in a corner of the room, and close to it a second saucer filled with cold water; then, just before retiring to bed, sweep the floor carefully, and remove the seeds, husks, &c., that may have fallen from the cages. This will prove a night of terror, for death will make sad havoc among the birds' enemies. Next morning let "Nemo," after collecting the dead and the dying, and burying them, nail flat pieces of zinc or tin over every mouse-hole he can find. This will prevent any effluvium that might arise a few days afterwards from the decomposed bodies under ground. The remaining mice, their suspicions being awakened, will now troop off. Should they at a future period return, let the former dose be repeated at bedtime, and the result will prove equally satisfactory as before. If a cat's services be required, let her be domesticated when quite a kitten: then, by the aid of a slight switch as a corrector, a positive familiarity may be created between Grimalkin and the birds—the latter exhibiting pleasure rather than fear when the former is present. Where cats are inmates, poison must not be used; for if a mouse be poisoned, and a cat afterwards eats it, her death too frequently follows. Some of my neighbours, have, I understand, been recently placing poison in their grounds for the destruction of rats; the consequence has been the ascertained death of eleven fine (and several of them very favourite) cats. This is to be regretted, and no person will suffer more from it than myself. Though I have a large collection of birds, the only weapon I bring to bear upon their sworn enemies, the cats, is a legitimate one, viz., a long whip, which is artistically laid on, *in terrorem*, as occasion serves. As "Nemo" has between 30 and 40 canaries, I would suggest to him whether, in such a case, it would not be advisable to appropriate one room, with a door at either end, to their entire use. All vermin would be thereby excluded.—*W. Kidd, New-road, Hammersmith.*

Societies.

BOTANICAL SOCIETY OF LONDON.

Oct. 4.—J. Reynolds, Esq., Treasurer, in the chair. Various donations were announced. Read—A General Description of the Botany, Climate, and Physical Geography of the Neighbourhood of Embleton, in Northumberland; drawn up by Robert Embleton, Esq., in illustration of a Local Herbarium of the District, collected for the Society by the same gentleman. The Description and Herbarium will remain at the Society as a valuable record of the present condition of the district.

ENTOMOLOGICAL SOCIETY.

Oct. 7, 1844.—Geo. Newport, Esq., President, in the Chair. A specimen of Tortrix rutilana was exhibited by Mr. Bedell—an insect new to the British Fauna.—Mr. Westwood exhibited a specimen of Lenopalpus striatus, taken in Leicestershire by Mr. Plant. Several new Coleoptera, taken in Chili, were exhibited by Mr. Canning.—Mr. Raddon sent for exhibition living larvæ from Potatoes and Turnips, which had this year been very destructive in his neighbourhood. Mr. Westwood stated that they were the larvæ of some species of Noctuidæ, probably an Agrotis. There was no other way of getting rid of these animals but by hand-picking.—The President laid upon the table a number of specimens of Lepidoptera, in which the legs had been reproduced after having been broken off. The reproduced legs were none of them of the size of the old legs. The legs were broken off during the larva state of the animal.—Several specimens of insects were exhibited from Captain Boys, sent from India; they were prepared in a peculiar way by placing the whole insect between very thin plates of talc.—A new Pausus-like insect was sent by Dr. Cantor—the Trochoideus amphora. It attacks the leaves of the Cocoa-nut trees, of which it is very destructive. Dr. Cantor also forwarded some notes on the habits of Arachnida.—Some notes upon an orthopterous insect, a grasshopper, which had the power of swimming on the water, were read, from Captain Boys. The Secretary observed that he believed this was the first instance on record of an orthopterous insect with aquatic habits. The President referred to the butterflies whose legs had been reproduced. At a recent meeting of the Society this subject had been discussed, and it had been supposed that reproduction would not take place in insects in which true metamorphosis took place, but this was set at rest by the result of his experiments. Although the legs and claws were always reproduced, the armature of the insect never was. The reproductive power of the insect depended much on the weather, as in moist, damp weather he found the wounds would not heal.—Mr. Harry Goodsir exhibited drawings of the condition of the parts in the reproduced legs of a species of Crustacea—the Cancer pagurus. The reproduction in these animals was effected by means of a gland. This gland was surrounded by a series of vessels which also accompanied the reproductive germs in the ovaries of the animal.—Dr. Lankester pointed out the importance of studying this subject in a morphological point of view. The reproductive cell of all organisation possessed common characters, which once obtained, we should find an easy expression for the countless variety of secondary forms which it exhibited.

REGENT'S-PARK GARDENERS' SOCIETY.

The adjourned meeting for the discussion of Morphology (see page 639) took place on Tuesday evening, Oct. 8. Mr. Reith, the chairman, directed the attention of the meeting to specimens of Rhododendron and Camellia, which, after having formed and set their blossom buds, had produced leafy shoots from the same buds, in consequence of being improperly excited. He considered these as illustrations of the necessity of setting such plants out of doors in summer, to mature their annual growth.—Mr. C. Moore read some paragraphs from an article in the "Magazine of Botany," opposed to Morphology, which he characterised as being evasive of the true question. He then referred to specimens of Cryptogramma crispum, in which the fertile fronds are evidently a changed state of the barren ones, thus proving that the production of seeds on the leaves, as in Ferns generally, was in no way opposed to the doctrine. Allium scorodoprasum was next referred to, in a specimen of which the flower-stem at its summit bore perfect seeds, in the ordinary seed-vessels, seated on little pedicels, and bulbs springing into leaf at the base of these pedicels, and there attached to the stem.—Mr. O'Neill asked what was really meant to be established by Morphology, as apparently opposed to the established order of vegetation?—Mr. Maher said that Morphology, which strictly meant a "discourse on form," taught us to believe that all the parts of plants are originally alike, being produced by the vital action from the same original tissue, and, consequently, that any part of a plant, before it was developed, would have admitted of a different kind of development under the influence of exterior circumstances. He said that buds, and bulbs, and seeds, the several offspring of the stem, the root, and the flower, were identical both in nature and office, as containing the vital embryo, and capable, when detached, of reproducing their kind. In the case of the Allium, the bulbs, being directly attached to the top of the stem, could not be confounded with the seed, which was produced at the extremity of a pedicel; and, that they were occasioned by some invisible impregnation before the development of the flowers took place, as had been assumed by some of the speakers, he designated as an idea wild in the extreme. He then took a summary glance of the progress of a plant. The root, when in its ordinary position beneath the surface, did not produce leaves, but little naked points of tissue, whose office was to absorb fluids; if the root were brought above ground, it would frequently produce leaves, and assume the character of the stem. In illustration of this, he mentioned a specimen of a seedling Potato plant in his possession, in which from the same point, near the surface, several runners were produced; some of these had been buried, and had produced both fibres and tubers; others had been exposed, and were leafy stems. The stem assumed many forms, and was different from the root, in being furnished with stomata, or breathing-pores; for, being exposed to the air, it had to perform the function of respiration, as well as of absorption. The leaves are composed of the same tissue as the stem, but developed in a peculiar manner for the elaboration of the sap; and they are furnished with stomata. Bracts are similar to leaves. In a specimen of Rhododendron, then before him, he said the true bracts, which should have been situated at the base of the bud, on a flat axis, were scattered along a leafy stem, exhibiting a gradual transition to a leaf, and in the axil of these bractescent leaves the flowers were produced, instead of assuming their natural character as a terminal cluster; the axis, too, was lengthened out, and would have formed a perfect leaf branch. The flowers that were produced were much altered from their usual character, but that they were flowers was plain, from their being coloured purple; and he could detect the filaments and stigma present.—Mr. Reid opposed the doctrine. In the case of roots, he mentioned that Bignonia radicans would produce shoots from the roots when covered. The case of a cone of the Larch producing a shoot from its apex, which had been laid before him, proved nothing; for the cone was filled with perfect seeds, in the usual manner, and these must have been the produce of flowers; therefore the shoot could not be a transformed flower. Viviparous Grasses, again, were simply illustrations of another means ordained in nature for the perpetuation of plants.—Mr. C. Moore said that he had observed the case of the Potato producing tubers and leafy stems from the same kind of runners, under different circumstances of exposure, and he thought this to be sufficient demonstration of the relation between roots and stems. The viviparous shoots produced on the Grasses were the result of a change in what should be the seed-bearing organs, the empalement being converted into leaves, instead of opening as a flower, and young plants being produced instead of seeds. In a subject comparatively new, and but little understood, it was most essential to do away with prejudice, or no satisfactory conclusion could be arrived at.—Mr. Fitzpatrick was not convinced by the series of articles in the *Gardeners' Chronicle.* The shoot of a Peach-tree,

produced from a leaf-bud, would, he said, produce flowers and fruit; but if there is no leaf at the extremity beyond the flower, both it and the shoot will perish; in this case, since flowers are said to be nothing but changed leaves, how is it that they do not elaborate the sap, and support the shoot? He had never seen proof that leaves performed the office of flowers, or the reverse. In viviparous Grasses, young plants are produced, but not flowers; and therefore the flowers not being present, cannot become changed into leaves. In the case of the Allium, as seed was present, there must have been flowers, but probably the young plants were originated from seed, which had ripened prematurely, and had fallen to the position the plants now occupied.—Mr. Townsend denied that fruit would not come to maturity without a leaf beyond it. He knew of a fine crop of Grapes, where the shoots had been stopped at the bunch: in this case there was no leaf beyond, but the progress of the fruit was satisfactory. He wished to know, however, at what time the leaves of such plants as Peach-trees and the autumn Crocus and Colchicum, were transformed, as in these plants the flowers seem to precede the leaves.—Mr. Ayres forwarded several interesting specimens in illustration of the subject.—*M.*

Reviews.

A Descriptive Catalogue of Selected Roses, cultivated for Sale. By Thomas Rivers, Sawbridgeworth, Herts. Supplement to the same for the Autumn of 1844, together 22 pages.—*A Descriptive Catalogue of a Selection of Roses cultivated for Sale.* By A. Paul and Son, Nurseries, Cheshunt. 19 pages.—*A Descriptive Catalogue of Roses grown for Sale.* By H. Lane and Son, Great Berkhampstead. 16 pages.

These Catalogues are indispensable to the Rose-grower, and contain among them all the information people in general can want, except habit or manner of growth, which is only mentioned occasionally. Mr. Rivers divides his Roses into summer and autumnal kinds, and then subdivides each of these heads according to their real or supposed races. Mr. Paul's classification is by races only, but he separates the Climbing Roses from the others. Mr. Lane carries the classification by seasons further than Mr. Rivers, for he has Roses blooming—1, in May, June, and July; 2, in June, July, and August; and 3, from June till November; and each of them he subdivides according to their races.

We will not repeat here our criticisms upon the spelling of the names in these Catalogues, but content ourselves with recommending growers to adopt the nomenclature in Mr. Rivers's list, which, although not perfect (for example, p. 4, Schornbrun for Schönbrunn, or Schoenbrunn), is much the best.

We extract Mr. Rivers's account of the Cloth of Gold, which has not yet come out in its beauty, except at the Bath Dahlia Show in September, where it was much admired; and the Prairie Roses, a new race of climbers, bred from R. rubifolia, an American trailing Briar, well suited for crossing, in order to obtain late-flowering kinds.

"*Cloth of Gold*, owing to an accident to the plant left for blooming, has not flowered here this season: I saw it, however, in the commencement of last June, at Angers, in great perfection: a strong plant against a wall had produced from four to five dozen of its splendid flowers; it had made vigorous shoots the preceding season, and every bud had produced its spike of flowers, the extreme outer petals of which were of a creamy sulphur, the inner a bright and beautiful yellow; its flowers were nearly or quite as large as our common Cabbage Rose. This variety will require a south wall in this country, and, like Noisette Lamarque, it must be established one year so as to produce some vigorous shoots; these the following season will give flowers from nearly every bud: these shoots must not, however, be shortened to any extent; four or six inches taken from the end of each will be quite sufficient. If it grows with extra vigour, so as to make shoots from twelve to fourteen feet in length, they must be trained in a serpentine form, or in any other mode, so as to avoid the necessity of shortening them. Like Lamarque, it will form a fine Standard, but like that it must either be removed to a north wall, as recommended for Standard Tea Roses in winter, or have its stem wound round with hay-bands, and its head protected with a prepared calico or other cap. Having introduced this Rose, I feel it my duty to give directions for its culture."

"*Prairie Roses.*—This is a new group of Climbing Roses, which promises to be of much interest. Mr. Samuel Feast, of Baltimore, U. S., has had the pleasure of raising the above-named varieties, from the seed of the single Michigan Rose, Rosa rubifolia; they are all of most robust and vigorous habits, making shoots in one season more than twelve feet in length. No. 3 is the most perfect and beautiful of the whole, giving clusters of flowers containing from twelve to twenty each; at first they are finely cupped; in a day or two they become imbricated, like those of the Duke of Devonshire. It seems to resist the hottest sunshine, and the flowers remain on the plant for a longer period than usual with any other Rose: in wet weather, however, they are not at all bright in colour, as was the case with some that bloomed the past summer; this has been named also Beauty of the Prairies. My name is that given to it by Mr. Feast. No. 2 only occasionally gives autumnal flowers. No. 1, owing to most of the imported plants dying, is more scarce than the other varieties. All these Roses are perfectly hardy; they will form fine Pillars and pendulous Standards."

NOTICES of NEW PLANTS WHICH are EITHER USEFUL OR ORNAMENTAL.

Epacris Autumnalis. Autumnal Epacris. *Greenhouse Shrub.* Epacridaceæ. Pentandria Monogynia.—This plant is inferior in interest to few of the charming species and varieties of Epacris with which we are acquainted. Its habit is that of a vigorous-growing shrub, combining with strength of stem all the elegance peculiar to the tribe, and producing richly-coloured flowers about an inch long. Unlike most of it's kindred, it commences blooming towards the end of October or beginning of November, and continues to flower through the winter till April. This feature, which is not the least interesting or useful, has suggested the specific name. It flowered in the Nursery of Mr. Low, of Clapton, in November last. Mr. Low obtained it from Mr. Cunningham, of Edinburgh. It is evidently of hybrid extraction. Although we are unable to state the exact source of the plant, yet we have seen others so similar in character at the Nursery of Messrs. Rollisson, Tooting, raised by Mr. Storey, of Isleworth, between E. impressa and E. grandiflora, that we can have little doubt of their common origin. In the management of this and all the stronger and more rapid growing Epacrises there is one point to which we desire to direct attention. It is the common practice to employ nothing but moor-soil and sand in potting, and it is to this, perhaps, more than to any other individual error, that the lack of success is attributable. If a portion of loam and well-decomposed leaves be incorporated with the heath-soil and sand, much more luxuriant shoots will be formed, and the quantity of flowers increased; for the soil, being of a more open and porous nature, will prevent the lodgment of stagnant water around the delicate roots, which so often, by destroying these organs, perils the very existence of the plant. Flowering in the winter season, at a time when solar light is at its minimum, it becomes more especially requisite to place them in an open part, where other shrubs may not shade them; if this be neglected, the flowers will be inferior in richness and intensity of colour. A liberal supply of water and a slight degree of shade will be needed whilst they are making their growth; and a perfect circulation of air must be maintained at all times.—*Paxton's Magazine of Botany.*

Miscelianeous.

Fastolff Raspberry.—We have just received from Messrs. Youell & Co. cut branches of this Raspberry loaded with fruit in its different stages of growth. The fruit was not quite so large as some of the same kind which was sent us in summer, but it was well-flavoured, and very fine for the period of the season.

The Blackbird.—It is grievous to think that this bird, whose melodious voice gives such pleasure to the ear, and lends a charm to the ramble through the grove, must, for the sake of a little fruit, meet with the usual persecution. Its food, in spring and early summer, consists of the larvæ of insects, with worms and snails. The enormous number of slugs and snails, so injurious to vegetation, which are eaten by blackbirds, should at least save him, on the score of gratitude, from the general destruction. Well may the poet say—

"Scare, if ye will, his timid wing away;
But, oh! let not the leaden, viewless shower,
Vollied from flashing tube, arrest his flight,
And fill his tuneful gaping bill with blood."

It were useless to prolong this list. In the utter ignorance that prevails of the benefits conferred by these beautiful creatures, with an equal ignorance of the food on which they subsist, it is hardly to be wondered at that many who venture into the gardens in search of insects, and other animals injurious to vegetation, alike fall victims to the indiscriminate slaughter vowed against every bird that approaches these precincts. In the little abode occupied by the writer, every encouragement is given to their presence. A neighbour once inquired how his lawn was so disfigured with worm-casts, whilst that of the writer's was so free? The answer was ready—"Leave off popping at the worm-feeders from morning to night, and your lawn will present an equally pleasant appearance." It is an agreeable sight in early morning to view the activity of the blackbird, thrush, starling, and others, vigorously tugging the struggling worm from his retreat, more especially if it should happen that the Grass is covered with dew. It is very true that some little fruit does fall to their share; but so grateful is their cheerful voice, and their interesting evolutions in search of food, deeply would the exchange be deplored that should deprive us of their presence for the sake of a little fruit, which in the hot season is, in all probability, as grateful to them as to the self-styled lords of the creation. And, last of all, let us remember that, as not "one sparrow is forgotten before God," it may well become us all to reflect whether, in the grand scheme of an All-wise Creator, these little creatures, sent undoubtedly for a beneficent purpose, although our imperfect knowledge may be unable to descry their immediate use, were not destined by Him to partake of some small portion of the abundance poured forth for the benefit of man.—*J. M.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

The old Bletia Tankervilliæ, as it was once called, is an excellent plant to force in winter, and should now be removed to the forcing-pit, where a brisk bottom-heat of from 80° to 90° can be kept up. Euphorbia jacquiniflora is unwilling to submit to much forcing at this time, but if it is checked now by being kept rather dry for a month or six weeks, it will flower a month earlier than its usual time. Old plants of Justicia speciosa and Eranthemum pulchellum always flower earlier than young ones—they should be ready for the conservatory at the same time with the early Chrysanthemums. The Hibiscus manihot makes a gaudy display through the autumn in the conservatory, and is best from seeds treated as an annual, like the Balsam; pieces of its roots potted now and placed on a shelf in the stove will make plants nearly as good as seedlings, and will flower two months sooner than seedlings, but older plants of it are more or less unsightly. Nematanthus longipes is a curious winter-flowering stove plant of the easiest culture, and well suited for the drawing-room or conservatory when in flower, as is also Centradenia rosea, which is a gem in its way; this also flowers in winter and early in the spring. Achimenes picta seeds freely, and no doubt will produce crosses; it is well worth having on that account, as well as for the beauty of its flowers and the singularity of its foliage.

Conservatory.—In answer to an inquiry, I beg to say that I have already in the Calendar stated all I know respecting the best conservatory climbers, with their names, treatment, &c. I imagine that the Mandevilla is as hardy as the Calampelis or Beerem cærulus scaber, if not as hardy as the common Passion-flower; for of frost has not affected its beautiful flowers in the least. The best way to insure the procuring of the true flowering Bignonia jasminoides, is to ask a nurseryman to send a plant that has the remains of the flowering truss on it; as they always flower in the smallest pots, there can be no difficulty in supplying plants in this state, and they are very cheap. Every effort should now be made to keep up the gaiety of this house, especially if it is attached to a sitting-room, as all good conservatories ought to be. The Chrysanthemums will soon be in: we cannot profitably force them; we can retard some of the late ones by placing them under a north wall: strong plants only should thus be treated, and rough sticks should be placed against the wall over them, to support mats, which should be put over them in cold frosty nights. The best Pelargoniums to flower in October are the Jewess, King Rufus, Madeline, Isidorianum, and Sidonia: each of these will stand hard forcing without injury, after these the Alba multiflora comes in. Pelargoniums with sweet-scented leaves are very useful for mixing in bouquets in winter, and some of them should now be forced: every place has its rose-scented variety, but the true rose-scented one is very scarce—it is the best of them all; next to it is Coronarium, an old one with a stiff erect habit and small curly leaves; and then, perhaps, Prince of Orange and Lady Flora Hastings are the next best. A large leaf of Fair Helen does well at the back of a bouquet, but it is too powerful and terebinthine for some people. Jasminum grandiflorum makes an excellent climber in the conservatory, but is seldom to be met with as such. J. stellatum, ligustrifolium, hirsutum, with the varieties of Sambac and some others, make good forcing plants for rooms, &c., for this purpose their climbing habits should be checked by under potting, and by pinching off the points of the shoots when the parts are young; they will then form bushy heads and flower more freely.

Pits, &c.—The forcing-pits should now be in full operation to keep up a stock of flowering plants for the rooms and conservatory through the winter. All hardy and half hardy plants brought in for forcing should have a temperature at first of from 50° to 60°, to be increased up to 75° when more advanced; but as many plants will not bear such heat, and others will not do much good without a high temperature, there should be two distinct pits or divisions at least for this purpose. In large establishments many plants are forced in the stoves and early vinery; but to allow the management of these houses to be altered in any degree to suit forced flowers is no economy. However, there are many things that may easily be forced in this way. With a large stock of Chinese Azaleas some of them may be had in flower from Christmas till the end of May; the first lot should now be brought to a heat of 50°, or even 60°, if they were well forced last April, and if their flower-buds are prominent. The double Roman Narcissus is the first of the forced bulbs, and where they have been potted early in August they will now stand 60° of heat, and will be in flower by the end of this month. Hyacinths, that have also been potted before the middle of August, will now endure a good heat, and bloom early, without at all injuring the bulbs; whereas late potted bulbs are ruined if forced early: not but that they will flower well enough, but the bulbs are of no use afterwards.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

If there is one thing more than another which contributes to the high keeping of this department of a gentleman's establishment, it is finely-kept and perfectly smooth *turf*. So fastidious am I in this particular, that the gayest flowers, let them be ever so well managed, would not please me, if the turf which surrounded them was in any way defective—in truth, it is impossible to produce a harmonious whole if the turf which surrounds the groups of flowers is not in every respect perfect; and for this reason, at this season I make it a rule to reinstate every foot of bad turf that can be found in any part of the grounds. This is unquestionably the best season to lay turf, except under large trees, and in such situations it is better to delay it until spring, or the constant dripping from the rains of winter would materially injure it. However, fine turf will not please if it is not level: smoothness, according to Burke, is a concomitant of beauty; and therefore, for a lawn to be beautiful, it must be level, smooth, and perfectly clean. And there is yet another essential element of high keeping which should be attended to, where necessary, at this season: and that is, the levelling and adjusting to one regular height the edgings which surround the walks and borders. These two things, combined with good walks, will give a garden a highly-finished appearance, even though there be not a flower in it; and in a neglected or badly managed one, will do more to improve it than any other thing that I am aware of. Let, therefore, those who wish to improve the appearance of their grounds attend to these suggestions: and if they are obliged to employ a few extra hands to execute the work, they will have the gratification of giving employment and improving their grounds at the same time.

Herbaceous borders may be now regulated, reducing the large plants considerably, and preferring rather to leave the outside than the centre of the plants. Where the plants have not been regulated for some years it will be best to take them all up, manure and trench the border, and replant them properly.—*W. P. A.*

IV.—PINERIES, VINERIES, &c.

Pineries.—In the management of the Pines intended for fruiting next season, it should be a principal aim to keep the roots in as equable a state of temperature and dryness as possible. Variations in either of these points are most injurious during the dull months of winter, when we are deprived of so much of the heat of the sun. Means should be taken to do away with the necessity of watering the roots of Pines in the winter season, and for this end nothing more is necessary than to cover the surface of the soil in the pots about two inches thick with leaves or tan, taken out of the body of a pit where they have heated and been partially decomposed. It will be found in the spring that the roots of plants so treated have suffered less if, indeed, they have suffered at all, than those which, owing to the surface being exposed to the air, have required water several times in the course of the winter.

Vineries.—Whenever a house is cleared of its crop it should be immediately put into working order again. The washing of the glass, making all necessary repairs, painting, and remedying defects, or making alterations in the heating apparatus, should all be done as soon as possible, not only that the house may look more creditable, and be in readiness for the next season, but also that decay may be prevented from spreading. All these matters should be conducted on the principle of the old proverb, "A stitch in time saves nine."

Peach-houses.—Wherever, owing to an over-luxuriant state of growth, the trees in the late houses are not ripening their wood well, they should be assisted by making slight fires during the day, when the weather is clear. When the leaves are all fallen, let the trees be pruned, washed, and trained, as recommended in former Calendars.

Strawberries.—It is now time to think of protecting Strawberries in pots and boxes from rain, and where there are many pots to be kept through the winter the following is a good way of storing them. Choosing a sheltered place, which, however, must be open to the south, drive in a line of stakes of convenient height and length, according to the number of plants to be stowed away, and in the direction of east and west. Nail some old boarding to these stakes, and then spread a layer of dry ashes, about three inches thick and 2½ feet in width, on the south side of the boards. On this lay a row of pots on their sides, with their bottoms towards the boards, and their rims

parallel with the outside of the layer of ashes. Fill in well between the pots, and also between the bottoms of the pots and the boards, with ashes. Then proceed with another layer of ashes, and then another row of pots, and so on till you come to the top of your boards, placing each row of pots a little nearer to the boards than the row below it, so that when finished the whole may present a sloping surface to the sun. The whole must then be covered with boards, in the form of a coping, of sufficient breadth to protect the lowest row of plants from slanting rains, and with a slight inclination to the back, so as to throw the rain off to the north side. If care is taken that the ashes be quite dry when put in, frost will have very little effect on the pots. This is a plan very similar to what is in use in many places, and one which we find to answer very well.

Errata.—In last week's Calendar, under "*Pineries*," line 7, for "The night temperature should not exceed 60°," read "The night temperature *for the young stock* should not exceed 60°;" and under "*Vineries*," line 9, for "If it was done last month," read, "If it was *not* done last month."—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Trees.—Pay every attention to getting the wood of Peaches and Apricots well-ripened, by exposure, shortening, &c. Prepare for planting all kinds of fruit trees, by getting the ground in good order and suitably prepared for the different kinds. The sooner the trees are planted the better, as they will then make fresh roots before winter. In all cases, but more especially on cold stiff soils, it is advisable to plant on hillocks, a foot or eighteen inches higher than the surrounding surface. The trees will not grow so fast in consequence, and will require more attention in summer for mulching, but they will form short-jointed, well ripened, fruitful wood, which is the best preventive of canker, gum, &c., and will save the labour of resorting much to root-pruning.

Roots.—No opportunity should now be lost for getting Potatoes, Parsnips, Carrots, Beet, &c. out of the ground, and stored up in a dry condition. Potatoes may either be kept in narrow pits, with a little dry earth sprinkled among them, or in airy dark sheds, according as it is desired, either to have them with the flavour and consistence of fresh lifted Potatoes, or in as dry and mealy a condition as possible.

Routine.—We have seldom had a better season for late Vegetables. Pull Cauliflower before it gets too large, and prepare a shed or pit to plant a quantity on the first approach of frost. French Beans are still doing well with a slight protection at night. Remove those growing in pots, where they can have the protection of glass; lay down strong growing Brocoli, so that the stems may be covered with earth; plant out Lettuces and Endive for spring use. If planted on the sloping sides of wide ridges they will stand better, damp being quite as destructive as frost. Take the precaution of securing a quantity either in pits or frames, or have the means of protection in readiness. Remove the leaves from Rhubarb and Seakale, that you intend forcing very early, and keep a look-out for slugs and weeds, both of which will be troublesome after these rains.—*R. F.*

VII.—COTTAGERS' GARDENS.

The beauty of most of the plants which enlivened the flower-border with gay blossoms in summer is now nearly over; all that remain to cheer us at this season are some late flowering Phloxes and the varieties of Chinese Chrysanthemum, which, in fine autumns like the present, are very ornamental, when tied up so as to show their flowers to advantage. Cut down the stems of all plants that have done blooming. The roots of Dahlias will survive moderately severe winters in the open ground, if protected by a covering of dry litter or Fern; but they do not flower so well, and on that account it is better to take them up as soon as their leaves and flowers have become blackened by frost. Leave about 6 or 8 inches of the stem attached to the tuber. They may be preserved over winter in any dry cool place where they will be free from frost. When the flower-border is dug and put in order for the winter, which should be done about this time, or as soon as the leaves have fallen from the trees, any plants that have become too large should be reduced, and such as are not wanted may be removed altogether. Let decaying leaves and other refuse be taken to the manure heap, which should be turned over occasionally, and covered in with soil: any drainings from it should not be allowed to be lost; they should either be thrown back over the heap or they should be made available for some useful purpose. As was recommended last week, as soon as the leaves are off fruit trees, and the ground sufficiently moistened, transplanting, where it is wanted, may be proceeded with. Advantage should be taken of dry weather for earthing up Celery. Late Pears and Apples should now all be got in without delay.—*J. M'H.*

State of the Weather near London for the week ending Oct. 17, 1844, as observed at the Horticultural Garden, Chiswick.

Oct.		Moon's Age.	Barometer. Max.	Min.	Thermometer. Max.	Min.	Mean.	Wind.	Rain.

The highest temperature during the above period occurred on the 21st, 1826—therm. 72°; and the lowest on the 21st, 1842—therm. 20°.

Notices to Correspondents.

Bees.—*E. B.*—We have given so much information about Bees in the early part of this year that we must refer you to former Numbers for the information you search for. If that is not sufficient for the purpose, you had better study some treatise on Bee management, such as Bevan "On the Honey-Bee."

Books.—*A. S.*—We are unacquainted with Whistlecraft's "Climate of England."——*F. T.*—Read De Candolle's "Physiologie Végétale," and either Endlicher or Schleiden's "Grundzüge der Botanik," or Adrien de Jussieu's "Cours de Botanique."——*H., A Young Gardener.*—Ingram's edition of Melrose, Lindley's "School Botany" to begin with, and then his "Elements of Botany."

Fruit-trees.—*J. P. W.*—In the present season a considerable number of both Apples and Pears have rotted on the trees before the period of maturity for gathering. The decay proceeded from the puncture of insects.‖

Gardenias.—*Sigma.*—These will live in a greenhouse, or even out of doors in summer; but to have them in good health and beauty you must give them a temperature of about 60° in winter and spring, until the flowers are forming; remove them then into the greenhouse, and they will remain in beauty during the greater part of the summer.‡

Heating.—*W. H.*—Our experience is not favourable to earthen pipes for hot water: the joints break and let out the water. Neither do we advise you to use any kind of porous hot-water apparatus for pits in which plants are merely to be wintered; they are all too damp. The cheapest mode of keeping out frost from such places is either to make the walls of earthen banks and to cover them with hurdles and straw, or to build a common smoke flue, which might be constructed with 5-inch circular chimney-pots. We have already given some hints about very cheap boilers, to which we must beg to refer you. Of earthen boilers we have no knowledge. Good mortar answers perfectly for jointing common smoke flues. You will see that several of your questions are unanswered, because we do not recommend hot-water gutters or porous pipes for your purpose.——*Vapor.*—If you are inconvenienced by the escape of offensive gas from your Arnott stove, the fault lies either in the construction of the stove, or your management of it. Coke is the best of all materials for such a contrivance, unless you can get Anthracite free from slates, which we can never do. Perhaps your draught is bad; perhaps the joints of your stove are open; perhaps twenty things, which nothing but experience and actual inspection can remedy. We have used an Arnott heated by coke, for some years, without any difficulty when we manage it ourselves.

Insects.—It is particularly requested that specimens of the insects, with the affected leaves, &c., as well as queries, may be sent to Mr. Curtis, without which he cannot undertake to return answers.——*D. L.*—If you will send us the insects attacking your Silver Firs, and, if possible, one or two small portions of the parts inhabited by them, we will answer your questions. *R.*——*A. Alves.*—Thanks for your data regarding the Cherry-slug caterpillar. The minute flies are a species of Barbarus (vide Curtis's "Brit. Ent.," fol. and pl. 469). Did you breed them from the Onion roots? The large caterpillar will change to the pale tussock moth, called Laria pudibunda. *R.*——*L. R.*—Your Pears appear to be affected by insects, but we could find none in either of them. Should you be able to detect any maggots in the fruit, and will forward them to us in a quill, we may be able to advise you regarding a remedy. *R.*——The scale insects infesting the Rafflesia are allied to the Coccus Hesperidum. If you will turn to an article upon those affecting the Orange-trees, at p. 427 of this Journal, you will gain the best information we can give you upon this tribe of pests. The other specimens are also female Cocci, and those which you took for ants' eggs are the ova of these scales, which are nearly related to the Coccus Vitis. If they appear in any numbers the twigs should be cut off and burnt. *R.*

Names of Fruits.—*J. P.*—1, Court of Wick; 2, Easter Pippin: 4, Beachamwell; 5, Blaudick's Nonpareil; 6, Fearn's Pippin; 7, Kirke's Lord Nelson; 9, Hollandbury; 10, Minchal Crab; 11, Gansel's Bergamot; 13, Crassane; 15, Napoléon.‖——*A Devonian.*—1, Belle et Bonne; 2, Uvedale's St. Germain; 3, Beurré de Capiaumont; 4, Glout Morceau; 5, Easter Beurré; 6, Catillac; 7, Chaumontel; 8, Gilogil.——*J. F.*—1, Vicar of Winkfield; 2, Beurré Diel; 3, Glout Morceau; 4, Passe Colmar.——*Sarah S.*—1, Court-pendu Plat; 2, Pearson's Plate; 3, Dumelow's Seedling; 4, Court of Wick; 5, Golden Reinette; 7, Beauty of Kent; 6, Court-pendu Plat.‖——*D. J.*—1, Yorkshire Greening; 4, Bedfordshire Foundling. Pears: 1, Comte de Lamy, a very fine specimen; 3, Hacon's Incomparable.‖——*C. C.*—3, Duchesse d'Angoulême; 4, Brown Beurré; 5, Passe Colmar; 6, 17, Easter Beurré; 8, 16, Bezi de la Motte; 9, 10, 13, 14, Glout Morceau; 18, Henri the Fourth; 19, Beurré Diel; 20, St. Germain.‖——*J. G.*—1, Fearn's Pippin; 3, Golden Pippin; 1, Brown Beurré; 2, Winter Nelis; 3, Beurré d'Aremberg; 4, Chaumontel.——*W. H. H.*—A wild purple Plum.——*S.*—1, Brown Beurré; 2, Urbaniste.——*C. B.*—1, Kirke's Lord Nelson; 2, Parry's Pearmain.‖

Names of Plants.—*Anon.*—Gesnera discolor.——*F. W. W.*—A withered flower of some Hedychium.——*A. C.*—Tripsacum dactyloides.——*A. M.*—1. A Gonolobus, apparently hirsutus; 2. Dracæna australis.——*H. Wr.*—1. Mahernia incisa; 2. Gomphocarpus fruticosus. They have no English names worth giving.——*R. G.*—Cattleya granulosa.——*E. C.*—You now see that we are right; for you cannot doubt that the leaf you have had from India is that of the same tree as your false Banyan.——*H. C.*—Oncidium Forbesii.——*J. P.*—Diplotaxis tenuifolia was once called Sisymbrium tenuifolium; Nicandra physaloides, once called Atropa.——*E. T. O.*—Probably Podocarpus excelsa. ¶

Orchidaceæ.—*Orchis.*—An Epiphyte house should not be kept wet in winter. At that period the air should be *comparatively* dry; otherwise when are your plants to rest? There is no work on their special management except Mr. Lyons's, which, we believe, is not sold. As to woodlice, a score toads will soon rid you of them. We will take your concluding suggestion into consideration.

Pears.—*S.*—We have no record of the Beurré Diel having been grown to a larger size than the specimen you sent, which was 14½ inches round, and weighed 18½ oz.——*A. B. C.*—Of the Pears you enumerate, the Glout Morceau is the most proper for a south wall, if you wish fine fruit about Christmas; if you prefer a later supply plant the Beurré Rance.‖

Pelargoniums.—*Amateur.*—Take up your seedling Pelargonium and cut it back in the ordinary way; pot it in a mixture of sandy loam and peat in equal proportions; then place it in the greenhouse for the winter, and keep it rather dry. Make the tops into cuttings, and put them into small pots filled with a mixture of peat and silver sand, putting three or four cuttings round the side of each pot; afterwards place them in rather a dry airy part of the greenhouse, where they will be secure from frost. They will be fit for potting off singly in spring.¶

Pine-apples.—*A Constant Reader.*—To prefer eating the fruit in a green state is not common.‖

Roses.—*A Subscriber.*—The following will answer your purpose, viz.:—Aimé Vibert, Noisette, Corymbiflora, Jaune Desprez, Triomphe de Plantier, Madame Desprez, Bourbon, and Phœnix.‡

Seeds.—*A Constant Reader.*—Pack your seeds in canvas bags, and take care that they are kept in a cabin during the passage.

Seedlings.—*W. G.*—Your violets, having been packed *loosely* in a tin case, along with a piece of ripe Pear, have been pounded to pieces by the shaking of the post-bags. As far as we can judge from the fragments, the variety does not appear to be striking.

Transplanting.—*X. Y. Z.*—Move your Evergreen Oaks in the course of November. Dig a large hole; take care that its roots are saved as much as possible; throw well pulverised soil about its roots; do not tread it much down, but deluge the hole with water so as to puddle it; secure it firmly in its place, so that it may not be rocked by the wind; and you will have done all that prudence would suggest. The quality of the soil does not much matter, if it is neither clay nor chalk.

Weeds.—*A Constant Reader.*—You cannot get Cocksfoot out of a lawn, if there is much of it, without destroying the other Grass. If your lawn is in such a state as you describe, by far the best way will be to plough it up, get out the weeds, and re-sow it with the following grass-seeds, viz.:—Festuca duriuscula, 4½ lbs.; F. tenuifolia, 3 lbs.; Cynosurus cristatus, 7½ lbs.; Avena flavescens, 1½ lbs.; Lolium perenne, 30 lbs.; Poa nemoralis, 3 lbs.; P. sempervirens, 2 lbs.; P. trivialis, 2½ lbs.; Trifolium repens, 11 lbs., and T. minus, 3 lbs. These mixed together will be a sufficient quantity to cover 1¼ acre of lawn closely in a short time.‡

Yellow Noisette Rose.—*Amateur.*—To flower this attend to the growing and perfecting the young wood during the previous season. Want of attention to this no doubt has been the cause of your blooms not expanding. The best way to proceed with your plants is, after they have done blooming, to shift them if in small pots into larger ones, but if otherwise, only remove a portion of the top soil and replace it with some very rich compost, then put them into a close pit, and keep them rather warm and moist, in order to cause them to grow vigorously; take great care, however, that they do not become drawn or get infested with insects. When they have made their growth harden them off (by degrees) by exposing them to the open air, and give them less water; afterwards place them in a northern aspect, and allow them to become rather dry, in order that they may ripen their wood; then rest the plants, and afterwards put them into a cold pit for the winter; give them but little water for the first month, but afterwards increase it by degrees; and when you take them into the greenhouse let them have but little heat or moisture for a week or two. Six good Roses for Pots are Bougère, Fabvier, Napoleon, Devoniensis, Eliza Sauvage, Bernard.¶

Miscellaneous.—*J. Abell.*—The last week in *this* month, or the first in *next*, is the best time for moving Deciduous Trees. Those which lose their leaves *earliest* should be moved *first*.‡——*H. C.*—A Carnation is not a Picotee, but a distinct variety.——*P. T. O.*—You will find some rustic cottages at Ravenscourt, near Hammersmith; but if you wish to see them in perfection, you should visit those erected by the Duke of Devonshire, at Edensor, one of the entrances to the Park, at Chatsworth.——*A Constant Reader.*—We are unacquainted with the Patent Portable Suspension Stove. Any stove will do what you want, if it is not too small.——*Fifus.* Oak-bark decays very slowly, and is a very long time before it is fit to be mixed with soil. It is more apt to poison land than to improve it.——*W. Wren.*—If you wish to know how Botany can be rendered poetical, you should read Darwin's "Botanic Garden," and his "Loves of the Plants." We cannot compliment you on your success in attempting to do what is not worth doing.——*G.*—We cannot recommend nurserymen.‡——*H. G.* will find information respecting the management of Gladioli given at p. 119, 1844. The pot culture of the different varieties of Lilium lancifolium is also mentioned at p. 591 of the same year.‡——*T. P.*—Keep your Fuchsias as quiet as you can in winter, by withholding water and keeping them cool. They must not, however, become absolutely dry. Do not cut them down until spring.‡——*S. S.*—Yes.——*Mediensis.*—No.‖——*M.*—We will inquire about Burckhardt's "Quince," if you will give us the page of his work in which it is mentioned.——*Umbra.*—You must be joking. If in earnest, we can only say that we have no art to infuse life into dead things. The only means you can employ for covering your trees in winter with green leaves, is to induce Irish Ivy to run over them. That may, with care and skill, be accomplished in a few years. *Re-leaf* of another kind we cannot offer you.——*A Tourist* must give his name and address. We cannot insert statements about crops from persons we know nothing of.——*G. H.*—If you will send your address, we will answer you privately.——*R. F. B.*—We do *not* recommend you to emigrate to the United States, unless you are without an alternative. It is of no use to acquire property if it is not secure; and who can tell what will happen in the United States? If you do go, you had better pack your trees in bog-moss in a wooden chest. It is of no use going to the expense of Ward's cases. We are unacquainted with the prospects of Adam's County.——*M. U.*—We will examine your communication with pleasure, and try what we can do—only make it *short*. We are obliged by your suggestions, which are sent to the Agricultural Editor.——*Δενδρων.*—Nonea rosea is not much worth growing. Moricandia arvensis is a violet-flowered herbaceous plant, something like Honesty. The three handsomest Godetias are Lindleyana, vinosa and quadrivulnaera, provided the latter is grown in very poor soil. The Pea you mention is most probably the purple podded Grey.——*Dubious.*—Coral is not a plant, nor the production of insects, but the calcareous crust of marine animals called Zoophytes, whose nature you will find described in the "Penny Cyclopædia," or any such work.——*W. P. P.*—You will find a plan of a frame that will possibly suit you, given at p. 428, vol. 1843. If you build a span-roofed pit for winter work, it should face north and south.‡——*Agrestis.*—We believe the heaviest and hardest of all woods to be Lignum vitæ, the timber of Guaiacum officinale.——*A Subscriber.*—It will not harm your plant of Aloysia citriodora to divest it of its leaves now, for the purpose of drying.‡——*J. M.*—In order to make your young plant of Goldfussia glomerata bloom, you must give it plenty of light and heat.‡——*Katherine.*—Solidago petiolaris is one of the latest plants in bloom; it is very pretty, but it is generally rendered unsightly by frost and wind; Acis (Leucojum) trichophylla is tender; it is not a free bloomer: none of the early flowering kinds of Allium are very ornamental. Bulbine bisulcata is a greenhouse bulb of little beauty. Tangier Fumitory is unknown to us. Hyacinthus brumalis, probably Scilla brumalis of Haworth, is a very doubtful species. Cornelian Cherry (Cornus mascula) is a shrub, or small tree, producing numerous small yellow star-like flowers, in February, before the leaves. Ornithogolum fimbriatum is not very ornamental; it flowers in March, if planted in a dry situation. Corydalis bracteata is very pretty and dwarf. Leucojum hiemale is also very pretty. Orobus vernus is handsome. Erica herbacea and carnea are very pretty in winter. Colchicum chionense is unknown to us. Roman Narcissus requires a dry, warm situation, and protection from wet in winter; it flowers in March. The best Roses for pegging down are the less rampant growing kinds; much, however, depends on the time when the kinds are wanted to bloom; for a long continuance, China Roses are the best; for summer, Mosses are best, and for autumn, the Noisettes. In pegging them down nothing more is required than to make the soil rich with rotten dung, and to fasten the shoots down with strong pegs, about one or two inches long.¶——*Revertens.*—All the back Numbers for this year may be had.

SEEDLING FLOWERS.

Fuchsias.—*A. B.*—The seedling No. 1 has not expanded its sepals; they remain clinging round the corolla; if this be the permanent character of the flower it is useless. In the larger variety there is nothing to distinguish it from many others.——.—3 seedlings, 39, 40, 49. None of these flowers possess sufficient merit to send out; they are pretty, but not equal to many light varieties exhibited this season.*

Pansies.—*J. L.*—Your flower *Evander* was much damaged by being crushed in the box: it is a large flower of good form and substance, but the colour in the lip is not sufficiently uniform, and runs too much into the eye.*——*Amateur.*—The bloom sent is a young and imperfect one; it is cramped in some way, and will no doubt come larger and better; it is a promising flower, round, and of considerable substance.*——*C. N.*—Your seedling is a large and fine flower, having a small white centre, with a well-marked eye, the rest of the flower uniform light mulberry colour: it appears to want a little more substance for so large a flower.*

Petunias.—*A. B.*—Your seedlings, though pretty, are not equal in size or marking to many varieties we have seen this season. Those which approach a yellow colour, as No. 2, we recommend you to save seed from, as it is probable some striking varieties may be obtained.*

*** As usual many communications have been received too late.

SEED WHEAT.—Donnington, near Stow, Gloucestershire.—From the number of testimonials received of the extraordinary crops produced both this year and last, ROBERT BEMAN is induced to offer to the public his Red Cluster Wheat, which both seasons has produced 60 bushels per acre in several instances; and, having been grown upon old turf, and hand-picked before it was planted, it is beautiful seed, and perfectly clean. Price 7*s.* 6*d.* per bushel.

R. B. has likewise a small quantity of the celebrated Whitfield Red Straw White Wheat to dispose of. Price 8*s.* per bushel.

Orders, accompanied by a remittance or good reference, punctually attended to. Sacks marked 1*s.* 6*d.* each.

The Agricultural Gazette.

SATURDAY, OCTOBER 19, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Oct. 24—Agricultural Imp. Soc. of Ireland.

THURSDAY, Oct. 31—Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

Oct. 21—Wenlock, Fairford.
Oct. 22—Framingham, Rayleigh.
Oct. 24—Richmondshire, Grove Ferry, Blofield and Walsham.
Oct. 25—Debenham, Stoke Ferry, Hadleigh.
Oct. 26—Gloucester.
Oct. 28—Chepstow, Wickham Market, Yoxford.

WITH regard to the best practical method of effecting the general introduction and promoting the beneficial operation of the ALLOTMENT SYSTEM, we deem it desirable that the inhabitants of every rural parish should carry it out among themselves. The acquaintance which they may be supposed to possess with their own circumstances and affairs constitutes them the proper agents in the matter. Wherever it is proposed to introduce the system, a meeting of the inhabitants should be called, and a small committee appointed for the purpose.* This committee should obtain a list of such cottagers resident in the parish as are desirous of renting land, together with a detail of the circumstances of each applicant, stating his age, residence, the number and capabilities of his family, the name of his employer, the name of the owner of his cottage, the size of his present garden, the quantity of any land he may elsewhere occupy, the names of owner and occupier of land adjoining; with any other information that may be needed.

These particulars having been ascertained, it will generally, perhaps, be found best to appoint a sub-committee of about three individuals to superintend the carrying out of the system, subject to the supervision of the general committee. This sub-committee in forming their plans should lay it down as a general rule, to be deviated from as little as possible, that every allotment should be near to the cottage of its occupier. This is of great importance; for if it be far off much time will be lost in going to and from it, the manure cannot be so easily made available for it, and it is not, as it should be, under the tenant's eye. The disadvantages of such an arrangement are obvious.

The land should of course be obtained of as good a quality, and at as moderate a rent as possible. It should, however, be borne in mind that the system is not likely to be established on a wide and permanent basis, unless it is made the interest of *all parties* connected with it to diffuse and uphold it. The landlord, therefore, should have such a rent as will remunerate him for subdividing his land, and fencing off the allotments; and such a rent the labourer can very well afford to pay.

In some cases farmers might be induced to sub-let small portions of their fields which might adjoin the cottage of the labourer; and all parish land which can be rendered available for the purpose ought decidedly to be let in allotments.

It will be important for the committee to consider well the position which they shall take between the landlord and the allotment tenant. We think the cottager should hold his land directly from the landlord, and not from the committee. Under such an arrangement every cottager in a parish might become, through the instrumentality of the committee, a permanent occupier of a small plot of ground; the committee might then be dissolved, and the system would work by itself. The committee, therefore, should merely use its influence in procuring suitable land. In some cases, where a number of houses are congregated together, it may be desirable to subdivide a field, the owner of which might object to the trouble of receiving rents from a numerous tenantry. In such a case let a respectable man from among the tenants become answerable for the rent of the whole, collect and pay it in, a small sum per acre being added to the rent of the whole, and allowed him for the purpose of covering his risk and remunerating him. We see no objection to the adoption of such a plan.

The size of each allotment will of course vary with the circumstances of the case. Regard should be had to the age, strength, and leisure of the man, the number and age of the children, &c., and the size of his allotment should be proportioned to the capability of cultivating it which he is thus found to possess. We believe that an error is frequently committed in making these allotments too small. An able-bodied man, with a wife and four or five children, can easily manage half an acre of land, and in some of the cases which we have quoted much more was successfully and beneficially occupied.

We now come to the consideration of a point on which we believe erroneous views are frequently entertained—we allude to the regulations under which the allotment tenant should be placed. We think that the sole object which we should attempt to attain directly by means of these regulations should be the proper cultivation of the land and the punctual payment of the rent. We would not enforce any particular rotation of crops, but would merely stipulate, that a certain portion of the produce should be consumed on the land, and that the manure produced should be returned to it. Every tenant ought to be sure of receiving the value of any improvements he might effect in the land by deep digging or manuring, in the event of his being obliged to leave his allotment before reaping the fruits of them. A time for the payment of the rent should be fixed, and any minor regulations adopted which the special state of the case might require; but beyond this we should not be disposed to go. We would not attempt (as is frequently done) to enforce regulations as to general moral conduct. If a man were a good *tenant*, he should hold his allotment, if a bad one, he should lose it; and having provided for this, we would leave the improved circumstances of the individual to accomplish the change in his moral character which they are proved to be capable of doing. But we cannot believe that it is desirable to impose regulations on him *as a tenant* which it does not fall within the province of *the landlord* to enforce. Whatever may be the character of the labourer, he is entitled to the means of supporting himself and his family. To provide him with those means is to favour his moral improvement—to withold them, is to plunge him into the abyss of pauperism or of crime.

Since the allotment system has been so abundantly proved to be the fertile parent of such great advantages to every portion of the community, and since it is a system so easy of introduction everywhere, may we not call on every individual connected with the land of this country, as owner or as occupier, to promote its general introduction? Humanity on the one hand, and necessity on the other, combine to urge attention to the condition of depressed labourers, and the call of each will become louder and louder till their demands are fairly considered and met.—*F.*

* The introduction of the allotment system wherever it is desirable, is now provided for by the law of the land. An Act introduced by Mr. Cowper and Mr. Miles, and passed in the last session of Parliament, enacts that in any parish where it may appear desirable that the provisions of the Act should be adopted, it shall be lawful for any three inhabitant householders to deliver a requisition signed by them to the officiating Minister of the said parish, requiring him to call a meeting of the owners and occupiers of land, and of the inhabitant householders of the parish, to decide upon the adoption or non-adoption of the Act. This Act afterwards provides for the election of Field Garden Wardens, to whom the future proper conduction of the matter is confided.

WITHOUT entering, at present, into any detail on the most economical method of removing and consuming the various green crops now cultivated by the farmer, we have to submit to our readers the following figures, descriptive of a good plan of harvesting them.

Fig. 1.

Fig. 2.

Fig. 3.

The first of these is a drawing in perspective of a series of heaps, of which Fig. 2 is the longitudinal, and Fig. 3 the transverse vertical section. They are made in the following manner:—Two rows of hurdles are placed upon a firm piece of ground, parallel to one another, and 9 feet apart. The interval between these is filled with roots, the carts bringing them from the field being backed between them, and tilted up at the proper place. The roots are piled up above the hurdles in a ridged or roof-like form, and are afterwards covered with straw, roughly drawn out as thatch, which is kept in its place by the weight of long poles resting upon it. At intervals of two or three yards faggots are placed in the centre of the heap, inclining backwards, and reaching from the ground to the roof (see *a*, *a*, *a*, Fig. 2). These act somewhat as chimneys, and facilitate a due ventilation of the heaps, thus hindering any tendency to heating or putrefaction in the roots.

When one heap is completed, another is built within a foot of it, the passage left being intended as a channel both for the egress of the water which drops from the thatch, and for the circulation of air. No security against frost, at the sides of contiguous heaps, is required, further than that which is afforded by the interlocking of the bushy eaves of their respective roofs. When, however, a series of heaps has thus accumulated, as in Fig. 1, a rough dead-wood hedge should be constructed around them (see section in Fig. 2), and the space between it and the hurdles, which may be 12 or 18 inches, should be loosely filled with straw.

Last winter, the weather during which, however, was not very adverse to the successful preservation of roots, we kept upwards of 1200 tons of Swedes, Carrots, and Mangold-Wurzel in this way, without losing any considerable portion by putrefaction. We shall take an early opportunity of returning to this subject.

THE ANOMALIES OF AGRICULTURE.

(*Continued from page* 690.)

LET those to whom this seems "a marvel and a mystery," and to whom the contemplation of the subject, from this point of view, is comparatively new, read a few pages of Evelyn's "Terra," and see the sort of stuff that passed for science with the Fellows of the Royal Society of his day; take this passage as a specimen.

"Those who have written 'de arte combinatoriâ' reckon up no fewer than one hundred and seventy-nine millions one thousand and sixty (!) different sorts of earth; but of all this enormous number, as of all other good things, they do not acquaint us with above eight or nine eminently useful to our purpose," &c.: and a little further on, in informing his "acute and noble" auditor, where to find the best soil on their estates, he continues: "My lord Bacon directs to the observation of the rainbow, where its extremity seems to rest, as pointing to a more roscid (?) and fertile mould; but this I conceive may be very fallacious, it having two horns or bases which are ever opposite"——!

Such is the direction of the immortal author of the "Novum Organon"!—Such the reply and criticism of the most talented and admired biographer, physiologist, scholar, and naturalist of his day—John Evelyn! Come we now to the next epoch—still amid the annals of the Royal Society—the reading of Sir Humphrey Davy's lectures on Agricultural Chemistry, and from thence to the appearance of Liebig's works. Let it be borne in mind, that from the publication of the "Terra" papers to the reading of Davy's lectures, not more than 135 years had passed; from thence to the translation of Liebig's "Organic Chemistry of Agriculture and Physiology" (or, as the work might indeed with emphatic simplicity be called, *Quantitative Physiology*), there had elapsed but 15 years. Compare this period with that which has elapsed since "Adam delved and Eve span;" or take out the last five years alone, since the quantitative method of Liebig and the "practice with science" of the Royal Agricultural Society have shed their joint and kindred influence upon the art of tilling the earth; and then let us compare, if it be possible to compare, the growth of practice with the growth of science; and judge, if it be possible to judge, what the investigation of the physical sciences has done, how long it has been about it, and what, at an equal ratio of progress, it yet may do for that art which its empirical professors believed to be subject to no rules but those of their own ignorance, and, as ever was the case, disclaimed the infant science until in a few short years it grew to be a giant, and disclaims them. It is indeed a matter of almost startling curiosity, even to those who feel—what perhaps no one ought to feel—only a remote interest in such a subject as Agriculture, to mark its present existence on the face of—I will not say the earth, but I will say a single county—nay, a single parish or estate, of a country even the first in arts and civilisation, and knowledge and wealth, upon the globe. Look on this side of the hedge, you see every new appliance and discovery put into practice; the soil dry, deep, pulverised, and rich, the produce nearly doubled, the very climate improved, and each element made a friend of, as its Maker intended, instead of being an enemy, through the sloth and negligence of man. Look now upon the other side of the same hedge, but on another farm,

"Like a mildew'd ear
Blasting his wholesome brother'"

The soil cold, dank, and unwholesome, with stagnant moisture, coarse in texture, shallow, foul, and poor; the produce scanty, starved, and blighted, the victim of every change, instead of the grateful recipient of each in their genial turn. Without moving a step the observer may

—— "look now upon this picture, now on this,
The counterfeit presentment of two brothers!"

Agriculture as it was, on the one hand; agriculture as it is in some places, and should be everywhere, on the other. It is a view which, whether regarded physically or morally, no age perhaps ever saw, or ever will see in such powerful contrast and relief, as that in which it is

presented to us. We enjoy a peculiar privilege—that of living in what geologists would call a Transition Period. We have, on the one hand, the self-satisfied and perfectly unsuspicious ignorance of the old fashioned practical farmer, as he is now taught to style himself, in our fields; and on the other, the new-born and equally self-satisfied "closet conceit" of the theoretical writer, in our libraries. The man of science upbraids the farmer, because he is not a ready-made chemist, fluminary and practically applying the results of discoveries which the theorist has only just made, and is yet hardly sure of; and the old farmer laughs at the book-gentleman, and asks what *he* can know about farming? The strife has indeed begun—the strife that never yet was absent from the birth of infant science: for nothing, great was ever born without the warning throes of parturition. Let Astronomy, Geology, Geography, Medicine, nay, let the purity of our Christain faith attest that! Can those who read now of conflicts whose very echo has passed away, between the struggling discoveries of master-minds with the prejudices of the age of which they were the pioneers, and usually the martyrs, doubt or wonder that science should be doomed still to encounter every opposition at the hands of those whom it most concerns and will most surely benefit? No! Man is still the same that he ever was: and the very individual who reads, with a glow of triumphant sympathy, of the personal or moral persecutions of a Socrates or a Luther, a Galileo or a Newton, a Columbus or a Park, a Hervey or an Arkwright, little thinks that he is perhaps himself helping to swell the war-cry of human prejudice against some martyr-science of his own day. It would seem as if truth, like refined gold, must go through the furnace seven times heated, before it is duly consecrated for the use and subservience of man. Opposition and prejudice it must encounter: if that opposition be weaker, and that prejudice more transient in our own age, let the praise be given to those whose earlier advance in the great warfare against them has cleared the way for an easier victory and a less hostile reception. It cannot be denied, however, that in respect of the sciences relating to agriculture, discovery has rather suffered from ridicule, neglect, and tardy adoption, than from any very formidable array of actual opposition. Tull and Bakewell were jeered and laughed at, but they survived to turn the tables upon the scoffers; indeed, a recent writer of great acuity draws water from the rock, by a somewhat singular congratulation of his cotemporaries that so much should still remain to be done in the appliances of science to the art in question. "Formidable, indeed," says this writer, "would have been our position had the resources of art and science already forced our lands to their utmost capability of productiveness, leaving no alternative but dependence on other nations for the bread of even a small section of our people: but however strange the fact may be, it is no less historically true, that while the manufacturing and commercial portions of our people, by the application of the discoveries in modern science (especially in chemistry and mechanics) to their respective arts, have multiplied their wealth to a degree which it almost exceeds the power of numbers to calculate, the agriculturists alone have, till within a very short period, remained unconscious of the similar advantages that they also might derive from the application of science to the most ancient of all arts. * *

"Happily, the same concentrated force of scientific discoveries and mechanical inventions which had so marvellously augmented the productive powers of so many mechanical arts and manufactures, has also begun to accelerate the wheels of agriculture, clearly and obviously increasing the productive powers of the soil, in a ratio proportionate to the degree of scientific knowledge, and the amount of aid from improved mechanical implements of husbandry, that have been applied to co-operate with human labour; and no theory or prejudice can hope to withstand the influence of this salutary movement.* * *

"Had these improved systems (even as they now exist) been fully carried out over the whole length and breadth of the land, the capabilities of further increase might have been talked of as questionable; but it is notorious that to this hour there has been hardly any adoption of the greater number of these elements of amelioration—especially the fundamental element of thorough-draining—throughout the larger portion of the midland and western regions of our island; and to this very evil of retarded improvement we may now point for ground of hope, and confident assurance, that the supply of food may be increased in a degree fully adequate to any demand that may arise from our so formidably increasing population. The means of amendment are at hand; they are understood and practised by the more intelligent cultivators of districts which are now the most productive, and little more than half a century ago were the most unproductive portions of our island; and the education of the middling and lower grades of farmers in a knowledge of the systems adopted by their more enlightened brethren, seems to be the chief desideratum, in order to effect the general adoption of these systems throughout the empire."—*C. W. H.*

* See Col. Greenwood's pamphlet, "The Tree-lifter."

SKETCHES OF EAST LOTHIAN HUSBANDRY.

[We beg our readers to correct an error in the last Paper of this series. The average produce of Wheat in East Lothian was there stated to be 2¾ quarters per imperial acre; for this, read 26 bushels per acre.]

Barley.—This grain is not much cultivated in East Lothian, owing to the suitableness of the greater part of the soil for the production of Wheat. Barley, however, is found to pay well when a good crop can be obtained. It is cultivated to a greater or less extent on all kinds of land, and in every part of the county, but it is on the light Turnip soil, and in the upland district, where it is chiefly grown.

The principal varieties of this grain cultivated here are the Scotch or common two-rowed Barley and the Chevalier. The former has been grown in this county from time immemorial, and is considered to be better adapted than any other kind for light inferior soils and elevated situations. It also ripens at least a week earlier than the Chevalier, but the latter yields a much larger produce when grown on good land. The Chevalier is better suited for malting, and is therefore preferred in the low parts of the county, whilst the common Barley is that generally grown in the more elevated districts. The following are the results of an experiment made some time ago by Mr. Hope, of Fentonbarns, with the view of ascertaining the character and value of Chevalier Barley as compared with the Scotch variety. The soil was a dry loam of good quality. The seed allowed per Scotch acre was as nearly as possible fourteen pecks. The field was sown on the 25th March, the common Barley being all cut by the 8th, and the Chevalier by the 12th of August.

Produce per Scotch Acre.

Common Barley, best	51	6	2	3	7	0	1	208
Do. Do. inferior	45	0	5	2				
Difference in favour of the Chevalier					1 qr.			33

The above experiment, with many others instituted for the same purpose, are given in detail in the nineteenth Report of the United East Lothian Agricultural Society.

Barley is generally sown after a Turnip crop, and also occasionally after a summer fallow. When the Turnips are consumed on the ground by folded sheep, which is a very common practice here, the land is ploughed immediately after the Turnips have been eaten off. This is generally about seed-time, and the Barley is sown as soon as the land is ploughed. But when the Turnips are removed from the ground during the winter and early spring months, the land is ridged up as soon after as it is convenient to do so, in which state it remains until the period for sowing the Barley arrives, when a seed-furrow is given to it preparatory to sowing. The grubber is now employed by many farmers with economy and advantage for the same purpose, instead of the plough.

According to the usual rotation of crops observed throughout the county, Barley is succeeded by Grass, either for hay or soiling as might be found necessary. The seeds of the Clover and Rye-grass are sown at the same time with the Barley, the general practice being, after the seeds of the latter crop have been sufficiently covered, and the surface reduced to a fine tilth by the process of harrowing, to roll the land with a heavy roller, and then to sow the smaller seeds either by the hand or with the broadcast sowing-machine, generally the latter. A single or double turn with the Grass-seed harrows usually completes the process, but a second rolling is frequently found to be necessary on strong clay land, for the double purpose of excluding drought and further reducing the surface if cloddy, as the Clovers are not found to succeed well on strong adhesive soils unless the land has been previously well pulverised and prepared for their reception.

Barley is sown from the last week in March to the middle of May. The quantity of seed varies, according to the quality of the soil and other circumstances, from seven to ten pecks to the acre. Five quarters per acre are regarded as a good crop, although five and a-half and six quarters are often obtained; 35 bushels, however, are reckoned a fair average crop per acre.

The medium weight of the common or Scotch Barley is about 52½ lbs., and of the Chevalier 54 lbs. per bushel: but there are many instances of well hummelled Barley weighing 58 lbs. to 60 lbs. a bushel. Barley is used to some extent on every farm. The hinds receive a certain quantity as part of their gains or wages. In many farms the horses get a boiled mixture of inferior Barley and Beans, two or more nights a week, throughout the greater part of the year. Almost the only kind of bread used by the hinds, and other farm servants, consists of a mixture of two parts of Barley with one part of Beans ground together; this bread, though sufficiently wholesome and nutritious, has a black and unpalatable appearance.—*T. Sullivan.*

WHAT IS THE BEST DEPTH OF COVER FOR GRASSES AND CLOVERS?

By S. D. Stirling, Esq., of Glenbervie, near Falkirk.

The experiment shown in the following Table was made to ascertain the exact depth at which each kind of seed sown would grow most abundantly. In 1842, Messrs. Drummond and Sons, of Stirling, made a similar experiment at my suggestion, the results of which were exhibited at the Show in Edinburgh; but, as garden experiments are laughed at by some, and as the difficulty still remained as to the treatment in the field necessary to obtain the best depth, I, in 1843, sowed 15 acres all over with red and yellow Clover, and a third part with each of the following Grasses in addition, viz.:—Italian Rye-grass, Pacey's Rye-grass, and Timothy. Two-thirds of the land intended for each of the Grasses was rolled after the Barley was finished. The Grasses and Clovers were then sown, and half of the rolled portion was bush-harrowed; the other half as well as the part not rolled, was covered in with Grass-seed harrows. I was surprised at the small apparent difference of the crop, but, on closer inspection, the shallower sown seemed thicker planted, and the deeper to have stocked more, from being thinner. It was with a view to settle this point that it seemed necessary to count the plants which would grow at each depth. The seeds were treated in the following manner:—Two boxes, 5 feet 10 inches by 1 foot, were filled with soil; No. 1 to within a quarter of an inch of the top; No. 2 to the top on the one side, regularly sloping to within 3 inches of the top of the other. They were then divided across by slips of wood 2 inches broad, so as to leave fourteen spaces of 2 inches by 1 foot in each box. The same weight of seed was sown in each box, the slips were removed, and the boxes filled to the top with soil. They were placed in a greenhouse for the first ten days, to prevent the risk of heavy rains, which would have crusted the surface. This may have caused the seeds to spring from a greater depth than would have happened under ordinary circumstances. The quantities sown as marked in the first column of grains of sixteen to the drop, were such as each ought to have produced nearly the same number of plants, had the seed continued as good as when sown and counted in spring, with the exception of the Timothy, of which nearly a double portion was sown from the difficulty of distributing so small a quantity equally. A quarter of an inch is too deep for the Poa nemoralis, as the Timothy grew more freely when scarcely covered.

Sown 1st July; counted 1st August, 1844.

No 2, Section of Cover from 0 to 3 inches deep.

The other information to be obtained from the experiment shown in this Table, beyond that for which it was made is, that it requires double the weight of Italian Rye-grass seed to produce the same number of *plants* that it does of common—that in this case at least, the Clovers and Fox-tail seeds, kept over a summer, would have been dear at half price—and that the total of the second column of No. 1 is less than the first column of No 2. I may also mention that, in a similar experiment tried this spring, 1844, and now growing here, the number of plants appear to diminish in the same proportion as shown in No. 2. They are generally most vigorous at three-quarters of an inch of depth, with the exception of Cock's-foot, Rib-grass, and red Clover, which do well to an inch and a half. Whether this difference arises from these depths being most suitable, or from the smaller number of plants, must be ascertained in a future experiment, by thinning them out to a single row. I would recommend all who wish to avoid disappointment, to prove all their Grass, Clover, and Turnip seeds before sowing, by sowing a small weight in a pot, and placing it in a warm situation, and counting the plants which come up, and they will find that 28 lbs. or 30 lbs. of Rye-grass seed may be cheaper than 16 lbs. or 20 lbs., though the price per bushel may be considerably more.

In 1842, when the Grass seeds were bad, and not to be procured of average quality, I sowed of some kinds three times the weight per acre which I had found sufficient in ordinary years, and with similar results. As I was much disappointed by following Sinclair's Tables of the number of seeds per lb., I subjoin a Table of the weight in grains of 16 to the drop, omitting fractions, which will give 190 plants of each, when the seed of

commerce is of the best quality which I have met with during the last four years.

9. Meadow Fox-tail.	4. Perennial Rye-grass.
5. Cock's-foot.	9. Italian ditto.
7. Meadow Fescue.	3. Red Clover.
9. Hard Fescue.	4. Yellow Clover.
1. Timothy-grass.	2. White Clover.

If the seed should prove of this quality I would recommend the following mixture to be sown for permanent sheep pasture :—

9 lb.	of Fox-tail, which will give	1	plant to each	8	square inches
2½	Cock's-foot,	1	,,	16	of ground.
3½	Meadow Fescue,	1	,,	16	,, ,,
4½	Hard Fescue,	1	,,	16	,, ,,
4½	Italian Rye-grass,	1	,,	16	,, ,,
3	Red Clover,	1	,,	8	,, ,,
4	Yellow Clover,	1	,,	8	,, ,,
4	White Clover,	1	,,	4	,, ,,
8	Timothy,	1	,,	1	,, ,,
2	Rib grass,				
1	Yarrow.				

Which will altogether give about two plants to the square inch. If the trial of any seed falls short of the number of 190, by any quantity, say an eighth, then 1 lb. must be added to the Timothy, ½ lb. to the yellow and white Clover, and so on in proportion. It may be asked why I recommend this mixture in this proportion? I answer that, after repeated trials, I have found it to succeed better than in any other. Why do I sow red Clover and Italian Rye-grass for permanent pasture? Because it is too expensive to seed the land sufficiently for the first year with the Grasses which sheep prefer, and because, in consequence, it carries more stock, and I have better pasture the following year. I cannot tell whether this is owing to the quantity of manure which the stock leaves, or to the food for plants conveyed to the soil by the Clover, from the atmosphere, or to the fact which I, as well as others, have noted (Mr. Kay, of Shiphaugh, Stirling), viz., that Grasses grow best when Clover is sown along with them. The Italian Rye-grass gives the earliest bite, and helps to occupy the space which would otherwise be filled with Daisies and other weeds. Why I sow yellow Clover? Because I sowed down a field with Grass, one half mixed with yellow Clover, and the other with white, and the sheep preferred that which was sown with yellow. Why do I not sow Rye-grass, Dog's-tail, Vernal, Poa trivialis, pratensis, and perennial red Clover? Because I sowed these and the others, which I recommend, separately, and put on a light stock of sheep early, so that they should not be compelled to eat that which they disliked. The Rye-grass will not carry through the stock necessary to keep it down in spring, and both it and the Dog's-tail were so much neglected, that I cut a full crop of hay off them. The Poa trivialis, Vernal, and pratensis, in a year or two became very unproductive, the two former suffering from drought, and the last forming a mat of which the greater proportion is uneatable, and which chokes everything else. The perennial red Clover, which I procured from a most respectable seedsman in Edinburgh, proved the common biennial. I therefore do not choose to pay an additional price, and run the same risk again. Besides, I see it neglected in my old pastures, where it grows naturally. For neat cattle I would recommend Rye-grass in addition, and for milch cows that the Yarrow be omitted, as I have found it, when in excess, to impart a disagreeable flavour to the butter.

I have the greatest pleasure in expressing my obligations to Messrs. Drummond and Sons, of Stirling, for their ready assistance in this and all other matters relating to agriculture.

Table of the greatest number of plants I have succeeded in raising, from 1 oz. and 1 lb. of the following seeds during the last four years :—

	No. of Plants per oz.	lb.		No. of Plants per oz.	lb.
Timothy	49,005	784,080	PerennialRye-grass	12,251	196,020
Fox-tail	5,445	87,120	Italian ditto	5,445	87,120
Cock's-foot	9,801	156,816	Red Clover	16,335	261,360
Mead.Fesc.	5,801	112,011	Yellow ditto	12,251	196,020
Hard Fescue	5,445	87,120	White ditto	24,502	392,040

[*Communicated by Mr. Stirling, from the Highland Society's Transactions.*]

ON DRAINING HEAVY LAND.

I PERFECTLY agree with you that there is frequently too much width in drains, and too little depth; the mass of earth to be removed adding greatly to the cost. I will also admit that the small pipes alone (as mentioned by you, and as described by Mr. Parkes in his valuable communications to the Royal Agricultural Society), will after a time (a year or two) carry off one day's rain in three days. But this is only an imperfect mode of drainage, for several reasons. 1st. Because it is two or three years before it will act perfectly, instead of at once drying the soil, and rendering it friable. 2d. Because in dense soils (and to those my theories applied), the retention of water 48 hours longer than is necessary must be very injurious, by depriving it for so considerable a period of the atmospheric action. It acts like drowning, or soaking earth in water for two days, and must unduly expand its particles, absorb heat, and retain in degree that sodden characteristic which drainage is intended to remedy. I consider it an axiom that the friability of the soil will be in proportion to the rapidity of percolation; filtration may be too sudden, as is well enough shown by our hot sands and gravels; but I apprehend no one will ever fear rendering strong clays too porous and manageable. The object of drainage is to impart to such soils the mellowness and dark colour of self-drained rich and friable soil. That perfect drainage and cultivation will ultimately do this is a well-known fact. I know it in the case of my own garden. How it does so I am not chemist enough to explain in detail, but it is evident the effect is produced by the fibres of the growing crops intersecting every particle of the soil, which they never could do before draining; these with with their excretions decompose on the removal of the crop, and are acted on by the alternating air and water, which also decomposes and changes in degree the inorganic substances of the soil. Thereby drained land, which was before impervious to air and water, and consequently unavailable to roots, to worms, or to vegetable or animal life, becomes by drainage populated by both, and is as great a chemical laboratory as our own atmosphere, subject to all the changes produced by animated nature. I apprehend that two days' stagnation of water would endanger either worms or roots. Mr. Parkes justly observed to me that worms act as assistant drainers, occupying the soil which before never contained any living thing; and it is through the innumerible conduits they make that water finds its way so readily to a small pipe at a considerable depth; but I consider, and must maintain my theory, that he who carries the falling water through heavy land in the shortest period is the best drainer, and will the soonest render such land equal to the best. To do this there must be in the drain a large area of porosity. The means of effecting it may vary as opinion varies; but the drain, to be economic, must have the largest porous area in the smallest possible space that will convey the water. I consider that the falling water descending uniformly through the whole surface, and mixing intimately with each grain or particle of earth, is far preferable, chemically and mechanically, to its forcing its way in streams towards the joints of the pipes, whilst the remainder is delayed, waiting a day or two, to take its turn in the same worn channel. For this reason I object to waiting for gaping cracks to make drains act, because it is quite possible the water may rush down such cracks from the surface, and leave considerable masses of intermediate earth unmoistened. The principal utility in drains is, in my opinion, to enable the earth to derive the full benefit of the various and all-important manures with which the falling water and renewed air are so amply charged. Another very considerable objection to the "wait-a-day-or-two" plan is, that the greater quantity of rain falls in the autumnal or winter months, when every day's ploughing lost is of consequence, economically and as regards the welfare of the ensuing crops. This alone should stimulate us to get rid of the obstructive water in a trice, for our autumns are never deficient in moisture, but the reverse. A small pipe will readily carry water when it gets in, but the question as to how and when it enters are subjects worthy the attention and experiment of your numerous and valuable agricultural correspondents. A comparative trial in various parts of one field would convince those who doubt. For my own part I am practically satisfied that my drainage is not too sudden, but that if it errs at all it is in not being quick enough, in such dense yellow soil. It may appear a startling proposition, but I think we are justified in inferring that drains in the summer season occasionally lay dry the soil below them. It is quite clear that if the porous portion of soil above the drain is deficient in moisture, earth below the drain must give up its moisture by capillary attraction, there being no impervious intervening substance between the upper and lower soil to prevent it.—*J. J. Mechi*, 4, *Leadenhall-street.*

Home Correspondence.

Allotments.—The subject of allotments of land, to be let at reasonable rents to persons of the labouring class, well deserves a prominent place in the *Agricultural Gazette*. It seems that the general adoption of the practice will much depend upon landlords; for, besides the usual restrictions in leases against underletting, the time is scarcely yet arrived when a majority of tenant-farmers would freely concur in the proceeding. When we read of 7*s*. or 8*s*. a week being the usual rate of wages for agricultural labour in Wiltshire, and when it is known that in districts of wealthy England, not 50 miles from the metropolis, a similar rate of wages prevails, surely something is wanted to remove a just cause of alarming dissatisfaction among an important class of persons, the value of whose labour—their only commodity for obtaining the means of supporting life—is thus depreciated. And while 7*s*. or 8*s*. a week is paid in some places, and 9*s*. or 10*s*. a week is paid for the same kind of labour in other places of a similar agricultural description, intelligent and impartial observers are not satisfied with the reason probably assigned for the difference—that, in the former case, there is an excess of labour, and not in the latter. But though allotments of land appear so desirable, and their advantage has in so many instances been so undeniably proved, strange cases have occurred—at least to the knowledge of the writer one case has occurred—where this advantage has been refused by labourers. In a parish chiefly agricultural, where the supply of labour has been fully equal to the demand, but not much in excess, and the rate of wages usually fair in comparison with some other districts, an owner of land, whose kind disposition is known, lately appropriated a field of good land for letting in allotments on fair terms to labouring persons, and only a small portion of the land was taken. Such cases are perplexing, and demand inquiry into their causes; and it might be inquired whether there was reason to fear that the farmers would regard the practice with jealousy, as apprehending (unfairly) that it might lead to neglect of their business by workmen. The diffusion of sound knowledge, and of good feeling and principles, will, in time, correct these evils in a country to which Providence has been abundantly favourable.—*H.*

Litter.—There are many thousand acres in this neighbourhood, formerly reclaimed from the sea, which afford the richest pastures for cattle, but which require large and deep dykes to prevent them from being flooded in the winter, and in wet seasons. In keeping these large water courses clear, a considerable depth of heavy soil is excavated. There being in this neighbourhood an inexhaustible supply of sea-sand, it has occurred to me that for cattle-yards, and for sheds in which cattle are fed, this sand, which is quite dry, and carried by the wind around the country, can be substituted for straw as litter for the cattle. It has several good qualities: a soft and dry bed for the animals, very clean, so porous as to prevent the urine and liquid matter of the manure from running off, which would prevent the expensive process of making tanks. It would check the escape of ammonia by constantly covering the wet bedding with dry sand, and it would immediately lick up any solution for fixing the ammonia; and when saturated with the excrements of the animals, would not only be highly fertilising on this account, but would be very beneficial in acting mechanically upon a clay and heavy soil, such as there is always being dug up from the dykes. Thus acting as a substitute for straw, the farmer can use his straw in the form of chaff, mixed with nourishing food, and thus passing through the animals, it will have lost none of its inorganic principles, but the same quantity of silex, &c., will be returned to the soil, as if it had been employed in bedding down cattle, and employing it afterwards as manure; and a much larger quantity of manure would be thus produced.—*Inquirer.* [We have known instances where sand has been used as litter for sheep; and in a year like the present, when straw is by no means plentiful, necessity will, we doubt not, induce many to try the plan, connected with which our correspondent points out so many advantages.]

How to Harvest Cabbages.—Allow me to remark that I have heard that, in Germany, some farmers, when they have a superabundance of Mangold-Wurzel leaves, half steam them, then pack them close in casks, slightly sprinkling the steamed leaves with salt by layers, which keep very well, and are eaten with much zest by cattle in that state. This might answer equally well with Cabbage leaves. Should it succeed, it would benefit the public generally if "Querist" will mention its success in the *Chronicle* at a future time.—*Elysée.*

Two Crops per Annum.—I quite agree with your correspondent, "Cantab," that it is necessary for the English farmer to have two harvests in one year if possible, and I have often thought the Belgian system of growing a green crop upon the same land, and in the same season, that had previously grown Corn, a most excellent one, and worth our attention. I fear, though, it is impossible to introduce it here, the English climate being neither sufficiently early or certain to bring any kind of grain to maturity in time to grow the green food after it. Lord Lovelace's crop of Beans and Cabbages upon the same land approaches nearer than any other, but they neither of them grow well upon shallow soil. I have thought of trying Rye and Cabbages, but I have never seen the former harvested in this county at a period when I thought the latter would have succeeded had the attempt been made, which I confess it never yet has by me.—*A Norfolk Farmer, Fordham, Downham Market.*

[*Professor Johnstone's Catechism of Agricultural Chemistry and Geology.*—This Catechism is a clear and succinct arrangement of the rudiments of these sciences as far as they refer to agriculture; but I have some objections to the manner in which this manual is arranged. The first and most serious of these is—its catechetical form. I think that if the Professor had drawn it up in short and comprehensive sentences, without the form of question and answer, it would have been a far preferable book for the use of our schools. In this form it could have been made use of as a class-book for reading, and at the same time for instilling into the young mind the principles of those sciences of which it treats. Should questions be thought necessary, they could be placed at the end of each section, or at the end of the manual; but I would prefer the questions without answers, so that the pupil would be under the necessity of finding the answer for himself, and thereby giving him additional mental exercise. My next objection is the insertion of the instructions for the teacher in the body of the book. These should have been placed at the end, or on a separate sheet, so that they might only be in the hands of the teacher; but should the narrative form be adopted, they could be continued in the present plan without great objections. It would be a great improvement upon this manual if there were affixed an alphabetical list of technical terms, with explanations for the reference of the scholars, such as acid—how formed, and its component parts (that is, of any particular acid); carbonate, phosphate, nitrate, sulphate, &c.; and even very common terms, as calcareous, solution, dissolve, manure, &c., &c. In short, I would have this Manual of Agricultural Chemistry and Geology arranged as those of Natural Philosophy, published by the Scottish School-Book Association, which I consider superior models of a school-book.—*K., Denny.*

On Bones.—Of all the auxiliary and artificial manures yet found, bones hold the first place, both in effect and in certainty of result. They are applicable to most soils on which Turnips can be grown, and a failure is very rare. My own experience extends to twenty years, and only one failure occurred. My first trial of them happened in Northumberland, on a light sandy loam lying in patches on the outburst of a friable sandstone, in the vast bed of clay on the coal formation. A grinding mill was attached to a flour mill driven by water; the bones

were ground in the forenoon and often sown in the afternoon; and if at any time laid in a heap, strict injunctions were given to spread them thin, in order to prevent heating. Very different is the treatment now, when means are used to produce that state. They were sown by a machine in a continuous stream, at the rate of 3 quarters to an acre; and in every application the crop of Turnips raised by them was superior to the usual quantity of the best prepared farm-yard dung: the following crops, however, were inferior, and a dressing of short dung was applied in the spring to bring them equal on the boned land. On cloddy soils the rutting coulter throws the soil wide, and it does not fall back again to cover the bones; a double mould-board plough was made to pass quickly behind the sower, which threw fresh earth over the bones, and a roll followed. For seven years the crops were beautiful. On the stronger loams in Leicestershire the success was equal in every respect, the bones being sown in a cool state, and containing the portion of dust made in grinding them. On the ferruginous sands in Surrey, bones in the same state and quantity succeeded well; but in one year a partial failure took place on a loamy sand, fallowed and wrought after a crop of winter Vetches. The tilth was rather cloddy, but not too unfavourable. The Turnips brairded well: the plants rose after hoeing, and about half covered the drill, but never grew more. During the season the plants never showed the vigour usually produced by bones; the season may have checked their action; a cold, drizzling rain from the east prevailed at the time of sowing, and for some time after. The preparation of bones by mixing and fermentation has now become fashionable, and the sowing by drop-drill machines. My next experience was in South Wales, on soils of loose poachy loams. The bones were mixed with ashes and earths, and heated with hot lime, repeatedly turned and slaked with urine, suds, and water, and sown with a drop-drill machine at the rate of 16 to 20 bushels to an acre. In every case the crops were beautiful, but not superior to those produced by cool bones; which leaves undetermined the use or advantage of heating the materials. Some farmers mix the ground bones with earths, and produce, by their lying for a length of time in this state, a putrefactive preparation instead of fermentation, and it is found to answer well. No farmer who can command a sufficient quantity of vegetable manure, or farm-yard dung, will ever think of using any auxiliary; but many hilly and inland situations will hardly ever supply the quantity required, and consequently substances will be sought to produce the vegetables, which in their turn will yield the manure required. One very great recommendation of bones is the lightness of carriage; for if a farmer had large masses of vegetable manure at a distance presented to him, the cost of carriage would forbid their acceptance. The prime cost of bones is also less. In dry seasons rolling is essential, in order to compress the drills and the manure, to exclude drought, and retain moisture.—*D.*

Salt.—Several communications on the article "Salt," mentioned in pages 317 and 605, leads me to state that a more valuable substance cannot be purchased, and I would recommend all farmers not to be stingy in its use. How, I will ask, are those large crops of Potatoes produced both in Guernsey and Jersey, but from its general use there? having little to depend upon beyond the sea-weed found upon its shores. With regard to the quality of their produce, that is another question. Col. Le Couteur prides himself in quality—not quantity. He objects to the old jog-trot system pursued by all Jersey farmers; of course he pursues the English fashion, as practised in the Isle of Thanet, his heap of manure being composed of sea-weed, sand, and refuse from the farm-yard. Although I have but a small quantity of land, nothing do I prize so much as salt; I applied it during the dry weather to my Raspberries with complete success, filling in the crack and dispersing it everywhere. My garden and land has had 12 months' fallow, the land being in a desperate state of neglect, full of coarse Grass and as hard as a brick. Potter's guano (liquid) had no effect, but where I applied my pond-water with salt, I found wonderful effects; my Strawberries, though neglected, were fine through its use, although I regret to say that it was the cause of death to many poor frogs; the least quantity seemed fatal. When in the state of New York and also in Canada, I was surprised to find that it was their custom to give horses and cattle a handful or two of salt in their water to drink; nothing is such a treat to them, or so anxiously sought after. In several spots (for I have a variety of soil in a small compass) of a clayey nature, I am troubled with the Canadian Thistle, (I call it,) which roots very deeply. I have, after pulling it, tried salt, and I think it will be found to be the only remedy, as upon digging I perceived its effects.—*Verax.*

On Flax Seed as Food.—Conceiving this to be a truly important subject for the consideration of the farmers of the United Kingdom, I have much pleasure in referring to the subjoined account of the results obtained by the use of Flax-seed Compound, as communicated by Sir Charles Burrell at the recent meeting of the Arundel and Bramber Agricultural Association. I extract the following report from the *Sussex Express*:—"At the late meeting of the Agricultural Association here, Mr. Warnes advocated his system of box-feeding. He said that in Sussex, Turnips could not be grown as in Norfolk, but Nature had done much in giving them a fine pasture; in addition to that, they should use boxes for their cattle, such as many of them had seen that day on the Show-ground. With regard to summer grazing, he had found six stones of Grass, which would fatten cattle, was only equal to one of hay, which would not. By this means, and the use of boxes, three bullocks ought to be fattened instead of one; and this was no longer an experiment, for hundreds and thousands were now fattened in that way. The Chairman then read the following interesting statement:—'Account of six heifers, which were put into Sir C. Burrell's boxes on the 15th May last, to be fattened according to Mr. Warnes's system of summer grazing, but which had no compound till the 16th of June. Cost price of each—No. 1, 10*l.*; No. 2, 10*l.*; No. 3, 9*l.*; No. 4, 8*l.*; No. 5, 7*l.*; No. 6, 6*l.* Nos. 5 and 6 have been sold; No. 5 only has been killed; No. 6 is to be slaughtered in a day or two. No. 5 was sold to Mr. Page, at 3*s.* 10*d.* per stone. She weighed 75 stones, and therefore realised 14*l.* 12*s.* 6*d.*, or 7*l.* 12*s.* 6*d.* clear of the cost price. From this sum we deduct the cost of keeping. 1st. The Grass from the 15th May to the 9th September, when the butcher took the heifer away, or 17 weeks at 1*s.* 6*d.* per week. 2dly. The compound, from the 16th June to the 1st August, at 5lbs. per day, and from the 1st August to the 9th September at 14lbs. per day, amounting in the whole to 56 stones, which, at 7*d.* per stone, gives 1*l.* 12*s.* 8*d.*, or for Grass and compound, 4*s.* 10*d.* per week, or for the whole time, 3*l.* 4*s.* 10*d.*, which, with the 7*l.* paid for the animal, leaves a clear profit of 4*l.* 7*s.* 8*d.*, independent of manure — an important consideration. The cattle numbered 1, 2, 3 and 4 consumed 50lbs. of Grass each per day; Nos. 5 and 6, 35lbs. each per day. Two weeks they had Vetches. It ought also to be remembered that the Grass was obtained principally from waste ground, such as sides of roads, corners of fields, fences and gardens.'" The foregoing statement is confirmatory of those in my papers on this subject which recently appeared in the *Agricultural Gazette*, as exhibiting the results obtained by the use of the Compound at Horkesley Hall. There is not indeed a more important article of food for the various domestic animals of the farm than Flax-seed. No expensive apparatus is necessary for testing its value, and it is with a view of inducing such farmers as have not hitherto used it to give it a trial, that I venture to direct their attention to the foregoing important statement of the results obtained by Sir Charles Burrell.—*J. Sproule.* [In the following extract from a letter of Sir C. Burrell's, which has lately appeared in the *Brighton Gazette*, another proof is seen of the excellence of Mr. Warnes's system of feeding:—"I have this week a second instance of the soundness of Mr. Warnes's system, in the sale and slaughtering of the second and least of the two Sussex 2-yearling steers, which weighed 72 stones 3 lbs. of very prime beef, being 4 stones 3 lbs. above the weight expected from her measure, and also above the butcher's expectation, who preferred buying by weight to purchasing according to the measured weight. The original cost was 6*l.*, and being sold at 3*s.* 10*d.* per stone, it fetched 13*l.* 18*s.*, a profit worthy consideration as derivable from Mr. Warnes's box-feeding system, with an expense of only about 30*s.* to 35*s.* for each box, if (as I conclude) a range of boxes be built. I am myself so entirely satisfied of the goodness and soundness of the system, that I have ordered a hovel to be converted into five more cattle-boxes, making 13 in all—a proof of my conviction of the correctness of all Mr. Warnes has advanced."—*C. M. Burrell, Knepp Castle.*]

Ichaboe Guano.—I have lately purchased 10 tons of Ichaboe guano; but in order to have it genuine I sent a sample to a chemist to be analysed. The analysis is as under:—

Water	148.31	Soda	30.00
Ammonia	105.41	Sulphuric acid	50.90
Organic Matter	146.36	Oxalic acid	85.41
Silica	59.84	Uric acid	68.09
Chlorine	26.10	Phosporic acid	99.12
Lime	95.20	Carbonic acid	16.04
Magnesia	46 10		
Potash	23.20		1000.00

Another chemist to whom I showed it pronounced it to be excellent; but told me that I ought to mix gypsum with it, otherwise a large portion of the ammonia would escape into the air. I shall be much obliged if you will inform me in what manner I can best apply the guano to Wheat, as I intend to commence drilling immediately. My farm consists of various soils, from a light soil on a subsoil, varying from a quicksand to a very stiff clay. I should also be glad to be informed whether a good dressing with clay would not improve the light soil, as it appears to require consistency and depth.—*A Constant Reader.* [All light soils will benefit by such an application. Guano is better applied to Wheat in April than in autumn. You can sow 2 or 3 cwt. broadcast, and harrow it in over the young plants; do not fear that you will injure your crop by so rough an operation. The guano should be sown in wet weather. Gypsum may be beneficially added if your soil does not contain a sufficiency of it, but it is questionable if it would tend to fix the ammonia in guano unless both were dissolved in water.]

Dibbling Wheat.—I am much pleased to see that some attention is paid to the poor and labouring classes, for in proportion as they are benefited, the community is benefited. I now allude to an article in the *Gardeners' Chronicle* of the 7th inst., in which it is stated that, by the allotment of lands in one parish, the poor-rates have been reduced from 5*s.* 3*d.* to 2*s.* 6*d.* in the pound, and parties who were living upon the rates are now contributors towards them. With such abundant evidence of the advantages of dibbling seed in preference to any other method of putting seed into the ground, it would be rendering a very great service to persons having a few acres of ground if an instrument was invented to facilitate this tedious mode of putting seed into the ground. I am of opinion that a very simple instrument, and at a very small cost, could be made which would enable two boys to do as much as four can do with the dibble now in use. I beg, therefore, to suggest my plan, and leave it with some of your mechanical readers to act upon it. A dibble, with a handle about 18 inches long, made like a shovel-handle, at the lower end of which should be fixed a plate and four dibbles, with flanges 1½ inch from the point of each (that being considered a sufficient depth to put the seed into the ground), the dibbles, by means of a spring-handle, being made to turn half-way round, would be an instrument of a kind which I conceive would be of very great advantage. If you think well to give it a place in your *Chronicle*, I hope it will meet with attention.—*A Constant Reader.*

Dairy.—Can you explain the cause of the strong bitter flavour which is perceptible in the cream of some dairies at the present time, and is said in the north of England to occur occasionally in different places? The bitterness is not to be perceived in the milk, nor in the cream till it has stood for one or two meals; the butter is not affected; the cows are pastured and eat no other food; and it has been ascertained that the evil is not confined to the produce of any one cow in particular, of the five milked in the dairy alluded to especially; and the milk is immediately poured from the pail into white Staffordshire milk-pans.—*Lactæon.*

Early Harvesting.—Having cut a field of Wheat about ten days before being perfectly ripe, according to the views recorded in some of your late publications, I am desirous of acquainting you of the difficulty I had in making sale of it, although it was on all hands acknowledged to be a good grain of steel Wheat. When I sent it to the mills it was rejected, as having been cut green. My horses returned with their loads, and I was forced to send the grain to Limerick market, a distance of 28 Irish miles, where I with difficulty got only 13*d.* per stone. Now, Sir, if it be true that the farmers and millers of England find it advantageous to cut green, how came such ignorance on the part of those in a quarter of the country where so much Wheat is grown, and where there are so many extensive buyers? I lost the expense of my horses and men for one day, and the carriage of 8*d.* per cwt. to Limerick. Any information you can give me on this head will be thankfully received; and should you be able by advice or reproval to effect a change in the views of the millers, next year may not be so unfortunate to those who cut green.—*J. V. Bruden, M.D.*

Thin Sowing.—Having read Mr. Davis's little "Treatise on Thin Sowing," I was induced last spring to try it on a small scale with Scotch Potato Oats without dressing. The following is the result:—On two lands, containing 1 rood 6 perches, seed at the rate of 2 bushels per acre, drilled 12 inches between the rows, produced 2 qrs. 3⅓ bush.; weight of Oats, 41 lbs. per bushel; straw, 23 trusses, 4 lbs. The adjoining two lands, with the remainder of the field, sown at the rate of 3 bushels per acre, 9 inches between the rows, produced 2 qrs. 1 bush. 1 pint; weight 41½ lbs. per bushel, and 20 trusses 2 lbs. straw; which shows an advantage of the thin sowing at the rate of 1 qr. 1 bush. of Oats, and 10 trusses 22 lbs. straw per acre, besides the difference of seed. The thin sown Oats were not so ripe when cut as the others, which I think will account for their being rather lighter. The increase of Oats, straw, and saving of seed, will amount to about 1*l.* 15*s.* per acre.—*Saml. Relf, Reigate.*

Curiosity.—I send you a Potato into which a young shoot of a reed has grown so as to split the Potato. This occurred in some boggy land which has been made dry; the reeds are not quite killed yet, because the subsoil is blue clay. I suppose that the reed has been driving into the Potato for moisture, being at the last gasp from extreme thirst. Are such instances common?—*J. S.* [We have known the roots of Couch-grass pierce the bulb of the Wild Hyacinth.]

Weeds.—A correspondent of yours wrote some time ago upon the destructiveness of Weeds on the headlands of fields and under hedges; pray let me add railroad-banks and waste land. Surely it would pay for the poor to be employed cutting down Thistles and other Weeds, which are now on all the roadsides, and are elsewhere allowed to flower and seed, and to be spread all over the adjoining country, increasing the trouble of the poor farmers a thousand fold for the year following.—*Cockney.*

Dipping Sheep.—I believe I once before alluded to this in your Paper. I, however, do it again in consequence of having just had my flock dipped for this year (now the 4th or 5th year I have had it done), and in 51 long-wooled sheep there was not (as my man assured me) one single tick to be seen. If those who keep sheep would reflect upon the comfort to the animals, of being divested of the swarms of vermin which generally crowd them, humanity alone would surely lead them to undergo the trifling expense and trouble. But when you add to this the great difference in the quantity of food consumed—between a sheep that, as soon as it has satisfied its appetite, adjourns to the nearest gate or post, and there rubs might and main till his empty stomach drives him to his pasture, and another sheep, who, having filled itself quietly, lies down and takes its nap—it becomes a question, and, with large flock-masters, a serious question of profit and loss. And not only this, but at the end of a few weeks, the undipped sheep will, as well as having destroyed most food, be infinitely in worse condition than the contented one. When I first heard of Bigg's Composition, I had a valuable flock devoured by scab, which I could not cure, though I tried all means, and went to much expense. One dipping cured

them at once. My sheep are now all I could wish; they are always easy, never rub, lose no wool, and attend at all times to their business—eating and sleeping. I have induced many of my neighbours, during the last few years, to try the composition, lending them my apparatus, and all I can say is, that all who used it last year have borrowed it this; all say it cured the scab, and one that it also destroyed the foot disease, which has been so prevalent. This last, however, I do not vouch for, but for the immense comfort to the sheep, and benefit to the owner of the flock in the other respects, I have great pleasure in giving my humble testimony; and, as a lover of sheep, from a wish that so very valuable, simple, and inexpensive a process should be resorted to by all who keep them, and from a conviction that great benefit would arise to the farmers and the community at large, for the increase and value of mutton and wool, I should be very glad if you could find room for this communication. I would gladly afford information to any one on the subject, but they would get it better, perhaps, from the seller of the composition, Mr. Bigg, with whom I beg to say I have no communication but as a purchaser. —*W. D. F.* [A known correspondent.]

Potatoes.—Several of your correspondents appear to have sought in vain for a remedy for the grub and wireworm; my plan is this, and I think it the best remedy where there are no rooks in the neighbourhood:—On taking up Potatoes, I coax two or three favourite old hens beside me, and when I turn up an infected Potato I disperse the earth about, although in most cases shaking the stem is sufficient, and should they stray I reserve them in a basket for them. If farmers would but take a little trouble in light soils, they would discover hundreds of new sorts of Potatoes among their old stock, without being obliged to change their seed and waste their time in descanting upon their seed being degenerate and infected.—*Verax.*

Roots of Wheat.—In your Number of the 31st of August last, you express a wish to be informed as to the extent of the roots of the Wheat plant. About 30 years ago, a series of experiments were made by Mr. Badcock, of Pyston, near Watlington, in Oxfordshire, with a view to ascertain this fact. I am told that by digging pits by the side of the plants, he extracted the roots entire. He embodied the result of his experiments in the form of a letter to the late Earl of Macclesfield, then President of the Board of Agriculture in London. This letter was published by the Board, and a medal awarded to the writer. The late Sir Jos. Bankes, to whom the subject was new, provided glass cases for the specimens, which were kept at the office of the Board, and on its being broken up, it is believed that the specimens were removed to the Society of Arts. In addition to this, a plate was engraved from drawings made by Mr. Badcock's son, now resident in Oxford, by which it is shown that the roots descended into the earth six feet. There are six figures in the plate, drawn to scale, showing that at progressive stages of the growth of the plant, the root descends rather deeper into the earth than the plant rises above it. This plate may be found in a book published by Mr. Badcock on the comparative price of Wheat and other grain for a long series of years.—*J.C.C.*

FARMERS' CLUBS.

Leyland, Lancashire.—At the Annual Meeting and Show of the Agricultural Association here, a Report on the farms competing for prizes was made by Messrs. Logan and Lauder, the inspectors, from which we make the following extracts:—The inspectors urge on those who have the management of the different farms that have been inspected, with reference to the thorough drainage of the land, that drains be cut in a parallel direction, so as to carry off the water that falls on the surface, and also the under water, in the shortest and straightest course that can be found, and also that they be cut to the depth of from 28 to 30 inches, instead of from 18 to 20 inches, which would be more permanent, and the stones would be out of the reach of the plough. The inspectors draw attention to the want of green crops, such as Turnips and Beans, in proportion to the size of the farm; those crops should be sown in drills, instead of the broadcast system. The inspectors advocate the above principles, and they practically put them in execution upon land inferior to any of the farms which they have inspected; and they consider that the system can with profit be generally adopted. Nothing, they presume, is so likely to effect good cultivation, as having the land dry, keeping it perfectly clean, and under the green-crop system, with a proper rotation of white crops. And they wish to draw the attention of the farmer to the great essentials of Turnip growing, viz., a soil thoroughly dry, and well cleansed and pulverised when the seed is sown, care in keeping it clean, and attention to the thinning of the plants, at once, and at proper time, and at proper distances from each other; care in removing the soil from the roots of the young plants, and in the earthing up at the latter end of the season, not to lay the soil to the Turnip, but to allow the plant to have room to grow on the top of the drill, as the inspectors have found several crops heaped up in the same way as Potatoes, which is against the swelling of the root. The inspectors recommend a more extensive breadth to be cultivated, as they have found, generally, a short breadth to the size of the farm. Many allege, and no doubt with truth, that additional labour and additional manure are required in the cultivation of green crops, Turnips especially; but the inspectors submit that, unless labour and manure are expended, there cannot be any remunerating return to the farmer. The abundant supply of food for cattle by the green crops, particularly in a season such as this, when short of hay, will amply compensate for any additional outlay. The farmer who has cultivated his green crop can always see his cattle looking well, and is at the same time continually laying up a plentiful supply of rich manure for his future use. The inspectors have also to state that Mr. Scotson's Turnips are the largest in growth that have come under their notice this season; but are sorry to observe many entirely eaten off to the surface of the land by rabbits or hares, which is very discouraging to the tenant, after all the expense and trouble of cultivation. The entries for the cultivation of drilled Beans have been few, but the inspectors would suggest a more extensive cultivation of these crops over those broadcast. The land, in the first place, must be clean. Wheat or Oat stubble early ploughed in the autumn, dry; and in the spring, to forward the sowing in due season, the grubber is the only implement that should be used before drilling up; a fair supply of manure should be used, and the after-culture properly attended to with the hand-hoe and drill-harrow. For draining, the entries have been few, and it appears to have been very much neglected over the Society's district. To this subject the inspectors wish to call the attention of the proprietors, as this permanent improvement is the foundation of all good husbandry. Unless the land be laid thoroughly dry it is useless for any one to attempt to improve it with profit. The inspectors would call the attention of the Society, and proprietors in the district generally, to the drainage on the farm of Mr. Hood, New Inn Farm,—he having drained 5209 rods, of five and a half yards per rod, this spring and summer, the work being in operation when they were on the inspection, on the 3d of September last. The drains run parallel to each other, and at regular distances, from 5 to 6 yards apart, and carried through the whole field, without reference to the wet or dry appearance of the land: the small drains are cut 30 inches deep, filled 15 inches with clean gravel, and covered with a sod, and the soil filled in. The main drains are cut 32 inches deep, and built with stone, and filled with gravel above the covers. The landlord opens and fills the drains, and the tenant carts the material. The work is well executed in all the departments, and gives great credit to the landlord, agent, and workmen. (Signed) JOHN LOGAN, GEORGE LAUDER. — The following remarks were shortly afterwards made by Mr. Neilson: He said he had himself begun to drain, and drained 45 acres with broken stone, and Lord Derby, his landlord, had afterwards drained 50. Now, the entire charge of draining was paid by Lord Derby, and interest charged. Drainage is the province of the landlord. It is a permanent improvement, and should be effected at the cost of the owner. It was better that the landlord should do this and charge an additional rent, than that the tenant should so invest his capital, which might be otherwise employed in making improvements more within his province. It was the tenant's interest to pay a higher rent for a drained farm than an undrained one. When he proposed to pay 10 per cent. on the outlay, his landlord had said that it would be a high charge, as they were draining extensively. He said he would rather pay 20 per cent. than it should be undone. It was better for the tenant to pay 3*l.* per acre for drained land than 2*l.* per acre for land undrained. If the landlord was unable or unwilling to pay the expense, let the tenant get a long lease and undertake it himself. Draining was the first step; it must be taken. He had said what was the landlord's work; now he would tell them what was the tenant's. Deep ploughing, manuring, and weeding clean. How often did they hear tenants complain of the expensiveness of manures, at the same time that they were allowing the most valuable portion—liquid manure—to run waste into the nearest ditch! How could they expect to farm successfully thus? A hole made in the ground, or a tub sunk, would collect the liquid manure of two or three pigs and two or three cows, and the wash of the house, and this would suffice for 30 tons of Turnips and 70 bushels of Wheat. The tenant farmer is the centre of the social system of Agriculture; he supports, on the one hand, landlords by rents, and on the other, labourers by wages.

Harleston, Norfolk.—I herewith furnish you the resolution arrived at by the members of the Harleston Club, on the 2d inst., on the subject of Farm-labour:—"That it is the opinion of this Meeting that 30*s.* per acre is the amount generally expended in labour on the well-cultivated heavy land farms in this district, although the average is considerably less; but that, if security be given to the tenant, on the principle advocated by this Club, viz., length of tenure or Corn-rents with liberal covenants, a sum varying from 30*s.* to 40*s.* per acre, according to soil and situation, might be advantageously expended." It cannot but be exceedingly regretted that the landlord and tenant's views should be so disunited; and until a great change is effected, agriculture will slowly progress.—*J. G.*

Reviews.

The Book of the Farm. By Henry Stephens, Editor of the "Quarterly Journal of Agriculture." William Blackwood and Sons, Edinburgh and London.

THE last part of this voluminous work is now published. The unnecessary prolixity with which its author is often justly chargeable, is certainly too small a fault in any degree to balance the many and high merits which belong to it. In the last part there are useful chapters on Agricultural Experiments, on Farm Accounts, and on the Rent, Lease, Stock and Capital of a Farm.

The Author concludes his work with the following passage, addressed to his readers, descriptive of good farming:—

"If you will but follow the prescriptions I have given, for conducting the larger operations of the field, and for treating the various animals of the farm; and—not to mention the proper ploughing and manuring of the soil—as the practice of every farmer demonstrates the necessity of affording due attention to those most important, because fundamental operations;—if you finish off your fields in a manner indicating care and neatness, ploughing round their margins, and turning over the corners—if you keep your fences clean and in a state of repair—your fields free of weeds—if you give your stock abundance of fresh food at regular intervals in winter, and supply them with plenty of clean water on fresh pastures in summer—if you have the farm-roads always in a serviceable state, and everything about the steading neat and orderly;—if you exhibit skill and taste in all these matters, and put what is called *a fine skin* on your farm, you will not fail to earn for yourself the appellation of a good and exemplary farmer."

We may safely assert that the "Book of the Farm" is the completest work on Agriculture which has yet appeared in this or indeed in any other language.

The Farmers' Ready Reckoner, or Glasnevin Agricultural Tables, by Thomas Skilling, Agriculturist to the Board of Education, National Model Farm, Dublin. Curry and Co., Dublin.

A LITTLE volume filled with Tables, illustrated by examples, for showing by inspection the acreable quantity of any growing green or grain crop, in drill or broadcast, and also for regulating the correct distribution of farmyard and other manures. It also contains a Table giving the quantity of labour of various kinds that ought to be performed in a given time at a given rate of working. It gives the results in measures of various kinds; according, for instance, to the imperial, Irish, or Cunningham acre. The greater part of the book is taken up with Tables for enabling the calculation of such problems as the following:—

"Having a field sowed one-half with Rape and the other half with Vetches for spring food; and being anxious to know the comparative value of these crops for the purpose, it is desired to know how this may be accomplished. Having taken a square yard, that is, 36 by 36 inches, in different parts of each crop, and obtained an average, I find the Rape weighs 7 lbs. and the Vetches 5½ lbs. I go to Table No. 10, 36 by 36 inches, and opposite

	Tons.	cwt.	qrs.	lbs.	
7 lbs. in left hand column I get	15	2	2	0	for Rape.
5½ " " "	11	17	2	20	for Vetches.
In favour of Rape	3	4	3	8	"

Miscellaneous.

Agricultural Implement Clubs.—You expressed a desire to hear from some member of the Richmondshire Agricultural Association, how the plan adopted by that Society of purchasing improved agricultural implements, using them through the year, and then selling them, had answered. When this Society about three years ago began to attract attention, a resolution was carried at the general meeting, by which the President, R. M. Jaques, Esq., was empowered to purchase for the Society agricultural implements to the value of 100 guineas. Among the implements selected were Crosskill's Clod-crusher, Grant's Hay-rake, the Uley Cultivator, Ducie's Chaff-cutter, Wedlake's Cake-crusher, Biddel's Scarifier, Cottam and Hallam's Dynamometer, &c.; most of which were previously unknown to the majority of the farmers in the district. Some of these articles were taken out and tried by various members of the Society during the following year; but we find it stated in the Transactions of the Society for 1843, that, "In the Report last year it was proposed: first, that the implements purchased by the Society should be tried during the present year, by any members wishing to do so; this, however, has been found almost impracticable to any extent, from their being constantly out of order; and, secondly, it was proposed that they should be sold by auction at the ensuing meeting. Your Committee have, however, thought it a more desirable plan, especially as securing the funds of the Society, to award them as premiums, which will enable them to purchase again during the present year." Several of these useful articles were consequently disposed of in this way to parties who were likely to appreciate their worth; and the Society again resolved "that the President should be empowered to spend, during the ensuing year, for agricultural implements, a sum of money not exceeding 100 guineas." In accordance with this resolution, additional articles of great utility were carefully selected from the works of Ransome, Ducie, Dean, Crosskill, Barrett Exall and Co., and other first-rate makers. This encouragement to the implement manufacturers, joined to an avowed intention of giving a full and fair trial to each article exhibited, induced many of the most eminent manufacturers in the kingdom to attend the Richmondshire Agricultural Society's meeting in 1843. A whole week was spent in examining and carefully trying the various implements brought forward, and knowledge of lasting importance to the farmer was disseminated. The members of this Society, and the agriculturists of the district generally, have thus had an opportunity of seeing implements of high pretensions and great cost put to their various uses, and their merits fairly tested, without any risk to themselves. The result has been shown by many of our best agriculturists getting chaff-cutters, drags, clod-crushers, &c., &c., for their own farms; and by our local implement makers showing a desire to produce useful articles of superior work-

manship. It seems likely, however, that the Society will at present cease purchasing implements in this manner. The principal object has been achieved, namely, that of rousing a spirit of inquiry in the breast of the farmer, and showing him that better implements for farm purposes than those he had been accustomed to had been invented; implements calculated to lessen the expense of producing his various crops, and thus enabling him to meet with greater ability the many claims upon the fruits of his hard-won industry.—*Correspondent of Mark-lane Express.*

Report of the Thorough-Draining executed on the Estate of Edward Lucas, Esq., Castle Shane, Monaghan, by Fitzherbert Filgate, Esq.—We next proceed to the field containing 7A. 0R. 22P. This field is likewise stiff clay, upon a subsoil much resembling that already described. The draining of this and the adjoining field was extremely simple, from the slope of the ground being uniform and all in one direction. The prices paid in this case were as follows:—for breaking stones, sodding, and filling $3\frac{1}{8}d.$ per perch for small, and 5*d.* per perch for main drains; the stones in this case were carted a mile, and provided by the contractor. The cost was as follows:—

No. of acres in field.	No. of perches of small drains.	Price per perch.	No. of perches of main drains.	Price per perch.	Total cost of field.	Cost per acre.
A. R. P.		*s. d.*		*s. d.*	£. s. d.	£. s. d.
7 0 22	1131½	0 5½	57 3-5th. 24	1 0 0 5½	29 4 7	4 1 11

There are 24 perches of main drains charged at 5*d.*; that is the cost of cutting, as we had stones that had been in old houses, and drew them with the farm-horses. If the same price be charged for these 24 perches as for the rest, 15*s.* must be added to the cost, making it amount to 29*l.* 19*s.* 7*d.* This field was broken up for Oats, and produced a very fair crop, not yet threshed. The next field, which is only separated from the preceding by a fence, was then commenced. It nearly resembles that last described, as to inclination of surface. The soil is heavier, being for the most part stiff yellow clay; a part of this field was first done, but the person who had contracted to lay down the stones, not being able to fulfil his contract within the time specified, and seed-time being at hand, I was obliged to defer doing anything more until after harvest, which, however, gave me an opportunity of testing the difference in produce of the drained, compared with the undrained land, and the result is the more satisfactory, as the ground was not selected to make the experiment on. The part of this field first done consisted of 4 A. 2 R. 1 P., and was paid for at the following rates:—

SMALL DRAINS.

Cutting drains, breaking stones, filling, and sodding	3⅛*d.* per perch.
Laying down stones	2 3-16ths ,,
	5 5-16ths

MAIN DRAINS:—

Cutting, &c.	5*d.* per perch.
Laying down stones	6 7-8ths ,,
	11 7-8ths

The total cost of this part of the field would therefore be as follows, viz.:—

Number of Acres in field.	No. of Perches of small Drains.	Price per Perch.	No. of Perches main Drains.	Price per Perch	Total cost of field.	Cost per Acre.
		s. d.		*s. d.*	£ s. d.	£ s. d.
A. R. P. 4 2 1	728 76 4-5ths	0 5 5 16ths. 0 2 3-16ths.	49⅜	0 11⅞	19 11 4	4 6 8

There were 76 4-5ths perches to which stones were drawn by the farm-horses, the stones having been thrown in a heap at a former period. The main drain was carried farther than the parallel drains extended, leaving 11 1-5th perches to be made. The remainder of this field, containing 4 acres 1 rood, was proceeded with immediately after harvest. The prices for cutting drains, breaking stones, sodding, and filling them, were the same as that before given in same field—namely, $3\frac{1}{8}d.$ per perch. The stones were bought at 3*d.* per ton, and the drawing was paid for at the rate of 3*s.* per day for cart, man, and horse. The expense of the stones was in this way very considerable; I conceive too high, but circumstances occasioned the trial. The former prices, in consequence of the great competition, were certainly too low; the expense in the present case was nearly $5\frac{1}{4}d.$ per perch. The outlay of this part of the field stands as follows:—

No. of acres in field.	No. of perches of small drains	Price per perch.	No. of perches of main drains.	Price per perch.	Total cost of field.	Cost per acre.
A. R. P.		*s. d.*		*s. d.*	£. s. d.	£. s. d.
4 1 0	645 1-5th.	0 8⅜	11 1-5th.	0 9	22 18 0	5 7 9

The produce of the different parts of the field was kept separate, and was found to have been as follows:—Part drained, containing 4A. 2R. 1P., produced 533 stones of Oats, being 118 stones per acre, while that part undrained, containing 4 A. 1 R., produced only $336\frac{1}{2}$ stones, or at the rate of 79 stones per acre. The difference in value of crops, taking Oats at 8*d.* per stone, would amount to 26*s.* per acre, exclusive of the value arising from increased quantity of straw, which was at least one-third more on the part drained.

We next proceed to the field containing 6 A. 0 R. 17 P. The cutting the small drains, breaking stones, sodding, and filling, was done for $3\frac{1}{8}d.$ as before. The stones were quarried in a field in the demesne, at $1\frac{13}{32}d.$ per perch, for large and small drains. The carting was done with the farm horses, the stones having been laid down as occasion offered. In this way the money actually paid amounted to—

No. of acres in field.	No. of perches of small drains.	Price per perch.	No. of perches of main drains.	Price per perch.	Total cost of field.	Cost per acre.
A. R. P.		*s. d.*		*s. d.*	£ s. d.	£ s. d.
6 0 17	774 3-5ths.	0 4 17-32	280	0 6 16-32	22 1 11	3 12 4

We next proceed to the field containing 1 rood, 5 acres, 20 poles. The soil of this field and the one next to it is greatly inferior to any of those hitherto described, as it chiefly consists of thin clays upon a subsoil of impenetrable hardness, abounding in many parts of the field, with moorband pan. It was drained last autumn, and it is intended to have it ploughed for Oats this season, and after that crop is removed, then subsoil-ploughed. The prices as before, cutting sodding, breaking stones, $3\frac{1}{8}d.$ per perch for small, and 5*d.* per perch for main drains. The stones were quarried in a field in the demesne, and carted by the farm horses; the quarrying was done for $1\frac{9}{16}d.$ per perch, and the main drains were filled with stones that had been previously gathered on the surface. As in a former case, the account given is that of the money actually expended, which, therefore, makes no charge for the cartage. The price named for cutting the main drains, 5*d.* per perch, is more than that usually given, when they are filled with broken stones; but as it was necessary to cut a part of it through a knoll, to a very considerable depth, an extra price was allowed.

No. of acres in field.	No. of perches of small drains.	Price per perch.	No. of perches of main drains.	Price per perch	Total cost of field.	Cost per acre.
A. R. P.		*s. d.*		*s. d.*	£ s. d.	£ s. d.
5 1 20	894	0 4 1 1/16	533⅜	0 5	18 11 8	3 7 2

—*From the Irish Agricultural Society's Report.* [*To be continued.*]

Notices to Correspondents.

BURNET.—*Elysée.*—It is not a sufficiently large or luxuriant plant to supersede Lucerne, Sainfoin, or Clovers. It is a hardy plant, and keeps green all the winter. It is not particularly relished by cattle.

"CHITTAM," or "CHIDHAM" WHEAT.—*Kirklinton.*—Can any one give us the history of this variety?

DISEASES OF WHEAT.—*Brenchley*—Your curious specimen will, if possible, be noticed next week. You have got rain enough now, have you not?

DRAINAGE.—*E. B.*—We do not know of any test of tenacity or wetness of soil. 16 to 20 feet is ordinarily an efficient interval between drains. See where land of similar quality to your own has been successfully drained, and imitate the plan there adopted, in its essential features.

GRASSES.—*Eskdale.*—No. 1, Festuca pratense, Meadow Fescue; No. 2, Cynosurus cristatus, Crested Dog's-tail Grass; No. 3, not known, specimen imperfect; No. 4, a Festuca. Your ram should be fed on nourishing food of any kind. Are your Swedes ready yet? Give him some of them, and 12 to 16 ounces of oil-cake daily. We do not know the composition of the material sold by Biggs for dipping sheep.

GRASS-LAND.—*A Subscriber.*—Your proposed application of gypsum and farm-yard manure is good.

MODE OF CROPPING.—*C. J.*—Grow 1 acre of Lucerne, and of the other 12: you can have 4 acres of Carrots, 2 of Parsnips, 2 of Mangold Wurzel, 2 of Clover, and 4 of Wheat, of which 2 should be sown with Clover-seeds. The green crops will give you sufficient food, and the grain crop sufficient litter for your stock. You had better plough now in ridges, and sow 4 acres with spring Wheat, with 2 of which sow Clover, and, manuring sufficiently, you can cultivate the necessary green crops in spring.

NOTICES TO CORRESPONDENTS.—*J. Clark.*—We shall in part adopt your suggestion, and when the answer asked for is of general interest, state the question as well as answer.

SHEEP FEEDING.—*A Subscriber.*—The practice of house-feeding is extending, and we should be glad if our subscribers could give us their experience of it; we know of no work exclusively on this subject.

SHEEP-SALVE.—*A Subscriber.*—We know of no other evidence on the subject than that in the Highland Society's Transactions, which you appear to have seen. It appears to us sufficiently satisfactory.

TRANS. OF SOC. FOR ENCOURAGING ARTS, &c.—*J. S.*—We should be much obliged by extracts.

VALUE OF FOOD.—*Melibaus.*—You may safely consider the prices respectively of Foreign and British oilcake as accurately representative of their relative values as food. The experiments of foreign agriculturists indicate 100 lbs. of hay as being equal in value to 69 of oilcake. This appears to us incorrect; 1 lb. of oilcake is equal to two or three of hay.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, Oct. 14.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	10	to 4s	0	Best Downs & Half-breds	3s	8 to 4s 0
Best Short Horns	3	8		3	10	Best Long-wools	3	6		3	10
Second quality Beasts	2	8		3	4	Ewes and second quality	3	0		3	6
Calves	3	0		4	0	Pigs	3	4		4	0

Beasts, 3623; Sheep, 31,090; Calves, 118; Pigs, 378.

Our supply of Beasts is smaller, yet it is quite adequate to the demand; the best qualities, however, more readily realise our top quotations; the second class Beasts still form a large portion of the quantity in market, and meet with a very dull sale at about late rates. Sheep are less in number to-day; still, trade is heavy, owing to a general depression, although somewhat brisker than last week; we cannot notice any quotable advance, only that prices are more firmly supported, and in some few instances the best qualities make a trifle more money. Veal-trade is exceedingly heavy, except for the very best Calves, which are not very plentiful; the middling qualities make very low prices. Pork trade is steady.

FRIDAY, Oct. 18.

We have a large supply of Beasts, amongst which we notice several from Holland, in very good condition, and which meet a ready sale; good Beef being still a scarce article, prices remain about the same as on Monday for the best qualities; the middling, of which there is a large proportion, cannot be all sold. The supply of Sheep is small; we have a brisker trade, the best Downs, &c. making a little more than 4s, and Longwools 3s 10d per 8 lbs. Veal-trade continues very heavy; the best Calves make about 4s, but there is a large quantity of second rate from 3s to 3s 6d per 8 lbs. Pork-trade is rather brisker, at from 3s 4d to 4s 4d.

Beasts, 821; Sheep, 4250; Calves, 248; Pigs, 350.

41, West Smithfield.

POTATOES.—SOUTHWARK WATERSIDE, Oct. 14.

THE arrivals during the past week have been limited—yet there are some arrivals from most of the usual districts that supply this Market, but owing to the mildness of the weather, the demand is small, and our trade extremely dull at the following prices. One small cargo of FRENCH Potatoes are selling at—Blues, 45s; Whites, 40s.

York Reds	60s	to	80s	Kent and Essex Whites	50s	to	—s
Perth	60		—	— — Kidneys	—		—
Fifeshire	—		—	Wisbeach Kidneys	—		—
Early Devons	—		—	— Blues	—		—
Late Devons	—		—	— Whites	50		55
Cornwall	60		—	Guernsey Blues	50		—
Jersey Blues	50		—	— Whites	45		50
— Whites	45		60	Prince Regents	—		—

E. HANNAM.

COVENT GARDEN, OCTOBER 19.—The supply of fruits and vegetables during the week has been tolerably good, but trade has been somewhat dull. Pine-apples are rather scarcer than they were last week; they are also slightly advanced in price. Hothouse-grapes remain nearly the same as mentioned in our last Report. A few Spanish Melons are in the Market, and some of English growth are also to be met with; but they are getting very scarce. Of good dessert Pears there are plenty, and Apples are also pretty abundant. Impératrice and Golden Drop Plums are yet to be seen; but they are becoming scarce. Damsons are also scarce. Walnuts are plentiful, and a few Chesnuts are also supplied. Bitter Oranges are yet in the Market. Some good Specimens of Cucumbers are offered at about the same prices as quoted last week. Vegetables are, generally speaking, good in quality. There is an abundant supply of all kinds of Greens. A few French Beans may be met with, but they are getting very scarce. Turnips and Carrots are excellent in quality, as is also Celery; the red sort is a little dearer. Endive and Lettuces are well supplied. Jerusalem Artichokes are becoming more plentiful. Vegetable Marrow and Tomatoes have suffered from the cold nights, and are consequently scarce. Cut flowers chiefly consist of Sedum Sieboldii, Combretum purpureum, Camellias, Roses, Fuchsias, Pelargoniums, Neapolitan Violets, Picotees, and Heaths.

FRUITS.

Pine Apple, per lb., 3*s* to 6*s*
Grapes, Hothouse, p. lb., 1*s* to 8*s*
— Spanish, per lb., 1*s* to 1*s* 3*d*
— Portugal, per lb., 1*s* to 1*s* 6*d*
Melons, each, 1*s* to 3*s*
Figs, per dozen, 2*s* 6*d* to 4*s*
Peaches, per doz., 4*s* to 6*s*
Plums, per half-sieve, 2*s* 6*d* to 5*s*
— Imperatrice, per punnet, 1*s* 6*d*
— Coe's Gold. Drop, pun., 1*s* to 1*s* 6*d*
Damsons, per half-sieve, 1*s* 6*d* to 2*s* 6*d*
Apples, Dess., per bush., 2*s* 6*d* to 5*s*
— Kitchen, 2*s* to 4*s*
Pears, Dess., per hf.-sv., 2*s* to 8*s*
Quinces, per half-sieve, 2*s* to 4*s*
Filberts, per 100 lbs., 85*s* to 95*s*
Chesnuts, per peck, 5*s* to 8*s*
Walnuts, per bushel, 3*s* to 5*s*
— — shelled, 12*s* to 24*s*
Berberries, per hf.-sv., 2*s* 6*d* to 3*s* 6*d*
Oranges, bitter, per 100, 6*s* to 18*s*
Lemons, per dozen, 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Almonds, per peck, 6*s*
Sweet Almonds, per lb., 2*s* 6*d*
Cob Nuts, per 100 lbs., 90*s* to 95*s*
Nuts, Barcelona, 24*s*
— Brazil, 10*s*
— Cob, 16*s*

VEGETABLES.

Cabbages, per dozen, 6*d* to 1*s* 2*d*
Cauliflowers, per doz., 1*s* 6*d* to 4*s*
Broccoli, per bundle, 6*d* to 1*s*
Brussels Sprouts, hf.-sv., 1*s* 6*d* to 2*s*
Sorrel, per hf.-sieve, 6*d* to 9*d*
Artichokes, per doz., 2*s* to 4*s*
— Jerusal., p. hf.-sv., 1*s* 3*d* to 1*s* 6*d*
French Beans, hf.-sv., 3*s* to 5*s*
Scar. Runners, per hf.-sv., 1*s* to 2*s*
Potatoes, per ton, 50*s* to 70*s*

JAMES PEARIN, Wool Broker.

MARK-LANE, MONDAY, Oct. 14.

THERE was a fair supply of Wheat this morning from the home counties, a large proportion of which was of inferior quality; the trade opened heavily, and must be written 1*s.* per qr, lower for all descriptions, some quantity remaining unsold at the close. The transactions in Free Foreign were exceedingly limited, Millers evincing great unwillingness to comply with the present rates, which are firmly insisted upon. There is some demand for Bonded, for export to Holland and Belgium.—The finest samples of Malting Barley command an advance of 1*s.* per qr.; inferior and grinding are unaltered in value.—Peas of all sorts are 1*s.* dearer.—Beans rather a better sale.—The Oat-trade is firm at last week's prices.

FRIDAY, Oct. 18.

The arrivals of all descriptions of Corn since Monday have been small. The Wheat-trade continues dull, but prices are unaltered.—Canadian and American Flour meets a ready sale at our quotations.—96,553¾ qrs. Barley paid duty in this Port on Wednesday; this morning it met an improved inquiry, and a slight advance in the value is general, amounting on fine Malting qualities to 1*s.* per qr.—Beans and Peas are in good demand, and the turn dearer.—Oats are held for more money, but sales are difficult at an advance.

BROMPTON-PARK NURSERY AND SEED ESTABLISHMENT.—Established 1681.

MESSRS. GRAY, ADAMS, AND HOGG have much pleasure in directing the attention of their numerous customers to their extensive NURSERY STOCK, consisting of Dwarf and Standard Maiden and Trained Fruit-trees, Figs, Vines, &c. &c., all of which are this season of a very superior description, and will fully maintain the reputation this establishment has for such a long period of years enjoyed for producing these articles. The peculiar nature of the soil renders the removal of all ornamental trees and shrubs almost certain, of which there is a select and extensive collection; together with everything that is desirable in the class of Greenhouse and Herbaceous Plants.

MARKET GARDENERS are invited to inspect a fine stock of half standard Apples, Pears, and Plums, which they will find well worthy their attention.

The SEEDS of this season that have come to hand are generally of a very fine quality, and of which Catalogues will be issued in due course.—Kensington-road, October, 1844.

TENTH ANNUAL SALE OF DUTCH ROOTS.

MR. JAMES IZOD begs most respectfully to announce, that he will SELL BY AUCTION, at the Auction Mart, on TUESDAY NEXT, October 22, at Twelve for One, one CASE of very fine assorted DUTCH BULBS, comprising very fine named double and single Hyacinths, Narcissuses, Gladioluses, Ranunculuses, Anemones, Crocuses, Crown Imperials, Lilies, very fine Duc Van Tholl and other Tulips, Snowdrops, and other choice roots.

May be viewed the morning of sale, and Catalogues had at the Auction Mart, and of Mr. Izod, 2, Warnford-court, Throgmorton-street, City.

TO TULIP-GROWERS.

TO BE DISPOSED OF, 31 Rows, 7 in each, of fine TULIPS, the property of a gentleman deceased. They cost originally 120*l.* Selections of rows, or separate bulbs, may be had at half-price, or the whole Collection for 40*l.*—Apply for Catalogues, by letter, to A. B., Mr. Butten's Library, Clapham Common, where further particulars also may be learned personally.

CONICAL BOILERS.—The Boilers invented by John Rogers, Esq., are made of several sizes, and may be obtained of John Shewen, Ironmonger, Sevenoaks, Kent.

They may be seen in operation at Messrs. Chandler's, Vauxhall; Loddiges', Hackney; Henderson's, Pine-apple-place, Edgware-road; Rollisson's, Tooting; Pontey's, Plymouth; The Horticultural Society's Gardens, Chiswick; and in the Gardens of the Royal Botanical Society, Regent's-park.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orcidiaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

Burbidge and Healy respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, Burbidge and Healy refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. Glendinning, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ s.	s.	s. d.	s. d.	s. d.		
10	1 5	20	7 6	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.							
10	2 2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3 10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5 5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

COTTAM AND HALLEN, Engineers, Iron-founders, &c., &c., No. 2, Winsley-street, Oxford-street, London, and at Cornwall Road, Lambeth.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with Cottam's Patent or Rogers's Boilers. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for Agricultural and Horticultural Purposes.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
Wm. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Oct. 18, 1844.

WHEAT-SOWING.

GUANO; Genuine Peruvian, Bolivian, and Ichaboe, on Sale; also Potter's Guano, Gypsum, Sulphuric Acid, Sulphates of Iron and Copper, and all other manures. Synopsis of prices, and mode of use, on application, &c.—Apply to Mark Fothergill, 40, Upper Thames-street.

GUANO for SALE, in Bags of 1 cwt. each, just landed, with a succession of cargoes to arrive.—Successive years' experience has unquestionably proved that Genuine Guano is the simplest, cheapest, and best Manure within the reach of the Agriculturist. The only reasonable anxiety which now remains is to procure the Guano unadulterated, and to obtain such practical directions for using the Manure as shall fully develop its productive powers. To secure to buyers these indispensable requisites, with each purchase will be given a warranted chemical analysis of quality, and also a copy of the recently-published Pamphlet, "Practical Instructions for using Guano as a Manure, illustrated by Practical Results."

Large parcels will be delivered direct from the ship or waterside premises; smaller quantities may be had at the warehouses, 24 and 25, Billiter-street, or delivered within any reasonable distance at a trifling additional cost. Apply to James Clark, 24, Billiter-street.

TO COLONISTS, EMIGRANTS, &c. — Mrs. MARY WEDLAKE, widow of the late THOMAS WEDLAKE, at 118, Fenchurch-street, City, informs Emigrants and others that she continues to manufacture those Agricultural Implements for which her late husband was so extensively patronised by the Settlers of South Australia, Van Diemen's Land, Swan River, New Zealand, and other British Colonies. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, viz.:—

Patent Hay-making Machines	Flour-Mills—Bean-Mills
Dressing Machines	Patent Essex Ploughs, 30 sorts
Patent Chaff-cutting Machines	Subsoil Ploughs [Colonies
Oil-cake Crushers	Threshing Machines for the
Double action Turnip cutters	Drills of all kinds—Scarifiers
Railway Wheels	Vacuum Pumps.

Please to be particular in the address, Mary Wedlake, 118, Fenchurch-street, London.

POTTER'S GUANO MANURE is the only Guano that can positively be depended upon, and has stood the test of three seasons. The imported article, it is well known, is seldom twice alike, even when genuine, and is subject to a most extensive system of adulteration. Orders addressed early to the Works, 28, Upper Fore-street, Lambeth, will have instant attention. Testimonials will be sent per post, if required.

POTTER'S LIQUID GUANO may be had as usual of most Chemists and Seedsmen.

*** Beware of being imposed upon by inefficacious imitations.

MR. LAWES' MANURES.—Mixture for Wheat, 7*l.* per ton; Super-phosphate of Lime, 7*l.* per ton. To be had at the Factory, Deptford Creek, near London.

Super-phosphate of Lime, in a concentrated form, may also be procured at Messrs. Warner's, 28, Cornhill, in 7 lb. packets, price 1*s.*

WHEAT-SOWING.

FREDERICK BRAIN begs to call the attention of the Agricultural world to his GUANO MANURE, prepared expressly for Wheat crops: it abounds in all the ingredients that are necessary for a good grain crop. He particularly solicits persons who found the Foreign Guano a failure last season to give his a trial, it being much more powerful, and free from adulteration, so justly complained of in the Foreign by Agriculturists, as well as by all the leading Agricultural Journals.

Testimonial to Brain's Guano Manure.—"5 A, Hawley Road, Kentish Town, London, Aug. 15, 1844.—This is to certify that we have subjected Brain's Guano to a most patient and rigorous analysis, and find it contains all the necessary constituents of a good manure, and is well calculated to give fertility to a soil which is either naturally barren, or has been exhausted by over-cropping, by supplying the land with those substances which are absolutely requisite to a healthy vegetation. It is not adulterated, and can always be depended on, being of uniform composition.—Signed John Mitchell and Frederick Field, Analytical Chemists, late of the Royal Polytechnic Institution, London."

Also, Brain's highly-concentrated LIQUID GUANO, for Grass Lands, Gardens, Shrubberies, Hothouses, and Conservatories, price 1*s.* 6*d.* per quart bottle, with full directions for use, enough for 50 gallons of Liquid Manure, to be had of most respectable Florists, Seedsmen, and Chemists in town and country.

Works, Thomas-st., Duke-st., Stamford-st., Blackfriars-road.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. Mitchell and Field late Mr. Mitchell, Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No. 5 A, Hawley-road, Kentish Town.

DR. HALLETT'S DRY SOLUBLE FERTILIZER'S are, considering their power, the cheapest Manures in use, for they are entirely composed of the Phosphates and other Salts of Ammonia, and other acknowledged powerful fertilizers. They are fairly before the Public as tried things (see No. 33 of the *Gardeners' Chronicle*, &c. 56 cwt. of either has been found equal to nearly 30 tons of ordinary horse-manure. They are applicable to all sorts of field and garden crops. No. 1 for heavy top growth, as Corn, Hops, &c. No. 2 is for all roots, and a sure preventive of the Fly in Turnips. Price of each, 10*l.* per ton, or 12*s.* per cwt.

Dr. Hallett's Concentrated Liquid Fertilizer is extensively used by Gardeners for improving the size and flavour of fruits and vegetables, and the colours, and perfecting the seed of flowers. Sold in quarts at 1*s.*, and in bottles, six times the size, at 7*s.* 6*d.* Each quart requires 32 gallons of water, to reduce it for use.

Agents for the above. London—Mr. Fothergill, Thames-street; Mr. G. Hallett, the Factory, Broadwall, Blackfriars; Messrs. Winstanly, Poultry; Pace and Co., St. Peter's Alley. Norfolk—Bullard and Watts, Norwich. Suffolk—Mr. W. Revans, Yoxford. Leicester—Mott and Co. Gloucestershire—Mr. Betterton, Fairford. Devonshire—Mr. Seward, Plymouth. Wilts—Mr. G. King, Devizes. Glasgow—Mr. J. T. Jackson, Hartlepool. Sunderland, Stockton, and Newcastle—Pace and Co. Dundee—Green and Co. Further respectable Agents wanted.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN BASINS IN IRON, &c. 70, STRAND, LONDON.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d* per foot, super. A discount to the trade.
Thos. J. Croggon, 8, Ingram-court, Fenchurch-st., London.

TO LANDOWNERS, AGRICULTURISTS, BUILDERS, &c.

McKIBBIN'S Improved ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY.

The disadvantages attending other materials used in roofing, preventing, to a great extent, many useful houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will in a great measure—and in some instances altogether—obviate them, and prove most serviceable from its lightness, durability, and impermeability to water and damp, in covering Houses, Cattle-sheds, Workshops, Ropewalks, &c., and for the sides, as well as roofs, of light structures for plants, being likewise a non-conductor of heat; besides its economy in repairs, the timber where it is used may be so light as to save its whole expense; it requires no other coping, and may be applied by any person of common ingenuity; being flexible and portable also, it is free from breakage, the expense of carriage is inconsiderable in comparison with slates, tiles, &c., and it is not liable to contraction like zinc.

Sold in sheets 32 inches by 20, at 7*d.* each being less than 9*s.* 6*d.* per square of 100 feet, with printed directions for applying them, same as adopted at the Government Dock-yards and various other public buildings.

Orders will meet with prompt attention if addressed to H. C. Bowden, 18, East India Chambers, Leadenhall-street, London, or to the following agents:—Liverpool, Messrs. Grueber & Co., 11, Manesty-lane; Plymouth, Thomas Stevens, Esq.; Birmingham, William R. Loyd, Esq.; Sunderland and Newcastle-on-Tyne, Messrs. John Ritson and Sons; Hull, William Ward, Esq.; Bristol, Messrs. Moor and Hewitts; Ramsgate and Deal, Messrs. Edward Hodges & Co.; Whitehaven, William Todd, Esq.; Glasgow, Malcolm Carmichael, Esq., St. Enoch-square, Cork, Messrs. Richard Wallis & Co.; Belfast, Messrs. Grueber & Co., Dunbar's Dock; who have also on sale McKibbin's improved SHEATHING, BOILER, RAILWAY, and other FELT.

*** The "Improved Roofing Felt" will be found much more durable than the Common Felt made in lengths, and not subject, like it or continuous sheets of other material, to be stripped by storm; it can also be more easily repaired, and from the simple mode of application recommended, the wet cannot percolate through nail-holes, being only fastened down at the overlaps.

THE WORKS OF G. P. R. JAMES, ESQ.

On the 1st October was published the second volume of the NEW and ILLUSTRATED EDITION of Mr. JAMES'S WORKS, comprising the whole of the celebrated Historical Narrative entitled

MARY OF BURGUNDY.

This new and attractive series commenced on the 1st July with "THE GIPSY" (of which a second edition has already been required). The future Volumes will be published quarterly, each containing a complete Work, price only 8s. (originally published in three volumes at 31s. 6d.) The whole of this Edition has been carefully Revised by the Author, and "is got up in that superior style and agreeable size of type, &c., which render it fit for every age and for every library."

London: SMITH, ELDER, and Co., 65, Cornhill, and may be had of every Bookseller in the Kingdom.

Price Sixpence, free by post Sevenpence.

The Lancet,

Of Saturday last, October 12, contains:—

A COURSE of LECTURES on the OPERATIONS of SURGERY, and on Diseases and Accidents requiring Operations, by ROBERT LISTON, Esq. (Lecture IX.):—Diseases of the Velum—Abscess—Enlargement of the Tonsils; removal—Enlargement of the Uvula—Ulceration of the Tonsils and Velum—Gum-boils—Fungous Growth of the Gums—Epulis.

SUGGESTIONS TOWARDS AN INQUIRY into the PRESENT CONDITION of the LABOURING POPULATION of SUFFOLK. By the Rev. J. S. Henslow, M.A., Rector of Hitcham, and Professor of Botany in the University of Cambridge.

"Much food is in the tillage of the poor: but there is that is destroyed for want of judgment."—Prov. xiii. 23.

Also, by the same Author,

LETTERS to the FARMERS of SUFFOLK. Price 2s. And SERMONS on IMPROVED ATTENTION to the SACRAMENTS. Price 1s.

J. W. Parker, West Strand, London.

In 4to, with large Chart, and Steel-plate, Coloured Maps of England, Wales, and Scotland, price 4s.; or without Maps, 3s.

LITERARY LEAVES; or, Prose and Verse. By DAVID LESTER RICHARDSON.

2 vols. 8vo, Second Edition, price 12s.

"We strongly recommend this second and enlarged edition. We can easily imagine how such writings as these, appearing from time to time in the Indian journals, must have gratified the English residents, since even here, in the midst of lions and new books, we run over the leaves with unmixed pleasure."—*Atlas.*

"His poetry derives from his unfeigned attachment to home, a very touching beauty. Most persons who have been long absent from the place of their birth know how delicious is the feeling with which it is approached. Mr. Richardson describes this feeling with exquisite truth and tenderness .... Whatever forms of nature challenge his preference, he views them all with a poetical eye, and paints them in his verses with vividness and fidelity. We should be glad to see the poetry of these volumes detached from the prose, and sent into the world alone. It has sufficient character in it to depend on its own vitality; and we venture to predict that it will live."—*Sunday Times.*

"The essays afford some exquisite reading. We can with perfect confidence refer every man of literary taste to these volumes, which we consider an elegant and valuable contribution to the literature of our country."—*Indian News.*

"The poems are largely impregnated with Nature's best and holiest feelings. They are utterances of the writer's own heart, and they reach the hearts of his readers. They leave an impression which will not be easily or speedily effaced. The diction is in keeping with the sentiments; it is at once accurate and graceful. The same observation applies to the author's prose writings."—*Observer.*

Smith, Elder, and Co., Cornhill, London.

MR. HOARE'S NEW WORK ON THE VINE.

Just published, 12mo, 5s. cloth,

A DESCRIPTIVE ACCOUNT OF A NEW METHOD OF PLANTING AND MANAGING THE ROOTS OF GRAPE-VINES. By Clement Hoare, Author of "A Treatise on the Cultivation of the Grape-Vine on Open Walls."

"Mr. Hoare maintains that the system of English Grape-growing requires to be changed. His arguments deserve very serious attention, and cannot fail to lead to most important changes in the cultivation of the Vine."—*Gardeners' Chronicle.*

London: Longman, Brown, Green, and Longmans.

ILLUSTRATED GARDEN ALMANACK.—Price One Shilling. Published by F. C. Westley, 163, Strand, on the usual day for Almanacks. Advertisements cannot be received after the 25th. Smallest, 10s.; Quarter-page, 15s.; Half-page, 25s.; Whole page, 2l. 2s.

ELEMENTS OF PRACTICAL AGRICULTURE.

THE BREEDS OF THE DOMESTICATED ANIMALS OF GREAT BRITAIN. 2 vols., 4to., with 56 coloured Plates, 16l. 16s.

London: Longman, Brown, Green, and Longmans.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and Obtained the Prize for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price Only One Penny per Square Foot.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Buildings, Bunhill-row, London.

DRAWING-ROOM CLOCKS.—A. B. SAVORY and SONS, No. 9, Cornhill, London, opposite the Bank of England, invite attention to a splendid variety of Rosewood, China, Bronze, and Ormolu CLOCKS; they go for eight days and strike the hours and half-hours. Price 4 guineas, 7 guineas, and 10 guineas each, and upwards. The performance is warranted.

A Pamphlet, with detailed lists of Prices, and illustrated with sketches, may be had on application gratis, or sent to all parts of Great Britain and Ireland, postage free, in answer to a post letter.

TERRA COTTA FIGURES, VASES, FOUNTAINS, &c. Manufactured by DOULTON and WATTS, Lambeth Pottery, High-street, Lambeth, London.

D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, the superiority of which over Artificial Stone or Cement is well known. It is subjected to a high degree of fire, which renders it imperishable, and gives it a sharpness and surface which no changes of temperature can impair.

D. and W. are enabled to offer the Terra Cotta at a considerable reduction in price; and Drawings and Designs will be forwarded Gratis, on application.—Architectural work executed.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with Lea & Perrins's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) James Hosken."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette,* April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. Lea and Perrins, Worcester; Messrs. Barclay and Son, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

REAL SHEFFIELD PLATED DISH COVERS, at prices hitherto unattempted. THOMAS WEST, 18, Ludgate-street, London, having received a large supply direct from the manufactory at Sheffield, offers the best Meat Dish Covers as follow:—Cottage Pattern—1 Cover of 20 inches, 3l. 1s.; 1 do. of 18 inches, 3l. 3s.; 2 do. of 14 inches, 4l. 8s.; the set of 4, complete, 11l. 10s. ONLY. Double Dome Pattern—1 Cover of 20 in., 4l. 16s; 1 do. of 18 inches, 3l. 19s.; 2 do. of 14 inches, 5l. 5s.; the set of 4, complete, 14l. ONLY. In noticing the prices of the above goods, T. W. ventures to assert they are superior to many advertised at a much higher price. Best Wrought Silver Spoons and Forks as usual, Fiddle Pattern, 7s. 2d. per oz.; Queen's Pattern, 7s. 4d. per oz. Superior Watches and Fine Gold Jewellery, cheaper than any house in London. West's Hand-book, with 100 engravings, and full of useful information, is just published, and may be had gratis, and post free, on application to T. West, Silversmith, 18, Ludgate-street, London.

H. WALKER'S NEEDLES (by Authority the "Queen's Own") have large eyes, easily threaded, (even by blind persons), and improved points, temper, and finish. Each paper is labelled with a likeness of Her Majesty or His Royal Highness Prince Albert, in relief, on coloured grounds. Every quality of Needles, Fish-hooks, Hooks-and-eyes, Steel Pens, &c., for shipping. These Needles or Pens for the home trade are sent free, by post, by any respectable dealer, on receipt of thirteen penny stamps for every shilling value.

H. Walker, manufacturer to the Queen, No. 1 (late 20), Maiden-lane, Wood-street, London.

STOOPING of the SHOULDERS and CONTRACTION of the CHEST are entirely prevented, and gently and effectually removed in Youth, and Ladies and Gentlemen, by the occasional use of the PATENT ST. JAMES'S CHEST EXPANDER, which is light, simple, easily employed outwardly or invisibly, without bands beneath the arms, uncomfortable constraint, or impediment to exercise. Sent per post, by Mr. A. Binyon, 40, Tavistock St, Strand, London, or full particulars on receiving a postage stamp.

Printed by William Bradbury, of No. 6, York-place, Stoke Newington, and Frederick Mullett Evans, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, October 19, 1844.

The Newspaper.

SATURDAY, OCTOBER 19, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—*Trustees.*—Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

LIFE ASSURANCE AND ANNUITIES.

THE following are specimens of the low rates of Premium charged by the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY.

Age.....	20	30	40	50	60
Ann. Prem.	£1 10 3	£2 0 7	£2 15 3	£4 1 8	£6 3 9

and of these Premiums one-third may remain unpaid in the hands of the Assured, at interest to be deducted from the sums assured, when they become claims.

Peculiar facilities are afforded for the assurance of the lives of persons proceeding to or residing in Australasia and the East Indies.

Immediate and Deferred Annuities are granted by the Company, on very favourable terms, and it is a peculiar feature in its constitution, that Annuitants participate in the profits.

DIRECTORS.

E. Barnard, Esq., F.R.S. | Gideon Colquhoun, Esq.
Robert Brooks, Esq. | C. E. Mangles, Esq.
Henry Buckle, Esq. | Richard Onslow, Esq.
John Henry Capper, Esq. | William Walker, Esq.

SECRETARY.—E. RYLEY, Esq.

For Prospectuses and other Particulars apply at the Offices, No. 126, Bishopsgate Street, corner of Cornhill.

LONDON, EDINBURGH, and DUBLIN LIFE ASSURANCE, 3, Charlotte-row, Mansion-house, and 18, Chancery-lane, London.

The more than usual success which has attended this Company has arisen—

From the combination of advantages formerly obtainable partly from proprietary and partly from mutual societies, thereby affording to the assured bonuses, reduction of future premiums, and complete freedom from responsibility.

From the indisputability of the policies, leave to travel beyond Europe, the option of payment of one-half the premiums for the first years, and immediate settlement of claims.

Prospectuses and rates forwarded by the Agents and Manager. ALEX. ROBERTSON, Manager.

NORTH BRITISH INSURANCE COMPANY, Established 1809. His Grace the Duke of Sutherland, K.G., President; Sir Peter Laurie, Alderman, Chairman of the London Board; Francis Warden, Esq. (Director H.E.I.C.), Vice-Chairman; John Webster, M.D., F.R.S., 24, Brook-street, Physician.

THIRD DIVISION OF PROFITS.

The Third Septennial Investigation of the Company's Affairs will take place on the 31st December next. Parties joining the Profit Scheme in the interim, will participate in the Bonus to be then declared.

This Institution is incorporated by Royal Charter, and is so constituted as to afford the Benefits of Life Assurance in their fullest extent to Policy Holders, combined with perfect security, in a fully subscribed Capital of One Million Sterling, besides an Accumulated Premium Fund, exceeding Four Hundred Thousand Pounds, and an Annual Revenue of Eighty-seven Thousand Pounds.

Fire Insurances may be effected on Private Houses, Country Mansions, &c., at the lowest rate of Premium.

A Prospectus, containing Tables of Premiums, with the names of the President, Vice Presidents, Directors, and Managers, who are all responsible Partners, may be obtained of Messrs. B. and M. BOYD, 4, New Bank Buildings, or of the Actuary, 10, Pall-Mall East.

JOHN KING, Actuary.

INTERESTING TO LADIES. — To MESSRS. ROWLAND & SON, 20, Hatton Garden, London.—"Percy Place, Landport, Portsmouth, April 4, 1844. GENTLEMEN,—I think it but an act of justice to inform you of the benefit I have derived from the use of your admirable Macassar Oil. About six months ago I found my hair getting daily more weak and thin, and much discoloured from a practice I had adopted of wetting it continually; fearing that I should lose it entirely, and hearing of the efficacy of your Macassar Oil, I have for some time past constantly used it, and the result is, that my hair is now perfectly restored and much improved in appearance and colour, having become thick, dark and glossy; it also curls freely without the use of paper, which it never did before. To all my friends I have warmly recommended your Macassar Oil as an excellent restorative and preservative for the Hair. As I have an objection to see my name in print, I beg you will not publish it; but you are at liberty to show this letter, or make any other use you please of it, and refer applicants to me if necessary, in proof of the efficacy of your Macassar Oil. Your Obt. Servant *"

ROWLAND'S MACASSAR OIL preserves and reproduces the Hair; prevents it from falling off or turning Gray; changes Gray Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

*** Ask for "ROWLAND'S MACASSAR OIL." All others are Fraudulent Counterfeits.

News of the Week.

THE departure of the King of the French, although attended by a series of unforeseen adventures, and accomplished at last amidst fires and tempests, took place on Tuesday morning from Dover, to which place His Majesty was driven by a severe storm, which rendered a voyage from Portsmouth to Tréport dangerous if not impossible. The strange chapter of accidents which attended His Majesty's movements, from his arrival at Portsmouth on Monday afternoon to his departure from London about midnight, while the railway station was in flames, contrasts curiously with the hearty greeting which welcomed His Majesty at every stage of his progress, and supplies abundant proof that the cordiality of his welcome was not confined to the official authorities of Portsmouth or the courtly circles of Windsor. The King left these shores amidst such manifestations from the inhabitants of Dover as must have convinced him that his visit was regarded as a national event, and that he carried with him the cordial good wishes of all classes in this country. The Paris Opposition Papers, however, still adopt the same unworthy vituperation of Great Britain, and the same strain of hostility towards their Sovereign, in which they have so long indulged. The proceedings at Windsor are perverted to suit their purpose, and the tact which the Queen had shown to avoid the slightest occasion to awaken in the mind of the King or his officers any reminiscence of our past disputes with France is so far forgotten, that an imaginary Banquet in the Waterloo Chamber is gravely put forth as another insult to the French people. The Ministerial Papers protest earnestly against this perversion of facts: they state with truth that no banquet has been given in the Waterloo Chamber during the King's visit, and express in courteous terms their gratitude to the Queen for her splendid hospitalities, and for those really royal attentions in which, as they say, the delicacy and grace of the female character vied with the dignity and nobility of the Sovereign of a great nation. They regard the welcome of the English people, and especially the unprecedented compliment paid to the King by the Corporation of the city of London, as events of exciting interest, and of a political importance which cannot be mistaken; and they express their belief that "France—liberal, enlightened, and emancipated France—will see with pride the marks of respect bestowed on her Sovereign by the citizens who enjoy the highest degree of liberty in the world, and will respond with profound sympathy to the affectionate and noble sentiments which have been expressed for the French people as well as for their King."—From Spain we learn that the Cortes were opened on the 10th inst. by the Queen in person. The speech from the throne is confined chiefly to diplomatic and financial matters; and although unusually long, it contains few topics which would interest our readers beyond the compliment paid to our Government for effecting a termination of the disputes with Morocco, and the announcement of a constitutional reform, as one of the first measures of the Session.

At home there are few topics of political interest to call for notice beyond the rumour that M. Guizot has availed himself of the King's visit to obtain a modification of the right of search, and that Sir R. Peel has obtained in return the abandonment of Tahiti and a revision of the French tariff in our favour.—The Repeal agitation has assumed another aspect in consequence of Mr. O'Connell's declaration that he now prefers Federalism to Simple Repeal. By this step he hopes to enlist a large number of Protestants and Liberals in his favour, and the Irish Whig organs already hint that the struggle for office in the next session of Parliament will be fought on the question of Federalism.—The Queen during the week has been enjoying a residence in the Isle of Wight, and it is rumoured, on somewhat doubtful authority, that if the weather be propitious, Her Majesty will honour Ireland with a visit in about three weeks.

Home News.

VISIT OF THE KING OF THE FRENCH.—Our account of the King's visit in our last Number was complete to Thursday night. On Friday morning His Majesty, surrounded by his whole suite, received an Address from the Mayor and Corporation of Windsor, and returned the following remarkable reply:—

"Mr. Mayor, Aldermen, and Burgesses of the borough of Windsor—I feel most grateful to Her Majesty Queen Victoria for having permitted you to present this address to me. I receive it with the most cordial thanks, impressed with the kind reception I have met with from all classes of Her Majesty's subjects since my arrival in this country. I was most happy last year to perceive the sentiments of the French people, when Her Majesty favoured me with a visit at Eu. I was most happy to entertain Her Majesty under my own roof on that occasion, and rejoiced at the interchange of social feelings which then took place. The union of France and England is of great importance to both nations, not from any wish of aggrandisement, however. Our view should be PEACE, while we leave every other country in the possession of those blessings which it has pleased Divine Providence to bestow on them. Happy I am that you appreciate my constant endeavours, assisted by a wise Government at home, to promote the most friendly and peaceful relations between the two countries. France has nothing to ask of England, and England has nothing to ask of France, but cordial union. I thank you for this very kind address, and I consider it a privilege that I have had the good fortune to express before you the sentiments with which my heart is filled."

This reply was spoken by His Majesty with marked emphasis and feeling, particularly when alluding to the advantage of maintaining peace between the two countries. We may here observe that His Majesty has several native artists engaged in making copies of some of the celebrated pictures in Her Majesty's gallery at Windsor. These gentlemen, during the King's visit, have been employed in taking sketches of the most interesting scenes passing within the Castle. One artist was busy on Friday in sketching the scene just described, from an adjoining corridor. His Majesty, with the Queen and Prince Albert, accompanied by a large number of the guests in the Castle, visited the new gardens at Frogmore during the morning, and inspected, among other objects, the magnificent pinery recently erected. The royal party returned by the road, and were enthusiastically cheered as they entered the Lodge-gates. In the afternoon the Queen held a chapter of the Order of the Garter, to invest King Louis-Philippe with the insignia of the Order. The Knights present were, Prince Albert, the Duke of Cambridge, Duke of Rutland, Duke of Wellington, Marquis of Anglesey, Duke of Devonshire, Marquis of Exeter, Duke of Buccleuch, Marquis of Lansdowne, Marquis of Westminster, Duke of Beaufort, Duke of Buckingham, and the Marquis of Salisbury. The usual forms having been gone through, the King of the French was conducted to the Chapter Room by Prince Albert and the Duke of Cambridge, preceded by Garter King-at-Arms. His Majesty was received by the Queen and the knights standing, and was seated in a chair of state on the right hand of Her Majesty. The Queen then announced to His Majesty that he had been elected a knight of the Most Noble Order of the Garter. Garter, kneeling, presented the garter to the Sovereign, and Her Majesty, assisted by Prince Albert and the Duke of Cambridge, buckled it on the left leg of the King, the Bishop of Oxford, as Chancellor, pronouncing the admonition. Garter next presented, in like manner, the riband with the George, and the Queen, assisted as before, put the same over the left shoulder of the King, the Chancellor pronouncing the admonition. Her Majesty thereupon gave the *accollade* to the King of the French, and His Majesty received the congratulations of each of the Knights present, passing round the table and shaking hands with each. The whole of His Majesty's suite were present at the ceremony, with the Queen's suite and the principal officers of state. All the Knights were in Military costume, either in the uniform of their respective regiments or as Lords Lieutenant of counties, and in addition wore the magnificent robes and insignia of the Order. The jewellery worn by the Marquis of Westminster was of the most superb character. In the centre of his Lordship's badge was the celebrated Arcot diamond, valued at 15,000 guineas, and his Lordship's sword also displayed a massive diamond, one of the largest in the world, weighing 96 carats, and valued at 20,000*l*. The King was dressed in a uniform of dark blue, with gold epaulettes and appointments. The Queen appeared in the Mantle of the Order of the Garter, wearing the motto, "Honi soit qui mal y pense," as a bracelet. Her Majesty also wore her diamond tiara. A banquet in honour of the occasion was given by the Queen, in St. George's Hall, in the evening. The entertainment was served with unusual splendour, to upwards of 100 guests, including all the Knights of the Garter who had assisted at the investiture, together with the royal visitors, the officers of the Order of the Garter, and a large party of the nobility and gentry, including several Cabinet Ministers. On Saturday morning, the Duc de Montpensier left Windsor by the Great Western Railway for Woolwich, and minutely examined the several departments of the Royal Arsenal, returning to the Castle in the afternoon. In the course of the morning, a deputation of the French Benevolent Society, headed by M. Durand St. André, French Consul-General, had an audience of His Majesty; after which, the King received the Lord Mayor and Corporation of London, who presented an address of congratulation. The Lord Mayor, sheriffs, and aldermen, appeared in state for the occasion, and the King was attended by all his suite in full uniform. The Recorder having read the address, His Majesty replied as follows:—

"My Lord Mayor, Aldermen, and Commons of the City of London.—I receive with heartfelt satisfaction the address of congratulation which you have just presented to me by the gracious authorisation of your beloved Sovereign. In coming to offer to the Queen of these realms a proof of the sincere and unalterable friendship I bear to Her Majesty, I am happy to find that the City of London—that illustrious city which holds so prominent a place in the world, and which represents interests of such magnitude—is coming to this royal residence to manifest to me sentiments so perfectly congenial to my own feelings and to the sense I entertain of my duty towards my country, towards Europe, and towards mankind. I am convinced, as you are, that peace and friendly relations between France and England, are for two nations made to esteem and honour each other, a source of innumerable and equal advantages. The preservation of that good understanding is at the same time a pledge of peace to the world at large, and secures the tranquil and regular process of civilisation for the benefit of all nations. I consider my co-operation in this holy work, under the protection of Divine Providence, as the mission and honour of my reign. Such has been the aim and the object of all my efforts, and I trust that the Almighty will crown them with success. I thank you in the name of France and in my own, for this manifestation of your sentiments. They will be fully appreciated in my country, coupled as they are with the many tokens of friendship which I have received from your gracious Sovereign. I thank you most cordially for your kind feelings towards myself and my family. The impression produced upon me by the presentation of your address will never be effaced from my heart."

His Majesty afterwards passed round the circle formed by the deputation; the Lord Mayor presenting all the aldermen individually to the King. The King shook hands cordially with the Lord Mayor. "I well remember your father, Mr. Magnay," said His Majesty. "I had the happiness of seeing him in the Egyptian Hall of the Mansion House, when he filled the high situation which you now hold. I remember him with much pleasure, and the hospitable manner in which he received me." The Lord Mayor, in acknowledging the compliment with which His Majesty honoured him, said he hoped His Majesty would be graciously pleased to visit the citizens of London, either at the Mansion House or at Guildhall, before his departure. "I assure you," replied the King, "that if I had time, etiquette should not interfere with my hearty wish, but my time is limited. I should wish

very much to visit Guildhall, the Mansion House, and Fishmongers' Hall." The Lord Mayor having expressed his gratification at hearing His Majesty express himself so cordially about places of such favourite resort to his fellow-citizens, the King said, laughing, "Why, Magnay, I know all the wards in the city of London as well as you know them." The King then recognised the Recorder, and, shaking hands with him, said, "Ah! Mr. Law, I am happy to see you. I well knew Mr. Thomas Law, an uncle of yours, in America. He was married to a granddaughter of General Washington." Some amusement was caused by a mistake which the King made when Sir Claudius Hunter was presented to him. "Ah, Sir Peter Laurie," cried His Majesty, "I am happy to see you. I have heard and read a great deal about you." Immediately afterwards, His Majesty observing Mr. Moon, the mover of the address, took him by the hand, and said, "Ah, Mr. Moon, I know you perfectly. I have heard of your encouragement of the arts, and I have derived great pleasure from the examination of your admirable engravings. I find, too, that you have an excellent way of making speeches." The King probably alluded to the speech made by Mr. Moon in proposing the address in the Court of Common Council on Thursday. His Majesty then addressing the Lord Mayor, said he hoped his Lordship would do him the honour to sit for his portrait, which he desired to hang among his pictures at Versailles. In the afternoon His Majesty, and the Queen and Prince Albert, paid a visit to Eton College, and were received with tumultuous cheers by the 700 boys now in the establishment. After inspecting the different apartments of the College, the royal party proceeded to the library, and wrote their names in the visitors' book. The King also asked for a holiday for the boys, and promised to send his bust for the College Library. In the evening another splendid banquet was given in St. George's Hall, at which 88 persons were present. On Sunday His Majesty attended high mass at the Roman Catholic Chapel at Clewer, and was loudly cheered on his way to and from the chapel. In the course of the afternoon many hundreds of persons arrived from town by the different trains in order to see His Majesty. The unfavourable state of the weather disarranged the plans of the royal party, but about 4 o'clock, the Queen, accompanied by the King of the French, Prince Albert, the Duke de Montpensier, and a numerous suite, walked on the Eastern terrace, and were loudly cheered. The dinner party in the evening included, in addition to the usual suite, Lord Melbourne, Lord J. Russell, Lord and Lady Beauvale, Lord Ellenborough, Sir R. Peel, and Lord Aberdeen. On Monday, at 12 o'clock, His Majesty left Windsor Castle for Portsmouth, accompanied by the Queen and Prince Albert, proceeding by Bagshot to the Farnborough station of the South Western Railway. The royal party were met at the station by a special train from London, bringing despatches of importance for the King of the French, which had arrived in town in the morning. The weather was most unfavourable for the journey, and on arriving at Portsmouth, the wind was blowing a gale, the sea running very high, and the rain falling in torrents. At the terminus at Gosport the royal party were received by the Duke of Wellington, who had remained all day about the terminus; and by Sir Hercules Pakenham, the commander of the garrison, who went through the usual ceremony of presenting his royal mistress with the keys of the garrison, which were immediately returned, with a few gracious words, by Her Majesty. The royal party then, amid general cheers and cries of *Vive le Roi*, mounted the carriages waiting to receive them. Notwithstanding the tempestuous state of the weather, the appearance of the royal party at the gates of the terminus, as they passed through the triumphal arches, was the signal for a tremendous burst of cheering. The troops had some difficulty in preserving their order, so dense was the crowd, and so determined the rushes made on every hand, for the doubly attractive sight of Louis-Philippe and Queen Victoria. The royal party drove to the office of the captain superintendent of the Clarence Victualling-yard, and there alighted, the weather being so bad that it was thought imprudent to attempt going on board at that period. In consequence of the state of the tide the King's steamer Gomer had gone out to Spithead some hours previously, and on a consultation of naval officers, it was unanimously agreed that to go on board that evening, with the sea rolling as it then did, would be attended with the highest difficulty and danger. The rain, which had all along fallen heavily, now increased to a perfect torrent. The wind blew a hurricane, and the rumbling of thunder in the distance succeeded faint flashes of lightning, which gave promise of a stormy night. To cross from Spithead to Tréport, under any circumstances, would be attended with immense loss of time in such tempestuous weather, and the coast at Tréport is so exposed that landing might have proved impossible. The Duke of Wellington having joined the consultation, it was instantly determined to despatch a special train to London, in order to secure the necessary accommodation for His Majesty's departure for France *viâ* Dover. Colonel Bouverie was intrusted with this duty, and the Duke of Wellington accompanied the Colonel to town. The Queen and Prince Albert then determined to pass the night on board the Royal yacht, which remained at her moorings opposide the Victualling-yard, but as it was necessary that the express train, conveying Colonel Bouverie, should precede the King by three hours, in order to allow time to make arrangements for the route, the royal party determined to spend the interval in the residence of Mr. Grant, the storekeeper, who occupies a house on the left of the entrance yard, where they were received in the best manner which the absence of all preparation would allow. Her Majesty and the Prince, with the King of the French and the Duke de Montpensier, occupied a small parlour looking into the dockyard, where they partook of a hasty *déjeúner*, the suite occupying an adjoining apartment; and here the royal party remained until half-past 7, when the Queen took leave of the King of the French in the most affectionate manner, His Majesty entering one of the carriages in attendance, and proceeding direct to the railway station. The train left Gosport shortly before 8, and arrived at Vauxhall about half-past 10, when Sir James Graham was in attendance to receive His Majesty. The King and his suite immediately proceeded in the Queen's carriages, which were in waiting, to the New Cross Station of the Dover Railway, escorted by a troop of Horse Guards, and arrived there at the moment when the destructive fire described in another part of our Paper was at its height. Although the chief portion of the station was enveloped in flames, the preparations for the King's departure were completed just as His Majesty arrived, at 11 o'clock, and in less than five minutes the special train started for Dover, as though nothing unusual had taken place. His Majesty expressed his hearty sympathy with the authorities for the destructive calamity which had befallen them, and hoped that they were well insured. The King reached Dover at ¼ past 2 on Tuesday morning, and was received at the Ship Hotel by Colonel Jones, commandant of the garrison, and the commanders of two of H. M.'s steam-vessels in the harbour, all of whom were invited by His Majesty to join him and his suite at supper, which was served soon after 4. His Majesty retired to rest about 5 A.M., having previously despatched the Myrtle steamer with letters for the authorities at Calais. At daylight a royal salute from the Castle announced the intelligence of the King's arrival to the astonished inhabitants of Dover. The King rose at 9, and at half-past 10 received the Mayor and corporation of Dover, who had lost no time in preparing an address to His Majesty. The King returned a gratifying answer to the address, and on being asked for a copy, in order that it might be enrolled among the minutes of the corporation, His Majesty expressed his regret that he had no copy; but observing a gentleman present with a note-book in his hand, His Majesty inquired if he was there in connection with the press. On being informed that he was the reporter of the *Morning Chronicle*, the King expressed a desire to revise the copy of his speech, and corrected the sentence in reference to the feelings evinced towards him by all classes in this country by the following words printed in italics:—"They give me a favourable opportunity of manifesting towards *your country* those sentiments of amity, *so essential to the maintenance of peace, and to those good understandings between the two countries which have ever been the aim and object of my policy.*" The King then conversed affably with the deputation, and approaching some ladies who had been admitted into the room to witness the ceremony, His Majesty thanked them cordially for their attendance. His Majesty then breakfasted, and soon after 11 proceeded on foot to the French mail steamer Le Nord, amidst the cheers of the people who had assembled on the piers. The rain was falling heavily, but His Majesty walked uncovered nearly the whole way, acknowledging in the most courteous manner the repeated cheering of the crowd. The steamer immediately left the harbour under a royal salute from the Castle, followed by the Princess Alice and two other steamers conveying the baggage and some members of the suite. The King remained on deck until his vessel, with her convoy, were about mid-channel, when the tremendous gale, blowing from the S. W., compelled His Majesty to go below until he arrived at Calais, at 5 minutes past 2, where he was received by a salute from the fort. The authorities were waiting to receive His Majesty at the pier, and conducted him at once to the royal carriage, which was in waiting to carry him to the Château d'Eu, where it was expected that His Majesty would arrive at an early hour in the evening. In the meantime one of the King's suite had reached Eu from Windsor, to announce that His Majesty would arrive on Tuesday in the Gomer, and the necessary preparations were accordingly made for his reception. During the night a tent was erected at the entrance of the pier of Tréport for the accommodation of the Queen, while she would be waiting the landing of His Majesty, and as some uncertainty still prevailed as to the hour at which he was to embark, the steam-packet La Poste was ordered out into the roads. At 7 in the morning all the troops of the garrison were under arms, and marched to Tréport, where they found the Custom Officers and National Guard of the place already under arms, and drawn up along the quay. Soon afterwards the entire population of Eu turned out, the weather having become extremely fine. During the preceding two days it had been rainy and tempestuous. On Monday in particular it blew a regular hurricane. The fishermen of Tréport, with few exceptions, were afraid to venture out of the harbour, and one of those which put to sea was thrown a wreck on the coast. It was only at 5 A.M. that the wind subsided and turned to the west, but it was the universal opinion of the seamen of Tréport that the weather must have been still worse on the coast of England, and that the King either did not embark or must have proceeded to some other point of the coast. Great was accordingly the astonishment, when at 9 o'clock, the coming of one of the vessels of the royal squadron was semaphored from the top of the cliff of Tréport. A red flag was hoisted to convey the intelligence to the Château, and in the course of half an hour the vessel could be distinctly seen with the naked eye from the beach below. At a quarter past 10 she cast anchor in the roads, and proved to be the Elau steamer, which had formed part of the escort of honour of the King. A boat shortly afterwards put out from her, and having conveyed an officer on board the packet La Poste, the latter weighed anchor, and after tacking about for some time, until there was sufficient water in the harbour to enable her to float, she made with full steam for Tréport. Shortly after the signal-fort on the cliff had given notice of the approach of the Elau, the Queen ordered her carriage and drove out to Tréport, where she arrived at half-past 10. She alighted at the head of the quay, and walked with her suite before the line, saluted with cries of "Vive la Reine" and "Vive le Roi" from the troops. When the vessel had reached the mouth of the harbour, the Queen rose and repaired to the spot where she was to take up her moorings. The captain of the Elau, who was on board, having perceived Her Majesty, bowed respectfully, and exhibited a letter which he held in his hand. The vessel being as yet unable to approach the quay, he stepped into a boat and lost no time in presenting the letter to the Queen, who communicated its contents to the bystanders. The King informed Her Majesty that the state of the weather would prevent his embarkation at Portsmouth; that he was to proceed to Dover, and cross over from thence either to Calais or Boulogne; that ere she received his letter he would have reached the French shore, and that he expected to join her at the Château d'Eu about 3 in the afternoon. Her Majesty then conversed for some time with the captain of the Elau, and drove back to the Château. No sooner, however, had she returned than she resolved to go out and meet the King on the Abbeville-road, and ordered post-horses. At half-past 12, Her Majesty, Princess Adelaide, M. Martin du Nord, the Minister of Justice, and Lieut.-General Friant left the Château in a travelling carriage, and a few minutes afterwards another carriage, occupied by the officers on duty, followed in the same direction. The party travelled to Abbeville without receiving any intelligence from the King, but just as they were quitting that town, an *estafette* rode up with a letter from the postmaster of Calais, ordering horses for the King and four carriages of his suite. At Nouvion another *estafette* had reached with a similar order, and on arriving at Bernai the Queen was informed that the King would dine at the Hôtel de la Poste. The Queen consequently determined to await there the arrival of His Majesty. Apartments were immediately provided for Her Majesty and suite, and a second table and dinner were prepared for the persons who had accompanied her. The King arrived at Bernai at a quarter past 10, looking remarkably well and apparently very little fatigued by the journey, and after remaining there all night, the King and Queen proceeded to Eu, and arrived at the Château on Wednesday morning. The King intends to sojourn at the Château d'Eu during another week, having, previous to his departure, promised the National Guard of the town to review them on Monday next.

THE FRENCH SQUADRON.—As stated in our last, the Mayor and Corporation of Portsmouth gave a splendid entertainment to the officers of the French squadron on Saturday evening, at which 250 persons were present. The number of French officers was increased in the course of the morning by the arrival of the Inflexible French line-of-battle ship and the Belle Poule frigate at Spithead, whose officers were present at the banquet. Every arrangement had been made to give *éclat* to the event: the dinner was supplied by Mr. Gunter, of Berkeley-square, and the well-known Mr. Toole was engaged as toastmaster. The chair was taken by Mr. Casher, the Mayor of Portsmouth, and in the course of the evening numerous toasts were given by the French and English officers, who cordially concurred in the expression of mutual goodwill, and in the hope that the friendly feeling now existing between the two countries would continue undisturbed. The French officers addressed the company very briefly and in the French language. The Recorder in his speech referred to an important omission in the report of His Majesty's reply, which appeared in the public journals. There was one sentence, he said, which had not been reported, and which was deserving of being treasured up and recorded in the hearts of every French and British citizen. The King said, in speaking of the necessity of peace between two powerful nations like France and England—"I look upon the cordial union of these two nations as the key-stone of the arch which supports the peace of the world." This statement was received by the meeting with loud and continued cheering. On Sunday the French officers were entertained at dinner by Col. Trevor and the officers of the 59th. The events of Monday are fully detailed in the account of the King's movements, and the Queen's visit to the Gomer will be found in the following report of Her Majesty's marine excursion. Admiral la Susse on Monday evening was present at a party at Lady Chamberlain's, and on leaving at 12 P.M., the gallant Admiral called on Sir Henry Pottinger at the George Hotel, being anxious to pay his respects to him before his departure from Great Britain. The interview between the gallant officers lasted for nearly half an hour, and at its conclusion the French Admiral departed from the George in a coach, accompanied by Lieut. Chamberlain, Commander of Her Majesty's steamer, Dwarf, and the English pilot, the latter of whom was pressed to take a seat inside the coach by the gallant Admiral, to which the bluff old sailor somewhat reluctantly acceded. In a

few minutes more the Admiral had taken farewell of Portsmouth, and, seated in his barge, proceeded towards the Gomer, at Spithead, as fast as sixteen oars could speed him on his way. On Wednesday morning the weather was very fine, and the sea comparatively smooth. The French steam squadron, with the Reine Amelie brig yacht, and La Favori cutter, left their anchorage at a quarter past 6 o'clock for their own harbours. The Inflexible and Belle Poule, set up top-gallant masts and top-gallant yards, and hoisted the blue peter for the recall of all officers and seamen from the shore, as early as half-past 6. The Belle Poule got under weigh at half-past 8, and the Inflexible at half-past 9 o'clock. They were soon out of sight, and Spithead is now solely occupied by British men-of-war.

The Queen's Visit to the Isle of Wight.—Shortly after the departure of the King of the French on Monday evening, her Majesty and Prince Albert went on board the royal yacht from the Clarence yard. At the moment the Queen reached the deck, every portion of the royal yacht suddenly shot forth, as if by magic, into one dazzling blaze of blue stars. The entire front of the Clarence yard presented at the same time a similar novel and splendid sight. Her Majesty's tradesmen resident in Portsmouth had their houses brilliantly illuminated. Numerous private dinner parties were given in celebration of the Queen's visit, and a subscription ball, on an unusually splendid scale, was given at the King's Room, South Sea Beach. Amongst the private festivities was the dinner given by General Sir Hercules Pakenham, who included among his guests Sir Henry Pottinger, who arrived at Portsmouth on Sunday afternoon, accompanied by Colonel Malcolm, from China. The Queen and Prince Albert slept on board the yacht in Portsmouth harbour on Monday night. About daybreak on Tuesday the storm had somewhat abated, and hopes were entertained by the boatmen that it would clear up sufficiently to encourage pleasure parties to venture out in order to witness Her Majesty's departure. In this, however, they were disappointed, for on the Gosport side there were hardly a dozen persons on the beach, the majority of whom knew nothing of the King of the French's inland journey, and could hardly believe that it was not a hoax. About 7, A.M., a number of signal flags were hoisted on the royal yacht, evidently communicating with the fleet at Spithead. Immediately afterwards the steamer Comet left her moorings, and took up a position a-head of the royal yacht, and in an instant all the vessels in the harbour, which a moment before showed nothing but bare ropes and poles, were profusely decorated with flags. At 8 o'clock the royal yacht cast off her moorings, and as she got under weigh the Victory manned her yards and saluted. Previously to this the Admiralty barge, with the Lords of the Admiralty, went on board to pay their respects to Her Majesty, and accompanied the yacht to Spithead. The French war steamer Caiman left the harbour shortly before the royal yacht, and Le Favori brig was towed out by the Echo steamer immediately after. Several yachts belonging to the Royal Yacht Squadron got under weigh at the same time, and accompanied Her Majesty on her progress. As soon as the yacht left the harbour, the French and English men-of-war at Spithead and St. Helen's commenced saluting, L'Inflexible and La Belle Poule saluting with broadsides instead of single guns. As Her Majesty passed the pier and ramparts on her progress to Spithead, the persons assembled on them loudly cheered Her Majesty, who was standing on the quarter-deck. When the yacht neared the Gomer the engines were stopped, and although the wind had freshened since her departure from the harbour, Her Majesty and Prince Albert went on board the Gomer, accompanied by Lady Gainsborough, Lord Liverpool, and the Lords of the Admiralty. Her Majesty was received by Vice-Admiral Baron La Susse, Capt. Goubin, and other officers of the ship who were assembled on the quarter-deck. The royal standard was hoisted on board the Gomer, and saluted by broadsides from the French ships. When Her Majesty first stepped on the quarter-deck of the Gomer, she appeared a little surprised at the immense size of this magnificent steamer. She was conducted over the vessel by Admiral La Susse, and examined every part minutely. Its powerful armament, guns of heavy calibre, and decks crowded with soldiers, formed a great contrast to her own yacht, where nothing of the sort is to be seen, the Victoria and Albert not having a gun of any description, not even a swivel on board, or a single marine among her crew. The Gomer on the other hand, is a powerful war steamer of the first class, and was only fitted up as a temporary yacht for the conveyance of His Majesty to England. The state cabins, which were specially prepared for His Majesty's use, are furnished in a style of magnificent splendour, which forms another contrast to the more unpretending, but not less elegant manner in which Her Majesty's cabins are fitted up. Her Majesty, who never before had been on board a war steamer of such magnitude, expressed to Admiral La Susse her astonishment at the great capabilities of the vessel, and her admiration of the excellent state of order and cleanliness which prevailed on board. After Her Majesty had been conducted over the ship she was invited by the Admiral to partake of an elegant *déjeûner*, and altogether remained on board nearly an hour. Her Majesty in taking leave returned her acknowledgments to the gallant Admiral for the courtesy he had displayed, and bowed to the officers. When the Queen left the Gomer, the French men-of-war again thundered forth their broadside salutes, and as soon as the standard was re-hoisted on board the Victoria and Albert, the English ships commenced their salutes. The yacht then proceeded on her course to the Cowes Roads, and passed close to La Belle Poule, between her and L'Inflexible, both of which had their yards manned. As the yacht neared these ships, the men on the yards cheered as she passed. Her Majesty, who was on deck with Prince Albert at the time, acknowledged the compliment by bowing, and his Royal Highness took off his hat. Spithead at this time presented a very gay appearance, the whole of the French and English ships and steamers of war being dressed out with flags. The yachts which left Portsmouth shortly after Her Majesty were pursuing their course towards the Solent during part of the time Her Majesty was on board the Gomer, in the expectation of reaching Cowes ere the royal yacht should arrive with the Queen. In this, however, they were disappointed, for when about midway between Ryde and Cowes, the royal yacht came up with them, and passed by them one by one, the Kestrel and the Xarifa being the two last she overtook, which she did close to Cowes, the Xarifa saluting as she passed. As the royal yacht entered the roadstead, salutes were fired from the batteries and from the Royal Yacht Squadron Club-house, and the yachts then at the station. No man-of-war steamer accompanied the royal yacht to Cowes; the only steamer that followed her was the Comet, which came to take the Lords of the Admiralty back to Portsmouth, and which returned with them as soon as Her Majesty had landed. The Queen immediately proceeded to Osborne House, distant nearly two miles from the landing-place, and was loudly cheered by the people assembled on the line of route. The equerries in attendance returned to town before the Queen left Portsmouth, and the retinue of servants was exceedingly small, Her Majesty being desirous of remaining during her brief sojourn in perfect privacy and seclusion. —On Wednesday, Prince Albert rode round Barton's Farm, accompanied by Sir James Clark, preparatory to a day's shooting on the estate. In the afternoon Her Majesty took a walk on the beach, and afterwards made an excursion in the barge of the royal yacht, which was steered by Lord A. Fitzclarence. Her Majesty rowed about the waters of the Solent for upwards of two hours, and did not return until after sunset. On Thursday morning Her Majesty was stirring by daybreak, and shortly afterwards was seen, with the Prince, crossing the lawn of Osborne-house towards the sea-beach, where they continued to promenade for a considerable time. Her Majesty afterwards went round the grounds, and frequently expressed the liveliest satisfaction at the beauty of the scenery. In the afternoon, Her Majesty and the Prince, with several members of the royal suite, embarked on board the royal yacht for the purpose of enjoying a short excursion. The yacht passed Ryde, when the inhabitants stationed on the pier welcomed Her Majesty with repeated cheers, and then steamed past Spithead under salutes from the men-of-war at anchor. She then proceeded to the Nab Light, and there bore up for Cowes. The men-of-war were dressed in their colours as the yacht passed them on her return, and the platform battery at Portsmouth saluted. Yesterday it was Her Majesty's intention to take another trip on the other side of the island. Her Majesty will return to Windsor Castle this day, it is expected, to luncheon, as arrangements have been made for the Court to leave Osborn-house at 9 o'clock. It is expected that Her Majesty and Prince Albert, accompanied by a portion of the Infant Royal Family, will again pay a visit to the Isle of Wight for a week or ten days, after the opening of the Royal Exchange on Monday week.

The Peerage.—Tuesday's *Gazette* contains the following notice, dated Whitehall, October 11:—The Queen has been pleased to direct letters patent to be passed under the Great Seal, granting the dignities of Viscount and Earl of the United Kingdom of Great Britain and Ireland unto the Right Hon. Edward Lord Ellenborough, and the heirs male of his body lawfully begotten by the names, styles, and titles of Viscount Southam, of Southam, in the county of Gloucester, and Earl of Ellenborough, in the county of Cumberland.

The Church.—Three valuable benefices are at present vacant in London, viz., the rectory of St. George's, Hanover-square, in the gift of the Bishop of London; the rectory of St. Luke's, Old-street-road, in the gift of the Dean and Chapter of St. Paul's; and the vicarage of St. Stephen's, Coleman-street, the election to which is vested in the parishioners. The Rectory of St. George's Hanover Square, vacant by the death of Dr. Hodgson, is worth 1550*l.* a year, and the Deanery of Carlisle, also vacant by Dr. Hodgson's death, is worth 1600*l.* a year.

Foreign.

France.—The Paris Journals of the week have been again occupied with the King's visit to England; but they have ceased to possess their former interest. The Ministerial Papers have contained long letters from their own correspondents, describing in enthusiastic language the reception given to Louis-Philippe. The accounts which have appeared in the Opposition prints have been almost wholly extracted from the reports of the London Press, but are seldom noticed with the courtesy and friendliness in which they are written. The majority of these papers contend that the hearty welcome given to the King in this country was intended for him personally, and should not be held in the most remote degree to prove that the "cordial understanding" between the two nations was real. The republican *National* in particular has perverted every detail of His Majesty's visit, even to the pieces of music performed at the state dinners at Windsor Castle, into fresh affronts studiously offered to France, and still represents his Majesty's visit as most injurious to the honour and interests of the nation. It was rumoured in Paris that the visit had been turned to political account: that M. Guizot had used the opportunity to obtain from our Government a "mitigation of the terms of the treaties of 1831 and 1833, touching the right of search," and that Sir R. Peel had obtained the promise of a revision of the French tariff in our favour, and the abandonment of Tahiti.—It was announced in Paris, on Monday, that His Majesty the King of the French, in honour of his visit to England, had granted a complete amnesty to all offenders who have taken refuge in, and are now residing in Great Britain.—The *Constitutionnel* of Friday publishes a report addressed by Capt. Bruat, the Governor of the French possessions in the Pacific, to the Minister of Marine, in which he gives an account of the battle fought at Mehaena, between the French and the natives of Tahiti on 17th April. This report sets at rest the statement so often put forth by the French journals that Englishmen were the leaders of the Tahitians, and that the missionaries had encouraged the natives to resist the French. From the official report of Capt. Bruat it appears that the missionaries endeavoured to the last, though without success, to prevent bloodshed, and that the French were the aggressors. The publication by Capt. Bruat of his despatch is likely to get him into some difficulty. It first appeared in the *Océanie Française*, a French paper published in Tahiti, under the auspices of Capt. Bruat himself; and the publication by an officer of an official document addressed by him to his Government, without the sanction of the home authorities, is a breach of discipline, for which he is severely censured by the Ministerial Papers, and there is little doubt that the Government will remove him from his command. Capt. Bruat's journal states, that after his victory he made a fresh attempt to effect a reconciliation with the Chiefs, and had, with that object, appointed to meet them on the 30th April or the 1st May. He had also sent an invitation to Queen Pomaré to "come ashore, pacify her subjects by her presence, and confide in the generosity of the French." Several of the Chiefs waited upon her with a prayer to the same effect, and their interview is thus comically described in the *Océanie Française*:—"She wept, groaned, and exclaimed, 'I am afraid of the Governor.' 'It was he who sent us,' replied the Chiefs; 'we could not think of deceiving you, Pomaré. Come and be happy as a woman and a queen.' Pomaré hesitated, and then confessed that she was not free, and that the English commander of the Basilisk detained her by force."—The *Univers* states, that a plan for fortifying the city of Rouen is being at present prepared at the War-office. The Government have determined that Rouen and Havre, as the two gates of Paris, shall be fortified. A bill for that purpose is to be presented to the Chamber of Deputies in the ensuing session. Letters from Eu state, that since last year Tréport has been rendered exceedingly strong, and that a similar precautionary or defensive system is in contemplation in all the seaports of France.—The *Débats* has advices from Morocco to the end of September, when the inhabitants of Mogadore had re-entered that town, after expelling the Kabyles, who had taken possession of it. At Rabat, Larache, and Tangiers, trade, which had been for some time interrupted, was recovering its activity.—The long-pending quarrel between Baron Seguier, First President of the Court Royal of Paris, and the Paris lawyers, is about to be adjusted. The Court is to resume its sittings in a few days, when Baron Seguier will express, in a brief address, his affection for the bar, and the *batonnier* of the advocates will reply in an equally conciliatory tone.

Spain.—By a telegraphic despatch we have accounts from Madrid of the 11th, in which it is stated that the Cortes were opened on the previous day by the Queen in person. The speech was drawn up by M. Martinez de la Rosa, who found it difficult to keep it within such reasonable length as not to over-fatigue Her Majesty. Madrid was tranquil, and although immense preparations had been made to counteract an outbreak which was said to be organised, there appear to have been no grounds for apprehension.—Gen. Espartero has issued an address or manifesto to the Spanish nation, which has caused a sensation in Madrid, and is generally considered an able and temperate document. This manifesto was published in London and Paris on the 10th, the day on which Espartero was to have resigned to the Queen his office of Regent. It recounts the details of those events which led to his expulsion from Spain, and appeals to history to record whether, in the midst of the vehement contests of parties, he ever followed any other device but that of saving liberty, the throne, and the laws, from the violence of contending passions. He states that, if he ever is able to return to Spain, he will do so as one of the people, but ever ready to offer his life in defence of the liberties of his country. — Some excitement has been occasioned at Madrid by the accounts of a Spanish war-schooner having been sunk by the guns of the British garrison at Gibraltar. She was chasing a coasting vessel and did not show her colours. A gun was fired to remind her of this duty, but she disregarded the signal, and another gun of much greater calibre was then brought to bear on her from the battery, when so correct was its direction that the shot told with fatal effect, and she sunk shortly afterwards, whilst vainly endeavouring to make for Algesiras. A Portuguese vessel was not far distant, and with its timely aid, as well as some of the boats of the vessels in the bay, the crew were saved.—Mr. Bulwer, our Minister at Madrid, has been honoured with a serenade by the Liberals of Seville, and in acknowledgment has published a letter in the papers expressing cordial sympathy in the

welfare of Spain, but declining to identify himself with any party.—Monsignor Capaccini, the Papal Nuncio, has returned to Rome by way of London, after completing successfully his difficult mission for the settlement of the Church in Spain. Monsignor Capaccini is a distinguished astronomer, and was formerly director of the Observatory at Naples. His visit to London is said to be chiefly for the purpose of selecting some mathematical instruments and chronometers, being still unwilling to relinquish his scientific pursuits amidst the arduous duties of diplomacy.

Germany.—A letter from Berlin of the 2d states that the King of Prussia does not intend quitting that capital this winter, and that his journey to Denmark is therefore postponed. It also states that Lord Palmerston had dined with the King, and had received the visit of all the Ministers, and the diplomatic corps.—A treaty of commerce has been entered into between Hanover and Denmark, which is to be immediately ratified. It gives mutual advantages to the shipping of both countries.—The *Mannheim Journal* of the 6th states, that not only will the treaty of commerce between Belgium and the Zollverein be ratified in a few days, but that it will be still further extended, and that negotiations have been already commenced for that purpose.—The Rhenish papers state that it has been ascertained from undoubted authority that the Grand Duke of Oldenburgh is about to give a constitution to his dominions. They also contain a letter from Vienna of the 30th ult., which states that the offer made by Baron de Rothschild to give 40,000 florins (120,000f.) for the establishment of a Polytechnic School at Brunn, the capital of Moravia, has been rejected by the States of that country by 22 votes to 16. It is said that this rejection has caused a considerable sensation.—The *Augsburgh Gazette* of the 8th announces that the Emperor of Austria will proceed to Presburgh to close the Diet on the 26th in person.

Italy.—A letter from Rome of the 20th ult. states, that several new Cardinals were shortly to be appointed by the Pope, and that the Archbishop of Cologne, who had been received with the greatest distinction by His Holiness, would be among the number. There are now, throughout the world, 147 Catholic archbishops, 584 bishops, 71 vicars apostolical, 9 prefects, 3 apostolicals, and 3267 missionaries. In the course of the present century (from 1800 to 1842), 40 new episcopal sees have been created.—The *Augsburg Gazette* publishes a letter from Naples of the 27th ult., which states that the disturbances in Calabria no longer excite any apprehension in the minds of the Government, of which the King has given proof by sending a telegraphic despatch to order the liberation of the political prisoners in custody throughout the kingdom of Naples.—We learn from Parma that the theatre of the ancient city has just been discovered at a considerable depth in the earth, and in a remarkable state of preservation. The Government has ordered researches to be made, and has purchased several houses which stand in the way of the operation.

Russia.—Letters from St. Petersburgh of the 27th ult. announce the death of Count de Benkendorff, first Aide-de-camp of the Emperor, and former Minister of Police, on board the war-steamer Hercules, on his way back from Germany.—The Russian journals state that on the 27th June, in the district of Osselinsky and the government of Georgia, a mountain, being nearly three wersts in extent from the base to the summit, and covered with trees, slipped, and did not cease to move until it reached the hamlet of Scheleour, covering a space of 24 acres of cultivated land. The hamlet, composed of five houses and three mills, was driven, together with its inhabitants, half a werst further, but no lives were lost.—The committee sitting at St. Petersburgh to dispose of the funds allotted by Prince Frederick of Hesse, being the dowry the Prince received with the late Grand Duchess Alexandrina, has, by permission of the Emperor, resolved to erect an hospital for persons afflicted with affections of the chest, the malady of which Her Imperial Highness died. A fine open space has been selected for that purpose, and the first stone is to be laid early next spring.

Sweden.—A letter from Stockholm states that the coronation of their Majesties was celebrated on the 20th ult. in the cathedral of that city. The morning having been rainy, the procession could not proceed to the church in the order prescribed. Their Majesties, not wishing to delay the ceremony, went there in their carriages, and were greeted with loud expressions of joy. After divine service the coronation took place. When it was concluded, the Prince Royal and his brothers, the Dukes of Upland and Ostrogothie, took the oaths of fidelity to the King, who embraced them both. The act of homage of the States-General also offered an imposing spectacle, and after they had taken the oath the vault of the church rung with cries of 'Long live King Oscar!' The weather having cleared up, their Majesties returned to the Palace on foot, in the order prescribed by the ceremonial. An immense crowd was assembled along their passage, and the windows, roofs, and stands erected for the occasion were filled with spectators, who threw flowers in the line of the procession, and greeted the King with shouts of approbation. The Queen Dowager could not, on account of her mourning, be present at the august ceremony, but on the return of their Majesties to the Palace, they proceeded to her apartment to pay her their respects. The diplomatic corps and the foreigners of distinction, on leaving the church, proceeded to the inner court of the Palace to present their homage to their Majesties as they passed. The King the same day gave a grand dinner of 600 covers. In the evening the city was illuminated, and their Majesties, accompanied by the youthful branches of the royal family, went through the streets in an open carriage, amidst loud acclamations.

Turkey and Egypt.—Letters from Constantinople of the 27th ult. state that fresh disorders have broken out in Albania. It had been hoped, from the successful termination of the campaign of last spring, and the subsequent measures adopted by the Porte for repairing the effects of the revolt, that something like a permanent tranquillity would have been established in that province. The Seraskier had even succeeded in enforcing the conscription in several districts, having raised three battalions of infantry in Calkan-delen, Prestineah, and Uscup. Letters, however, received at Constantinople show that all that had been done during the past eight months for the pacification of Albania has proved without effect, and that a fresh revolt has begun in that province, equal in extent and gravity to that of last spring.—A fire broke out at Constantinople in the night of the 19th, about 11 o'clock, in the quarter of the horse market. It spread with great rapidity, the wind blowing fresh from the north-west at the time, and in a short period it had communicated to a great extent of building. At the first alarm, the Ministers, the Pachas, the Grand Seraskier, and the authorities, hastened to the spot; but though every exertion was made, it was not until five in the morning that the flames could be got under. Not less than 300 shops and stables were destroyed, and about 150 houses, some of which were fine ones. The high functionaries did not withdraw until they had taken measures to afford assistance to such persons as the conflagration left destitute. It has been ascertained that the fire commenced in a kitchen-chimney.—Accounts from Alexandria of 26th ult. state, that Mehemet Ali had not yet returned any answer to the proposal of Mr. Bourne to grant a privilege for the transit of passengers and merchandise through Egypt. It was said that the Pacha has regarded as a mark of disrespect the sending a simple *employé* of the Post-office to negotiate the matter, instead of an officer holding a commission from Her Majesty's Government.—It is said that at the time of the Pacha's flight, and the probability of Ibrahim's taking the reins of government, a powerful faction had formed itself in favour of Abbas Pacha; so that Ibrahim stands little chance at the death of Mehemet Ali. Said Pacha only looks to the Porte to back him in case of any serious disturbance breaking out. The fellahs have no affection for either of them, siding with none, and it is said that the troops would disperse of themselves.

South Australia.—In a file of papers from Adelaide, South Australia, lately received, the result of a Government census of that colony is given, exhibiting a total of 17,196 souls as the population in February, 1844, exclusive of the aborigines, estimated in round numbers at 650 more:—The numbers of each age under two years are, 1724; two and under seven, 2893; seven and under fourteen, 2563; fourteen and under twenty-one, 1788; twenty-one and under forty-five, 7428; forty-five and under sixty, 738; sixty and upwards, 62; total, 17,196. In these numbers are not comprised 70 persons reckoned for Kangaroo Island, and 100 for the distant locality of Mount Gambier, which, if added, will make the grand total of colonists 17,366. The census taken by Mr. M'Laren of the survey, in February, 1841, with less assistance, but which has always been considered sufficiently accurate for general data, makes the population at that period little short of 15,000. With the increase of population it is satisfactory to observe there has been a decrease of crime, the number of convictions in 1840 being 47; in 1841 only 37; in 1842, 36; and in 1843, only 31. In 1840 there were 70 public houses in Adelaide; in 1841, 67; in 1842, 44; and in 1843, only 34. The religious distinctions stated among the results presented by the diligent inquirers under the Census Act are too interesting to omit. They are as follow:—Church of England, 9418; Church of Scotland, 1691; Wesleyan Methodists, 1669; other Protestant Dissenters, 3309; Roman Catholics, 1055; Jews, 25; Mahommedans and Pagans, 32. There are 16 flour mills in South Australia, and 29 manufactories. The number of acres under cultivation in 1843 was 28,690. The value of exports of colonial produce, which in 1840 amounted to 15,650*l.*, in 1843 reached 66,160*l.* 17*s.* 2*d.* The amount of Government expenditure in 1840 was 169,966*l.* 19*s.* 5*d.*, and the revenue 30,199*l.* 14*s.* 11*d.*; in 1841, the expenditure was reduced to 104,471*l.* 12*s.* 3*d.*; and the revenue amounted to 26,720*l.* 15*s.* 11*d.*; in 1842, the expenditure was further reduced to 54,444*l.* 7*s.* 3*d.*, with a revenue of 22,074*l.* 4*s.* 6*d.*; and in 1843, the expenditure was 29,842*l.* 16*s.* 6*d.* only, and the receipts 24,142*l.* 15*s.* 2*d.*; whilst the first quarter of the present year shows an excess of receipts above expenditure, the total receipts for the quarter ending March 31, being 7928*l.* 15*s.* 8*d.*, and the total expenditure 6887*l.* 8*s.* 7*d.*

United States.—By the Britannia steamer we have advices from New York to the 30th ult. Mr. Calhoun, Secretary of State, has been busily engaged in investigating all the questions at issue between England and the United States, and it is anticipated that he will be prepared with new measures on the subject in the coming Congress. The only statement from a high source is the remark, that "the difficulties between England and the United States are so arranged that the claims of the United States are placed on a satisfactory and honourable basis." The next session of Congress will be important.—The Canadian Parliament has been dissolved, and a new election ordered, the new Parliament to meet on the 12th November. Letters from Canada say that the two chief parties are monarchical and republican, one strenuous for British connection, the other anxious for independence, or annexation to the United States. The election it is expected will be the most important and exciting ever held in the province.—We learn, *viâ* Havannah, that Gen. Woll has actually commenced operations against Texas on the Rio Bravo, and that Gen. Houston, President of Texas, had sent overtures to Santa Anna for peace, the character of which has not transpired. General Houston and his troops, however, have captured the ringleaders of the "Regulator" and "Moderator," bands of brigands that infest Northern Texas. Matamoros, in Mexico, has been nearly destroyed by a hurricane, and several people killed. The town of Basseterre, Guadaloupe, has been destroyed by fire. Mr. Wolf, agent of the American Mining Company in Cuba, and several English and American miners have been arrested, charged with a participation in the recent slave insurrection. The governor of Cuba has offered premiums for the settlement of white families in that island. There has been a new revolution at Lima, in which Domingo Elias, a private citizen, has been proclaimed president. Guano from the coast of Labrador is abundantly imported into the British provinces. Trinidad was visited by an earthquake on the 30th of August, but no material damage was sustained. Mr. Macready took his farewell of the American stage at New York, in the character of *King Lear*. The Park Theatre was densely crowded on the occasion. It is said that Mr. Macready has realised a profit of 35,000 dollars by his visit, a part of which he has invested in Ohio 6 per Cents.

CITY.

Money Market. Friday.—Consols closed at 100⅜ for money, and 100½ to ⅝ for account; Bank Stock, 105 to 6; Red. Three per Cents., 99⅝ to ⅝; Three and a quarter per Cent. New, 102 ⅜ to ½; India Stock, 287 to 8; Exchequer Bills, 73 to 75 pm.

GAZETTE OF THE WEEK—BANKRUPTS.—W. Misper, Colchester, Essex, builder—T. B. Hall, Coggershall, Essex, grocer—M. and B. Lee, Duke-street, Piccadilly, tailors—F. A. Berkner, 20, Homer-street, Crawford-street, Marylebone, clothier—H. D. Williams, Southampton, plumber—G. Ball, Bath, carpenter—W. J. J. Coall, Exeter, grocer—T. Tarbrenner, Birmingham, corn factor—J. Bibby, Liverpool, coach proprietor—B. Perkins and S. Woolley, Stamford, drapers—T. Smith, sen., Minto-street, Bermondsey, wool stapler—W. Chequer, Blackfriars-road, saddler—C. Rogers, Bishopsgate-street Within, saddler—R. Footner, Lymington, Hampshire, upholsterer—W. Hill, Woolwich, builder—W. Richardson, Newcastle-upon-Tyne, glass manufacturer.

Metropolis and its Vicinity.

Court of Aldermen.—A Court was held on Tuesday for the purpose of swearing in Mr. David Salomons, as Alderman of Portsoken Ward. The town clerk called upon Mr. Salomons to make the usual declaration, the omission to subscribe which was fatal to his election for the ward of Aldgate nine years ago. After an ineffectual attempt to obtain an adjournment for the purpose of consulting high legal authorities on the subject, Mr. Salomons addressed the meeting at great length, stating that as a Jew, he could not conscientiously make the declaration, and contending that it was an unnecessary and illegal form. He had served the office of high sheriff of Kent, to which he had been appointed by Her Majesty; he had also served the office of sheriff of London and Middlesex on the appointment of his fellow-citizens; he was a deputy-lieutenant for the county of Kent, and a magistrate of two other counties. He protested therefore against his exclusion by the Court of Aldermen, and said that although he might enter that Court under the cloak of being a Separatist, he disclaimed any subterfuge, and would only enter the Court conscientiously and as a man of honour. After some discussion and several divisions, the Court resolved by a majority of 10 to 6, that Mr. Salomons' election was void, and the lord mayor was requested to hold a new election. Mr. Moon and Mr. Bousfield have since come forward as candidates, Mr. Salomons having declined another contest, as it is his intention to petition against the decision of the Court of Aldermen.

Court of Common Council.—A Court was held on Thursday, when the Lord Mayor announced that the deputation appointed by the corporation had had the honour of waiting upon the King of the French with the city address, and that His Majesty had been graciously pleased to give an answer, which the Recorder would read to the Court. The answer was accordingly read and each paragraph received with vociferous applause. It was then resolved that the address of the corporation be ornamentally written, properly emblazoned, framed and glazed, and transmitted to His Majesty the King of the French. It was also unanimously agreed that the answer of the King of the French should be inserted upon the records of the Court, and that steps should be taken by the committee to emblazon and otherwise record the answer of the King, and that an engraved copy should be transmitted to every member of the Court. It was also resolved that an address be presented to the Queen on the occasion of her auspicious visit to the city to open the Royal Exchange.

New Royal Exchange.—It is announced on authority that Her Majesty has been graciously pleased to appoint Monday, the 28th inst., for the opening of the New Royal Exchange. Her Majesty will enter the City at Temple Bar at 12 o'clock. As the day approaches the works of the interior of the Exchange have been proceeding with increased activity, so that the apartments may be in as forward a state as possible by that period, and from the progress made within the last fortnight, it is the general opinion that the different rooms will be almost finished, so as to require but slight preparation and temporary decoration on the auspicious occasion. The grand entertainment is to be laid out in Lloyd's room. A cross table for ten is to be placed on a raised flooring at its south end, at which Her Majesty, Prince

Albert, and the principal guests are to be seated. Three extended tables are to be formed from north to south, and the leading visitors, the Lord Mayor, and members of the Royal Exchange and Gresham Committee, the Aldermen and Common-councilmen of the City, and chief officers, are there to be accommodated. It is understood that the Duke and Duchess of Cambridge, the Hereditary Grand Duke and Duchess of Mecklenburgh Strelitz, and Prince Edward of Saxe Weimar, are invited to the entertainment. The Duke of Wellington has engaged to meet the Queen, and Sir R. Peel and several other members of the Government are likewise to attend. The Master of the Horse, Lord Chamberlain, and Lord Steward, are to be among the officers of the household who will attend the Queen in their official capacity. Most of the foreign Ministers are to be invited, with the Lord Chancellor and Judges. It is ascertained that sufficient space can be afforded at those tables for 360 persons. There are to be three military bands, viz., those of the Royal Horse Guards, the Coldstream, and Grenadier Guards. At the several banquet-tables a gorgeous display of plate is likely to be witnessed, for not only that belonging to the Corporation, but that belonging to the Goldsmiths' and other wealthy companies is to be used in the adornment of the tables. In the commercial-room, a capacious apartment, ranging the whole extent, east and west, of the north side of the merchants' area, an entertainment is to be supplied for 400; and in the colonnade in the quadrangle, or merchants' area, 600 persons are to be accommodated. The Lord Mayor and civic functionaries are to be in waiting at Temple Bar at 12 o'clock, so that due homage may be paid to the Queen on Her Majesty's entrance into the city. On the procession reaching the portico of the Exchange, the members of the committee, headed by the chairman, are to await Her Majesty, who, on descending from the royal carriage, will be formally received by those gentlemen. Two o'clock is the hour named for the entertainment. There are to be 600 special constables, in addition to the city police, on duty along the line of procession.

Middlesex Magistrates.—The following gentlemen have been appointed magistrates for the county of Middlesex:—Messrs. W. H. Ashpitel, J. Fisk Pownall, jun., J. Arden, Colonel Wood, J. Mazer, Hon. C. L. Butler, H. Penton, J. Wheelton, C. H. Cotterell, J. A. Moore, Sir Moses Montefiore, J. H. Longdon, W. P. Crawford, and C. Graham. Sergeant Adams, on Thursday, resigned the situation of Chairman of the Bench of Magistrates, in consequence of being appointed Assistant-Judge of that court. It was unanimously agreed to present the learned Sergeant with an address "congratulating him on a selection by the Crown so honourable to him, so beneficial to the country, and so acceptable to the Court;" and assuring him that "the Court will not forget his valuable and disinterested services as their Chairman during the past eight years, his cheerful and social virtues, his benevolent dedication of his time and energies to various measures of great local interest and public importance." The election of a new Chairman will take place on the January county-day.

Royal Mail Steam Packet Company.—The half-yearly meeting of this company was held last week; Mr. Baring, M.P., in the chair. The report stated that the total receipts for the half year amounted to 174,927*l.*, those for the corresponding half year of 1843 being 158,048*l.* There was an increase for provisions and stores, but still there was a considerable excess on the side of receipts. Since the last meeting the debt of the Company had been further reduced 20,000*l*; and the directors intend, in February next, to pay off 50,000*l.*; the remaining balance of their debt. The Admiralty having recently required that the mails to and fro between Jamaica, Santa Martha, Carthagena, Chagres, and St. Juan de Nicaragua, shall be conveyed by steam instead of by a sailing vessel, it would be necessary to build a new steamer; but it was expected that the receipts upon that route may increase, so as partly to defray the additional charge. The report was unanimously approved of, and the chairman stated that the officers who had been guilty of negligence, in reference to the late accident to the Tay, had been dismissed from the Company's service.

Baths and Wash-houses for the Working-Classes.—On Wednesday a meeting was held at the Mansion House, convened by the Lord Mayor, to take into consideration the best means of promoting the establishment of baths and wash-houses for the labouring classes. The body of the hall was completely filled, and the Lord Mayor having taken the chair, opened the business of the meeting by stating that, having received a petition most respectably and numerously signed, he had felt himself called upon to comply with the request, and he had with much pleasure called a meeting in that hall for the very laudable purposes for which they were then met. The Bishop of London moved, and Mr. Byng, M.P. for Middlesex then seconded the 1st resolution, "That great advantage has been found to result to the labouring classes from the establishment of baths and wash-houses for their accommodation, whereby habits of cleanliness have been promoted, and their families have been relieved from the inconvenience of washing their clothes in their own rooms." Archdeacon Wilberforce moved, and Lord D. Stuart seconded, the second resolution:—"That it is highly desirable to extend the advantages of such establishments to the labouring classes of the metropolis, especially in those crowded and populous districts where the want of such accommodation is severely felt." Archdeacon Hale moved, and Sir G. Larpent seconded, a resolution appointing a committee; and the meeting having adopted all these resolutions unanimously, was addressed by Mr. Colquhoun, M.P., Mr. D. Salomons, Alderman Johnson, Rev. Dr. Russell, and Mr. Cotton, Governor of the Bank of England. To the latter gentleman the public are indebted for setting on foot a measure which is so well calculated to promote the comforts of the poor.

Wood-Paving.—On Saturday the Marylebone vestry confirmed by a large majority the resolution of the previous meeting, which declared they would not entertain the question of wood-paving for a period of three years from that date. It was also resolved that the Metropolitan Wood-Paving Company should be served with an official notice that the vestry, in accordance with their contract, required them to put the 4000 yards of wood-paving, between Wells-street and Rathbone-place, in a state of efficient repair, to the satisfaction of the parish surveyor, forthwith. It was stated that this piece of paving had, at the outset, cost the vestry 2000 guineas, and although it had not been down four years it had cost the vestry 210*l.* per year to keep it in repair, in all 2710*l.*, which was at the rate of 3*s.* 6*d.* the superficial yard per annum. If the same space of Oxford-street had been paved with granite it would, it was said, have cost 600 per cent. less than this wood-paving, and even the macadamized road had only cost 1*s.* 11*d.* per yard.

The Distressed Needlewomen.—On Friday a deputation from the Distressed Needlewomen's Society, accompanied by Alderman Farebrother, the president of the society, had a long interview with the Poor Law Commissioners on the subject of the low prices at which needlework was taken at the different unions, when the commissioners expressed their anxious wish to afford all proper assistance to meet the wishes of the deputation.

Westminster-bridge.—On Monday, the carriage-way of Westminster-bridge was closed for further repairs. By a recent Parliamentary return it appears that from the year 1810 to April 1838, the sum of 83,097*l.* 6*s.* 9½*d.* was expended in the repairs and alterations of the bridge, together with charges for professional and other services. The cost since 1838, in the repairs and alterations, amounted to 82,661*l.*, and a further sum was required of 52,879*l.*; and if the footpaths were made the same as London-bridge, an additional sum of 40,000*l.* would be expended. The total income of the property belonging to the commissioners of the bridge is 7464*l.* 11*s.* 8*d.* a year. It will be perceived that the sum expended since 1838, and the further sum required, amount in six years to upwards of 135,000*l.*, whilst the income derived from the property of the bridge in the period only amounts to 44,787*l.* 10*s.*

The Statue of William IV.—The beautiful pedestal which is intended for the Statue of William IV., was on Monday raised to its full elevation (25 feet), and in a few days the statue will be placed on it. The site of the statue is most commanding, and will, when completed, not only form an excellent point of refuge at those immense thoroughfares, King William-street Arthur-street, and Gracechurch-street, but will also form an interesting ornament, particularly when seen from London Bridge. It will be erected under the direction of Mr. Chadwick, by whom also the sculptural decorations of the pedestal have been executed. The column or pedestal is the frustrum of a cone, formed of large circular blocks of Hayter granite; encircled at the lower part of the base is a massive design of a chain cable. In the centre of the pillar is a Grecian scroll, and immediately beneath the capital is a circular wreath of oak-leaves, with acorns.

The Science of Warfare.—A Society under this name has been formed, and has located itself at Mulgrave-house, Fulham, having for its object the "advancement of science, and the establishment of universal peace," by the apparently incongruous means of teaching the art of war. The Society is not yet in operation, and the institution will not be opened to the public generally till the ensuing spring, but in the meantime the directors have commenced a series of experiments in warfare, which were exhibited on Tuesday. The inventor of the new science of warfare is the gentleman who, for many years, has called himself the Duke of Normandy, who proposes by his inventions "to place at the command of our young and beloved Sovereign such a tremendous machinery of warfare as to enable Her Majesty to maintain universal peace." Some of his inventions are similar in effect to those of Captain Warner, but in addition to the explosive power which he has at command, the "Duke" also has invented a cannon on the principle of *non-recoil*, by means of which a certain aim may be taken, and the discharges made with greater rapidity. The shells exploded on Tuesday were very destructive in their effects, and the inventor appeared to have complete control over the explosive agent as applied to different modes of warfare. One of the rockets was fired at a distance of two hundred yards from a bulkhead against which a stout sheet of iron had been firmly nailed. The rocket exploded the instant it struck the object, with such force as to rend away the iron and to shiver the thick planks of wood behind, which had been fastened together in the firmest possible manner. The rocket did not weigh above a pound, and it was directed to the mark by a conducting wire, as the limited space and the passing of boats on the river rendered it dangerous to risk firing at the target. The non-recoil cannon, though fired on a table, on which the least motion would have been observable, did not recoil in the least, and it is so counterpoised that a cannon of the largest calibre, it is stated, may be pointed and fired with one hand nearly as readily as a pistol.

Encroachments on the Regent's-Park.—On Saturday, at a numerous meeting of the vestry of St. Marylebone, for the purpose of considering what steps should be taken with respect to recent inclosures of portions of the Regent's-park, it was agreed, on the motion of the Rev. Dr. Fellowes, that a memorial should be presented to the Commissioners of Woods and Forests, representing "that a part of the Regent's-park, in one of the green slips adjoining the ground attached to Hanover Lodge, has been inclosed with an iron wire-fence, and thus taken from the public use; and that the green slips which lie to the north of the Park, between the canal and the road of the outer circle, are more prized by the public in general for the rural scenery which they exhibit, and for the shady walks which they afford, particularly during the hot summer months. Your memorialists, therefore, setting the highest value on these slips, are greatly grieved to see one of them fenced in, and abstracted from the public benefit."

Hampstead-heath.—The inhabitants of Hampstead, who have been long threatened by Sir T. M. Wilson, the lord of the manor, with having their beautiful heath encircled with "squares, streets, and courts," and to effect which Sir Thomas has petitioned Parliament at intervals ever since 1829, have been in consternation during the past week, upwards of 80 workmen have been employed in levelling the fences between the various fields belonging to Sir Thomas between the Vale of Health and Highgate. On Saturday Sir T. Wilson commenced operations on the heath itself, but the committee of copyholders will, it is supposed, call a meeting of the copyholders as early as possible, intimation having already been given to Sir T. Wilson that the copyholders dispute his right to interfere with the heath, which, in his recent applications to Parliament, he has always professed he had no intention of doing.

Wandsworth and Clapham Union.—On Wednesday a long inquiry took place before the Coroner for East Surrey, concerning the death of Robert Russell, a plasterer. The evidence went to prove that deceased whilst at work in a building recently erected in South Fields, Wandsworth, on Saturday week last, fell from a scaffold six feet in height. He was unable to resume his work, and went home to the public house where he had lodged for the last eighteen months. He at first only complained of his chest and a difficulty of breathing, but afterwards became worse, and Dr. Conuor having been called in, discovered that four of his ribs on the left side were fractured. Although he was then, as admitted by the doctor, in a most alarming state, he was removed by his directions in a carriage to the workhouse infirmary in the course of that afternoon. Until between ten and eleven o'clock at night he was not seen again by a medical man, and then a pupil of Doctor Connor's attended him. Although it was known that he was dying, no nurse sat up with him, and at six o'clock the next morning he was found dead. The master of the workhouse was desirous that an inquest should be held, but he was overruled by the surgeon, who stated there was no necessity. The circumstance, however, came to the Coroner's ears, and he instituted the present inquiry. The Coroner and Jury strongly commented on the conduct of the nurses and surgeon to the union, and the latter, in returning their verdict of "Accidental death," desired that it might be intimated to the board of guardians that common humanity demanded that a night nurse should be appointed in such an extensive institution.

Fire at the New Cross Station.—On Monday night, while the officers of the Dover railway were engaged in making preparations for the reception of the King of the French, a destructive fire broke out in the octagon store-room attached to the station, and raged with such fury that the entire building was in flames before any effort could be made to save it. It passed rapidly to the locomotive factory, with which it communicated by an open passage, and in a short space both buildings were completely burnt down. Before there was time to send information of the outbreak to the engine-station, the ascent of the flames had completely illuminated the whole of the metropolis, thereby causing a complete turnout of all the engines. By the exertions of the firemen and of the troops who arrived as an escort to the King of the French, the Company's chief store-house and offices were saved. The damage, however, is estimated at 20,000*l.*, but the loss will be almost covered by the insurances. Among the property destroyed are 6 engines, 3 tenders, and a valuable collection of lathes, tools, and other machinery. The cause of the fire has been traced to the spontaneous ignition of some vegetable black, which was stowed in the paint room.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Oct. 12: West Districts, 144; Northern, 196; Central, 194; Eastern, 241; Southern, 243: Total, 1018. Weekly average for the last five years, 946.

Provincial News.

Arundel.—At the late meeting of the Arundel and Bramber Association, the chairman, the Duke of Norfolk, proposed to give a premium of 50*l.*, this time next year, to "that farmer who shall have proved to the satisfaction of a committee, that he has employed the greatest number of labourers, according to the size of his farm, during the ensuing winter." His Grace added, "I offer this simply as an experiment for one year, and I trust it may be found to answer the purpose intended, and if it do, I beg to call upon all my friends to join in the speculation. If it should answer, I shall most readily continue the premium."

Bingley.—We noticed a fortnight since the successful proceedings of Mr. Ferrand, M.P., and his friends, in carrying out the allotment system in this town. The

Annual Dinner of the friends of the Allotment System and Cricket Club took place on Saturday, Mr. Ferrand in the chair. Previous to the meeting the Cricket Club had a match, at which Lord J. Manners joined the labourers, and entered fully into the spirit of the game. After dinner the meeting was addressed by his lordship, and by Mr. D'Israeli, Mr. Ferrand, and other gentlemen. Lord J. Manners returned thanks for the agriculturists of England, and said—

"It is a matter of sincere congratulation to find that agriculture still sits enthroned in the hearts and affections of the people—that it is now the theme of every tongue, and is received at every meeting with the same applause with which, coupled with commerce, it has been received here to-night. It is not to be wondered at that at a place like this, which may be called the neutral ground, no antagonism is recognised between them; and that here the farmer, who feeds the clothier, and the manufacturer, who clothes the farmer, should be aware of that most important truth sometimes elsewhere forgotten, that their interests are mutual and inseparable. I may safely, and without fear of failing in my predictions, congratulate the owners of the Bingley allotments on the benefits I believe they will derive from them; and I will go farther, and state my sincere and strong opinion, that the time is not far distant when throughout the whole of England the great truth will be felt, acknowledged, and acted upon, that the peasant who has a stake in the hedge is more likely to be a better man, a better citizen, and a better member of society, than he who merely works for another. I believe, gentlemen, that this allotment system, to celebrate which we are here this evening, will go far to rectify what I cannot help looking upon as a serious and growing evil—I mean the extinction of every agricultural class between that of the rich tenant farmer and that of the day labourer. Many years ago now, that great and good man, Dr. Southey, pointed out in most graphic terms his sense of the danger about to arise from the gradual extinction of all that were called small farms. I am not unaware of the advantages derived from the system of large farms; all that I contend for is, that they should not swallow up all farms of smaller dimensions; and I look to the allotment system, as I trust it will be hereafter developed, as to a certain degree at any rate a corrective of that melancholy state of things - I call it melancholy, because we all know that contentment must spring from hope; and because no one can pretend to say where there are no holdings but large farms, that there the peasant can ever entertain a hope of rising out of that condition in which he has been placed. I do not say that it ever was the custom, or that it ever will become the custom for many of the peasantry of England to rise from their condition and to become farmers; but this I do say, that that system must be wrong which denies the possibility of such a picture being realised; and I again say I look to the allotment system for a correction of that abuse. With the other and more immediate benefits which are derived from allotments I will not detain you. You all know and feel, and practically understand how it has increased the comforts of home, how it has increased sobriety, and how it gives a practical and wholesome education in agriculture to your children; you all know and can appreciate how these obvious good purposes are subserved by it. I will not detain you, therefore, to dilate upon them. But I may say, in another point of view, perhaps less immediate but not less important, that I anticipate great good from the spread of these societies—I allude to the increased production which will be derived from the soil of England. The time, I think, has gone by when the fallacy could be maintained that the plough, as a productive engine, can compete with the spade; and I confess that I know not why we should not anticipate at least a million more of people easily supported from the soil of England and Ireland by the introduction of spade labour and science applied to the cultivation of waste lands than now we can support. I may speak with some confidence on this subject, because it was only a short time ago that I had the pleasure of going over a barren moor, 1500 acres in extent, now being cultivated by the exertions of working men in its neighbourhood; and my father, who has the best interests of the people ever at heart, is this year about to try the practical experiment, whether an acre of land dug will not repay by increased production the increased expenditure in wages. There is another subject which has brought us together to-day—I allude to the celebration of the opening of the Bingley Cricket Club. This is a subject on which I feel with the chairman a great deal may be said, for the time was when kings of England did not think it beneath them to apply their talents and devote their time to regulate and encourage the manly sports and pastimes of their people. No man, however elevated, in those days ever thought of an amusement selfish and apart from the peasants and artisans of his country. I will not mention the names of many of those pastimes—many of them have died out: but I may say that cricket, the game to which you have devoted your attention, is manly, bracing, and brings together in harmonious contact the various classes of society, and therefore I say you do right well to establish conjointly with the allotment system a cricket club. May the two ever flourish and go together, and may their united effects be productive of that good which, in my conscience I believe will be derived from them to the parish of Bingley. The same system which had decreed the peasant should never rise out of the rank he was born in, also denied him any amusement but the alehouse, any rest but on a Sunday; what wonder, then, that the old landmarks were beginning to disappear, and a new and strange antipathy to be seen between the employer and the employed? That estrangement, then, which unfortunately has undoubtedly taken place between the various classes of society, where your good example is followed will give place to cordial sympathy, to the performance of duties and responsibilities on the part of the rich, and to contentment and loyalty on the part of their less fortunate fellow countrymen. You then will have the satisfaction of thinking that the parish of Bingley was not the last to follow this example, but rather among the foremost to see it: and I trust that the anticipations which I have ventured to indulge in to-night will come true, and that I shall be a good prophet when I say, that these institutions, the inauguration of which we celebrate this evening, will be found to work for the good of all assembled here, for the good of your children, and of your children's children; and that you may have the satisfaction of thinking that at no distant period the time will come when we shall be blended altogether in still more cordial and closer bonds of union."

Mr. D'Israeli in his speech thus alluded to the well-known title conferred upon his party:—

"We accept the title of Young England; we believe there is not a hamlet or village, a town or a city, to which that name does not now bring hopeful tidings. We are asked sometimes, what we want? We want, in the first place, to impress on society that there is such a thing as duty. We don't do that in any spirit of conceit or arrogance—we don't pretend that we are better than others—but this we do say, that we are anxious to do our duty; and if we are anxious to do our duty, we think we have a right to call on others, whether they be rich or poor, poor or rich, to do theirs also. Gentlemen, if that principle of duty had not been lost sight of for the last 50 years, you would never have heard of the classes into which England is divided; it had once a unity of purpose and unity of feeling, because every man, feeling the position in which he was placed, did his duty, encouraged by the conviction that, if entitled to rise from the sphere of a workman by talent, the law permitted him to rise. That gate of hope, which my noble friend has so properly and rightly said is the only passage of communication, is open; it is by the allotment system we want to see a bold peasantry, our country's pride. Would any man ten years ago, nay, ten months ago, have talked of England's peasantry being 'a bold peasantry, their country's pride?' Not a man would have had the audacity. Yet that was a phrase in everybody's mouth. We are asked what we want? we have no mystery in telling what we want. We want to put an end to that political and social exclusiveness which we believe to be the bane of the country. Where there is exclusiveness there cannot be sympathy; where there is no sympathy we hold no society can be safe. This is what we want; perhaps we want much more; that is enough at present to communicate to the public. We do not care to talk politics, or to say that we can remedy every evil; we have our opinion on great public subjects, and whenever these are brought out in the senate, we will, with all fairness and moderation, express those opinions, and if they are true they will be adopted. But we are profoundly impressed with this conviction, that it is not so much by law as by manners, that we must look to the influence of manners and not law, to remedy many of the grievances and much of the injury of our people. We believe, then, in the influence of manners; but how are they to influence men if they are divided into classes, and the population of the country becomes a body of sects, and are never brought together? We believe that when the farmer and the manufacturer, the land proprietor and the great mill-owner—when he who employs and he who is employed are brought together; when they communicate their opinions, when they express their feelings, if there is a sympathy of intelligent sentiment, not only would better feeling pervade all classes, but we believe that many will discover that really they are rather differing about phrases than facts. For this reason, there is another thing we desire, which I will venture to express; we have little hope for this country so long as that spirit of faction which has by circumstances been raised, and which has been rampant of late years, is fostered and encouraged."

The Hon. and Rev. P. Savile proposed the health of the occupiers of the allotments, upon which the Chairman called upon one of the allotment tenants to respond to the toast:—

Edward Smith said the allotment system had been one of the best things for the inhabitants of Bingley that ever happened. Before it was commenced, they had to fetch their vegetables a distance of from twenty to thirty miles; and it was very difficult to get them fresh, as the time consumed in their carriage was very long. During the present summer, the occupiers, and not only them, but the whole parish, had the pleasure of having fresh vegetables daily, and as they went through the town carrying the produce of their allotments, people cried out, "Why, you're loaded like bees again." He had been married twenty-six years, and never till last summer had fruit earlier than October; and before the allotment system was commenced, although born and bred in Yorkshire, he had never seen a potato either cut or set. He was an operative, and never had the chance of following any agricultural operations, but now he understood a good deal about them. When trade was good, they were supplied with wholesome vegetables; and if it slackened, as he thought it was doing, they had enough laid by to keep them and their families till spring.

Several other persons addressed the meeting, which passed off to the satisfaction of all present.

Bishop's Stortford.—A young man, called Alfred Yardley, son of Mr. Yardley, pawnbroker, in this town, was committed for trial last week on the charge of having set fire to his father's house on the 5th Sept. last. A short time before the fire, the father had been fined by the magistrates for taking excessive interest, and during his subsequent absence at Gravesend the premises were fired and the pledges burnt. The house was insured for 1400*l.*, which Mr. Yardley had claimed; but the suspicions of the inhabitants were roused, and an inquiry set on foot by the county police, which has led to the above result.

Bolton.—The local papers state that Lord Ashley is making a tour through Lancashire, to inquire into the operation of the Factory Act. On Monday he visited several of the establishments in Bolton, and then proceeded to the other manufacturing towns of the district.

Cambridge University.—The following gentlemen have been appointed the Caput for the ensuing year:—Vice-Chancellor: The Rev. W. Hodgson, D.D., Master of St. Peter's College. The Rev. W. Whewell, D.D., Master of Trinity, Divinity; the Rev. G. Spence, LL.D., Jesus College, Law; J. Haviland, M.D., St. John's, Physic; the Rev. J. W. Blakesley, Trinity, Senior Non-Regent; the Rev. B. Smith, St. Peter's, Non-Regent.

Durham.—Mr. H. G. Surtees has become the purchaser of the estates and manor of Dinsdale, with the Hotel and Spa, from the trustees of the Earl of Durham, for the sum of 40,000*l.* It was from this estate on the banks of the Tees that this ancient family derived their name, *sur*-Tees, in the time of the Norman conquest.

Eton.—The examinations for his Royal Highness Prince Albert's Prize terminated on Thursday, and the names of the scholars who were successful are as follow:—In the aggregate, for French and Italian.—Beamont, 1; Boileau, *ma.*, 2. In French only.—Boileau, *ma.*, 1; Beamont, 2; Stratton, *ma.*, 3; Barton, 4; Peel, 5; Foster, 6. In Italian only.—Beamont, 1; Boileau, *ma.*, 2; Barton, 3; Close and Stratton, equal. The prizes are thus appropriated:—To Beamont, 15*l.* in books, and 25*l.* in money: to Boileau, *ma.*, 10*l.* in books. The examiners were M. de Vericour and Signor Panizzi, who expressed themselves highly gratified.

Farnham.—Lord Ashley, the Dowager Duchess of Beaufort, Lady Charlotte Penrhyn, the Bishop of Salisbury, Dowager Lady Carnegie, Sir Edward Parry, Sir R. C. Glyn, Bart.; the Hon. G. Ryder, M.P., and other persons, have liberally contributed to a fund for the formation of a gipsy school establishment at Farnham, Dorset, with the object of educating that neglected race of people. Lord Ashley has taken very active measures to establish this novel school, where the children are to be instructed in the religion of the Established Church.

Gravesend.—A correspondent of the *Times* has sent to that paper an official return of the number of passengers landed and embarked at the Town and Terrace-piers, Gravesend, from the 1st of June to Sept. 30, 1844, from which it appears the number amounts to—1,275,923 persons; to which must be added about 1000 landed, &c., at the Rum Puncheon Pier; 210,000 ditto at the Rosherville pier; 5000 ditto at Gray's pier; 9000 ditto at Greenhithe pier, 45,000 ditto at Erith pier; 1000 picked up and put out at different places on the river, forming the almost incredible total of 1,546,923 persons, who in the short space of four months have travelled by the Gravesend boats. The favourite packets are known to have carried as many as 1200 and even 1500 persons at one trip, and yet the whole mass have been carried without one single accident occurring to human life.

Liverpool.—On Wednesday week, during the heavy gale which prevailed in the Mersey and Irish Channel, the Iron Duke steamer, from this port to Dublin, ran down a boat containing six persons, all of whom were drowned. There was a good look-out at the time on board the steamer, and the accident is attributed to the darkness of the night. Another boat from the Glasgow, an American ship, was also run down or swamped on the same night, and all hands lost.—On Saturday, a man called M'Gaffey, an inferior officer in the Customs, attempted to murder Mr. Arkle, the landing surveyor at the Prince's Dock, in open day. He met that gentleman near the dock gate, and presenting a loaded pistol to his breast, pulled the trigger; but the cap being too large fell to the ground, and the pistol missed fire. The man was at once apprehended, and on his own confession that he intended to take Mr. Arkle's life, has been committed for trial.—The local papers state that the late James Heyworth, Esq., of Everton, has bequeathed the munificent legacy of 10,000*l.* to his principal clerk, as a testimony of the value which he placed on that gentleman's faithful services for a number of years.—The day for the laying of the first stone of the Birkenhead docks, is said to be definitively fixed for Wednesday, the 23d inst., when Sir Philip Egerton, M.P. for South Cheshire, will officiate.

Manchester.—At a meeting of the inhabitants of Manchester the following resolution has been adopted:—"That it is desirable that a simple and suitable memorial should be placed in the cemetery at Ardwick, over the remains of that illustrious philosopher and exemplary Christian, Dr. Dalton: and that it is desirable to found a professorship of chemistry in some public institution in Manchester, to be named the 'Daltonian Professorship,' one object of which shall be to illustrate the atomic theory, and the discoveries of Dalton, in connection with other branches of physical science."

Newcastle-upon-Tyne.—Another colliery explosion has occurred in this district, by which five persons have been injured, two of whom are not expected to live. The explosion took place at Coxlodge colliery, about two miles from this town, on Monday night, during what is called the "shift." The colliery belongs to Messrs. Bell, Brandling, and Co., and the underground workings are extensive. As fortunately no lives have yet been lost, the circumstances under which it occurred have been ascertained to be accidental, one of the men having allowed his candle to ignite the gas. The same account states that this is the third time this pit has fired within a month, and on each occasion has proved fatal to a few.

Portsmouth.—A distressing accident happened on the King's bastion on Monday, while the troops were saluting in honour of Her Majesty and the King of the French. One of the guns went off while the two artillerymen were ramming home the charge. One of the unfortunate men was literally blown to atoms at the cannon's mouth, and when attempted to be gathered up presented an appearance too horrible to describe. The other was carried to the hospital, but died shortly after. The Jury at the inquest returned a verdict of Accidental Death.—About the same time a French seaman on board His Majesty's brig La Favori had an arm shot off by a similar accident. There being no surgeon on board that vessel, the man was conveyed on board the Victory, where every assistance and relief that humanity and medical skill could suggest was given to him. Amputation of the remaining portion of the shattered limb was resorted to, and hopes are entertained of the poor fellow's recovery.

Sunderland.—The protracted inquest on the bodies of the 95 colliers who lost their lives by the explosion in the Haswell pit terminated on Friday, after the colliery had been examined by Professor Faraday, and Mr. Lyell the geologist, who had been sent down by Government for the purpose. The Jury found that they were accidentally killed, and that no blame is attributable to any one connected with the pit. A subscription has been set on foot for the benefit of the relatives of the sufferers, which already approaches to nearly 2000*l.* The owners of the Haswell Colliery have contributed the sum of 750*l.*

Windsor.—The ponies ridden by Her Majesty, Prince Albert, and the Princess Royal, during their sojourn at Blair Athol, have arrived at the Royal Mews, with the other ponies of Her Majesty, having been presented to the Queen by Lord Glenlyon. Five roe deer have also been brought from Scotland, presents from the same nobleman to his royal visitors.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 3140*l.*; Bristol and Gloucester, 1227*l.*; Eastern Counties, 4629*l.*; Edinburgh and Glasgow, 2536*l.*; Great Western, 17,477*l.*; Grand Junction, 8835*l.*; Glasgow, Paisley, and Ayr, 1546*l.*; Great North of England, 2273*l.*; London and Birmingham, 17,298*l.*; South Western, 7306*l.*; Blackwall, 985*l.*; Greenwich, 826*l.*; Brighton, 6203*l.*; Croydon, 1464*l.*; Liverpool and Manchester, 5190*l.*; Manchester, Leeds, and Hull, associated, 8045*l.*; Midland, 11,988*l.*; Manchester and Birmingham, 3533*l.*; Newcastle and Carlisle, 1969*l.*; Newcastle and Darlington, 1143*l.*; South-Eastern and Dover, 6720*l.*; Sheffield and Manchester, 757*l.*; York and North Midland, with Leeds and Selby, 3183*l.*; Yarmouth

and Norwich, 330*l.* —The inquest on the body of the person killed by the collision at the South Shields station of the Brandling Junction Railway, concluded on Wednesday night. The jury found that deceased had come to his death by the collision, and levied a deodand of 300*l.* on the locomotive which was "the moving cause of his death." They also strongly expressed their opinion that the business of the railway had been conducted in a very negligent manner. It is reported that the Company intend to remove the inquisition into the Court of Queen's Bench, with the view of quashing it on the ground of informality. Two or three other persons injured by this accident are still in a precarious state, and another of the sufferers has expired.—At a meeting held, at Newark on Tuesday, the mayor in the chair it was unanimously resolved that the proposed line of railway from Newark to Sheffield, by way of Southwell, Mansfield, and Chesterfield, to be called "The Newark and Sheffield, or Sherwood Forest Railway," and commencing from a junction with the proposed London and York Railway at Newark, is calculated to prove highly important and beneficial to the manufacturing and trading interests of that town; and a subscription was entered into for the purpose of defraying the expenses of obtaining the levels, and taking other necessary preliminary steps for forwarding the objects in view, such subscription to be returned in the event of the railway not being carried out.—A Meeting was held at Faver-ham last week, the Mayor presiding, to consider the various projected lines for supplying Faversham, Sittingbourne, Canterbury, Deal, Margate, Ramsgate, and the coast with railway communication. After hearing the statements of deputations from the South Eastern Company, and from the promoters of the proposed Kentish and North Kent lines, a resolution was proposed, asking the meeting to pledge themselves in support of the South Eastern. This was met by an amendment in the negative, carried by a majority, and the meeting separated after a discussion of five hours.

IRELAND.

Dublin.—The funeral of the late Lady Heytesbury having been arranged to take place in England, the body was conveyed on Friday from the Vice-Regal Lodge to the Meteor steamer, by which it was conveyed to Bristol. It is now said that there is no foundation for the rumour that Lord Heytesbury intends to resign the Lord-Lieutenancy, and consequently there is no truth in the statement which mentioned Lord Ellenborough as his successor.—During the latter part of last week Dublin was visited by violent storms of wind and rain, which did great damage to the buildings and to the shipping in the harbour. It appears also to have been generally felt throughout Ireland.—Mr. Hampton, the aeronaut, made an ascent on Monday afternoon from the Portobello Gardens, the balloon passing over the city in a north-easterly direction. When in the neghbourhood of the North Strand, it was observed descending with great rapidity, and, notwithstanding all Mr. Hampton's exertions, it continued to do so until it came into collision with the top of a house, and struck the chimney, which was thrown down; the balloon at the same time exploding, by some sparks from the flue. Mr. Hampton was thrown to the ground with great violence, and must have been killed if the bystanders had not caught him in their arms. The balloon, which cost 500*l.* a few months since, was totally destroyed.—The weekly meeting of the Repeal Association took place on Monday, Mr. Somers, M.P. for Sligo, in the chair. The meeting was addressed by the Hon. G. H. Hutchinson, Mr. M. O'Connell, Mr. Grattan, and other gentlemen: but the chief feature of the meeting was a very long letter from Mr. O'Connell on the present state and prospects of Repeal. This document has caused some interest in political circles, inasmuch as Mr. O'Connell, after an examination of the merits of simple Repeal and Federalism, declares that he is now disposed to prefer Federalism. The following are extracts from this document:—

"Let me state the principles upon which the 'Simple Repealers' desire to act; and let me show how far the 'Federalists' concur in these principles. The first principle is founded on the determination at all hazards to preserve the connection between Great Britain and Ireland, through the means of the power of a sole executive, and the golden link of the Crown. In this principle both 'Simple Repealers' and 'Federalists' completely agree. The second principle results from the necessity of the Repeal of the Union Statute, 50 Geo. III. c. 47. That statute must be put out of the way legally and constitutionally. In this principle 'Simple Repealers' and 'Federalists' equally agree; both, in fact, being Repealers of the Union, because Federalism can commence only after the repeal of that statute. The third principle arises from the necessity of a reconstruction of the Irish Parliament. This principle belongs in common to both classes of Repealers—'Simple Repealers' and 'Federalists,' because the mere repeal of the Union statute would not answer the purposes of either party. The mere repeal of the Union statute would revive the Irish Parliament without the benefit of any Reform schedules. It would give two members to the ruined Abbey of Tulsk, two members to the Round Tower of Kilcullen, two members to the sands of Bannon, and two members to the churchyard wall of Clonmines. This would never do. 'Federalists' and 'Simple Repealers' agree that this would never do. There must therefore be a reconstruction of the Irish House of Commons. The fourth principle consists in the restoration of the Irish House of Lords in all its integrity. Thus far all parties, 'Federalists' and 'Simple Repealers,' are agreed. There is one distinction which should be clearly understood, and all confusion avoided on the subject—that is, a distinction between the mode of reconstruction of the Irish Parliament and the powers which shall be vested in that Parliament when reconstructed. First, reconstruct your Parliament, and secondly, decide what powers that Parliament shall have when reconstructed. Upon the mode of reconstruction of the House of Commons, the 'Federalists' and 'Simple Repealers' might and ought to agree. It is true that the 'Federalists' have not as yet any official organ, and therefore there is no statement of their views as to that reconstruction. It is also true that it is for the 'Federalists' to suggest their plan of reconstruction of the Irish House of Commons. It is not unlikely that the 'Federalists' and 'Simple Repealers' might agree amicably upon the mode of reconstruction: at all events the discussion upon these points can be, and, I doubt not, will be conducted in a fair, impartial, and amicable manner, and in the absence of heat or violence: discussion, instead of being shunned by the 'Simple Repealers' is anxiously invited by them; they do not desire to dictate to anybody. The Irish House of Commons being legally constructed, a question of great importance arises—the real question between the 'Federalists' and the 'Simple Repealers.' That question is, What shall be the extent of the powers of the Irish Parliament? Both parties are agreed that these powers should be sufficiently extensive to enable the Irish Parliament to protect the lives, liberties, and properties of the Irish people—that it should have power to enact all laws to be of force in Ireland: in short, that it should be an efficient Parliament for all legislative, financial, and judicial purposes, within Her Majesty's realm of Ireland. The 'Simple Repealers' are of opinion that the reconstructed Irish Parliament should have precisely the same power and authority which the former Irish Parliament had. The 'Federalists,' on the contrary, appear to me to require more for Ireland than the 'Simple Repealers' do; for besides the local Parliament in Ireland having full and perfect local authority, the 'Federalists' require that there should be for questions of Imperial concern, colonial, military, naval, and of foreign alliance and policy, a congressional or federative Parliament, in which Ireland should have her fair share and proportion of representation and power. It is right and just to confess that in this respect the 'Federalists' would give Ireland more weight and importance in Imperial concerns than she could acquire by means of the plan of the 'Simple Repealers.' If there were such a congressional Parliament as the 'Federalists' propose, one-third, or thereabouts, of the members ought to be Irish; giving to Great Britain the other two-thirds. But as yet the 'Federalists' have not spoken out. Mr. Grey Porter has promised his project, but the time within which he was to produce it has not arrived. For my own part, I will own, that since I have come to contemplate the specific differences, such as they are, between 'Simple Repeal' and 'Federalism,' I do at present feel a preference for the federative plan, as tending more to the utility of Ireland and to the maintenance of the connection with England than the mere simple repeal. But I must either deliberately propose or deliberately adopt from some other person a plan of federative union, before I bind myself to the opinion I now entertain. The 'Federalists' cannot but perceive that there has been upon my part a pause in the agitation for the Repeal since the period of our liberation from unjust imprisonment; they must perceive that on the part of the Repealers every passion has been hushed, and all the energy of complaint suppressed in the expectation of a federal movement. This calm has been made in compliment to the friends of Ireland who have not yet joined the Repeal standard. We anxiously await their patriotic co-operation. There are two propositions perfectly clear—First, That matters cannot remain as they are in Ireland, but that the Repeal movement must accumulate in power and force in spite of every obstacle. Secondly, That the British Minister cannot conduct the affairs of Ireland upon a Protestant or Orange principle. Violent anti-Poperyism, or violent Protestantism, can no longer be the road to emolument and promotion. The Government can no longer connect itself with a sturdy or active no-Popery man. On the contrary, the Government must necessarily be driven to prefer renegade or courtly Catholics to over-active and over-zealous political Protestants. In short, the hypocrisy of impartiality towards all will necessarily exclude all the violent amongst the remaining Orange party from Government favour. The Government, by or for a mere Protestant party, is at an end; there must be what may be called a 'practical pretence' of liberality, which will necessarily exclude from patronage the over-zealous or over-active amongst the late ascendancy party. In the mean time everything bids fair for the prospects of the Repeal Association. The people of Ireland perceive that the game is nearly won, and that success, though it may be postponed, cannot be prevented. The Irish people also perceive, that if all the non-Repealers do not join us, many are daily acceding to our ranks; and by our combining conciliation with firmness, sincere kindliness with unremitting determination and activity, the Repeal must be carried, and Ireland become a nation again."

After some discussion on an investigation going on at Shinrone, respecting the alleged conduct of the police as Government spies, Mr. M. O'Connell concluded the business of the day by exhorting Repealers not to allow the Repeal rent to ebb away. He then announced the rent for the week to be about 400*l.*

Tipperary.—Two dreadful murders took place last week in this county connected with the disputes about the possession of land. The first was perpetrated on the wood-ranger of Mr. Carden, of Barnane, who had been engaged in serving law processes on the tenantry on the Barnane estate, and had accompanied Mr. Carden in one of his recent visits to the tenantry. He was shot, it appears, on Tuesday, having been missing since then, but nothing was known of his fate till Wednesday, when he was discovered dead near the wood of Barnane. To show the apprehensions of danger under which he laboured, it is stated that he carried a double-barrelled gun and a case of pistols: he was deprived of these arms by the person or persons by whom he was murdered. His head was shockingly mutilated and fractured, both in front and behind. The other victim was a driver or care-taker on the property of Mr. Latouche, near the same locality. The poor man, it appears, was engaged in prayer on his knees, in his own house, on Sunday evening, and about retiring to rest, when he was shot through the body and killed. The cause of this murder is similar to that which instigated the other, deceased having, a few days previous to his murder, seized upon a defaulting tenant, whose effects were to be sold last week for non-payment of rent.

SCOTLAND.

Glasgow.—On Friday a public dinner was given in this town to Professor Liebig, as a mark of the high sense which the inhabitants entertain of his eminent services to science. The Earl of Eglintoun presided, supported by Lord Blantyre, the Lord Provost, Sir J. Campbell, Sheriff Alison, Sir C. Ferguson of Kilkerran, Gen. Sir C. M. Brisbane, Mr. Campbell of Craigie, Rev. Dr. M'Leod, Dr. Gregory, Dr. James Thomson, Dr. Broomhill, &c. The croupiers were Mr. Oswald, M.P., and Mr. Tennant. The health of Professor Liebig having been drank with great applause, the learned gentleman returned thanks at some length, and expressed his warmest gratitude for the reception he had met with.

"My Lords and Gentlemen," he said, "from no men would I esteem such honours—so much above my deserts—more highly than from the agriculturists of Scotland; for it is you who have done most to improve the science of Agriculture, and among whom it may be seen in its most advanced state, and many are now before me who have contributed largely to this progress. Glasgow, also, has been distinguished, since the time of Black, as a chemical school, and has contained, in my distinguished friends Drs. Thomson, Graham, Gregory, and others whom I see around me, illustrious fellow-labourers in Chemistry, whose friendship I have long enjoyed, and highly esteem. The benefits which Science is capable of conferring on Agriculture cannot, I believe, be too highly estimated. It is true, that in an art which engages so many acute minds, great discoveries will often result from accidental observation and experiment, without the suggestion of theory—applications so important, for example, as that of bones for manure, or even lime itself. But how much more likely is experience to be successful when directed on sound principles! Practical experience possesses unquestionable value; but it is like a vessel, to which, in the form of science, the compass or the pilot is wanting. It is a treasure which cannot be inherited. Science enables us to bequeath this treasure to our children, and it enables our children to increase the store. Science gives us the consciousness of our strength, and thus inspires us with courage and energy. Science teaches us to recognise the food of plants, and the sources from which it is derived. This knowledge alone makes us the true masters of the soil—the lords of our capital. We can now see where we are guilty of waste, and where we are too sparing. The great truth that animal manures are nothing else but the ashes of the food produced from our fields, consumed or burned in the bodies of men and animals, has given the chief direction to all modern improvements in Agriculture. Who would have thought it possible a few years ago that gas-works would yield a powerful manure? We now know on what cause the exhaustion of our soils depends—it is the most precious ingredients of the soil which we remove in the crops, and thus impoverish our fields. By analysing the ashes of plants, we learn that we must add or replace, in order to restore the original fertility of the soil. Africa and Peru supply us with the mineral elements of bread and flesh in the shape of guano, and chemical works now produce the other mineral substances which are indispensable to Turnips and Potatoes. It is evident to all that the present age has entered upon a new path; we have now to do with the real, not with the imaginary value of the manure. As we have learned how to measure the value of an acid or an alkali, so we can now ascertain the true value of a manure. This therefore is precisely what we must expend on the soil, in order to obtain a profit; for the capital of the farmer consists of his labour and his manure. Much certainly remains to be done. According to the geological character of the soil, the farmer must decide on the means to be employed for its improvement. The mineral food of the plants of all countries must be ascertained by the analysis of their ashes: we must determine which substances are essential, which accidental—we must endeavour to find out in which plant one ingredient or another may be replaced, as lime by magnesia or potash by soda. Researches with these objects in view I rejoice to say have been undertaken by Professor Graham at the request of the British Association. This information I am glad to learn is likely to be supplied for Scotland by the Agricultural Chemistry Association, an institution reflecting the highest honour on its projectors, and which by employing the able agency of Professor Johnston in diffusing through all parts of the country the requisite information, and in stimulating the agriculturists to continued experiments, promises to lead to most valuable results. I trust you will permit me to regard this expression of your feelings towards myself as a frank and public acknowledgment of all that has recently been done by chemists for Agriculture and Physiology, and as an encouragement to all chemists to persevere in their efforts for the perfecting of these sciences. I thank you in the name of all those whose labours in extending the boundaries of Chemistry, and in diffusing scientific principles, have procured for us your approbation. I now beg leave to propose as a toast, which I am sure you will drink with all the honours, "The Lord Provost and Magistrates, and prosperity to the City of Glasgow."

The Lord Provost returned thanks, and a number of other toasts were drank before the party broke up.

Miscellaneous.

Louis-Philippe at Twickenham.—Our readers are aware that the King of the French last week visited the house at Twickenham which he formerly occupied during his exile as Duke of Orleans. The *Sun*, adverting to the circumstance, makes the following apposite remarks:—"How many stirring recollections—not a few of them of an exquisitely painful character—must have been awakened in Louis-Philippe's mind when he once again stood before the house which many years ago he had occupied during his exile from his native country! Did joy or melancholy predominate in his breast when looking, first on the well-remembered dwelling, and then on the illustrious group by whom he was accompanied, the contrast between his past and present condition necessarily forced itself on his attention, while busy thought travelled back through a long vista of years to the days of his comparative obscurity—days which for weeks and months together rose and set in gloom, and produced scarcely a single auspicious event on which to hang a hope for the future? In all superior minds there is always a touch of pensiveness bordering on melancholy, and we can readily believe that the first sight of his old house raised in the French King's breast emotions rather of sadness than joy, notwithstanding the triumphant position which he now occupies as guardian of the peace of Europe. He could not but have thought, with a sigh, of the friends who once sate with the humble exile beneath that roof—of the brothers who shared his confidence, and were to him as a second self—and more especially of the clever, sanguine Dumouriez, under whose auspices he made his first essay in arms, and who—had he succeeded in his schemes—would have raised him to the throne of France. All these have long since passed away; the winds of many winters have sighed over their graves; and Louis-Philippe now finds himself the chief actor in a totally new scene—conspicuous in an age which in some respects is the direct antipodes to that of his youth and manhood—surrounded by new men, and influencing a new generation, whose political sympathies are little in accordance with those of its predecessor. It is a striking proof of this great Monarch's worldly sagacity that he has been able, at his advanced time of life, to accommodate himself with such flexibility to the altered character of the age. Lafayette, his distinguished contemporary, carried with him to the grave the republican principles which he maintained in youth; Napoleon, ever after his crushing defeat at Waterloo, still held in the Chambers the language of the despotic Emperor;

Charles X. could risk a throne, but could not, notwithstanding the present necessity of the case, abate one jot of his prerogative; Carnot, Lafitte, and Benjamin Constant, all died as they had lived, steady, inflexible advocates of the revolutionary principle of democracy; but Louis-Philippe—who would almost seem to be incapable of deep-rooted impressions—can change with the change of times; uphold Republicanism in youth, and in age task the utmost powers of his intellect to crush it throughout France. Truly, he is an extraordinary man, and—notorious as has been his political tergiversation—we can scarcely find it in our hearts to condemn it, when we remember the benefits it has conferred, and still continues to confer, on Europe. Had Louis-Philippe, like Lafayette, remained true to the Republican convictions of his youth, a war of Propagandism would have commenced in 1830, which would most probably have continued unabated to the present day."

Dr. Wolff.—Letters have been received from Dr. Wolff, dated Bokhara, June 27, and August 1. Their contents exhibit the same magnaminous self-devotion, but stand in melancholy contrast with the idle reports which have appeared lately in the papers. In his letter of the 27th, Dr. Wolff says:—"I have now been already two months in this place, and though five or six times the King has promised to send me instantly to England with one of his ambassadors, I am in the greatest danger. I cannot stir out of the house without a guard of three men. Dil Hassa Khan, the fellow sent with me by the Assoff Addoola, has shamefully robbed, deceived, and outraged me. The Persian Ambassador, Abbas Kooli Khan, is kind to me, but I think he will not have it in his power to rescue me. Nayeb Abdool Samet Khan has extorted from me a writing to pay him 5000 tomauns to effect my liberation. I suspect him that he was the cause of Stoddart's and Conolly's death, in spite of his continual protestations of friendship." "The Ameer is now at Samareand, and I am here awaiting the most fatal orders from the King daily to reach me. It is true that poor Stoddart professed openly Christianity after he had made a forced profession of Mahomedanism. Do for me what you can, as far as the honour of England is not compromised. All the inhabitants wish that either Russia or England should take the country. Do not believe any former reports of my speedy departure, for I am in great danger.—Joseph Wolff." "Bokhara, Aug. 1, 1844.—To all the Monarchs of Europe.—Sires,—I set out for Bokhara to ransom the lives of two officers, Stoddart and Conolly; but both of them were murdered many months previous to my departure, and I do not know whether or not this blood of mine shall be spilt. I do not supplicate for my own safety—but, Monarchs, 200,000 Persian slaves, many of them people of high talent, sigh in the kingdom of Bokhara. Endeavour to effect their liberation, and I shall rejoice in the grave, that my blood has been the cause of the ransom of so many human beings. I am too much agitated, and watched besides, to be able to write more.—Joseph Wolff." The German papers received on Wednesday, contain a letter dated Constantinople, Sept. 25, which would not deserve notice after the important communication which appears above, if it did not state that the Ameer, who, according to Dr. Wolff's letter of June 27, was then at Samarcand, had returned, and manifested great kindness to the Doctor. We therefore presume that the information, whatever may be the authority on which this letter was written, must have been of later date than that transmitted by Dr. Wolff from Bokhara. The following is a translation:—"Constantinople, Sept. 25.—The most recent accounts from Teheran speak again somewhat more favourably for our countryman, Dr. Wolff. The Emir of Bokhara, after his return from Samarcand, sent for Dr. Wolff, gave him a very good reception, presented him with 100 pieces of gold, a horse, a kaftan of honour, and gave him permission to commence his return journey. Nevertheless, people in Teheran had little confidence in the affair, and strongly suspected that the Emir would cause the missionary to be overtaken and murdered on his journey. Of his actual departure we have yet no intelligence. It seems he was waiting until the Persian Embassy, then in Bokhara, should set out. Should he succeed in joining it, his safety may be regarded as secured." Another letter from Constantinople, dated Sept. 19 says:—"I have this instant received a letter from Persia, saying, Wolff writes from Bokhara, dated July 25:—'The Ameer has returned from Kokhan, and presented me with a dress of honour, a horse, and one hundred tomauns, and I hope to set out in a few days for Persia.'"

SPORTING.

NEWMARKET SECOND OCTOBER MEETING.

Monday.—*Match*, 200, h ft, 8st 7lbs each; Colonel Peel's Zenobia beat Lord Glasgow's Sister to Give-him-a-Name by two lengths.—*Handicap Sweeps* of 20 sovs each, for three-year-olds, &c. 5 subs. Lord Stradbroke's Evenus, 4 yrs, 8st 12lbs, beat Mr. Payne's Audrey, 3 yrs, 6st 4lbs, and Mr. Worley's Example, 3 yrs, 6st 11lbs. Won easily by a length.—*Coffee-Room Stakes* of 100 sovs each, h ft. 4 subs. Lord Stradbroke's Boarding-School Miss walked over.—(*First Class*) 50*l.*, for two-year-old colts 8st 7lbs, fillies 8st 5 lbs. Mr. Edwards's Hedgehog beat Lord W. Powlett's c by Jerry out of Zeal, and seven others which were not placed. Won by a head.—50*l.*, for three-year-olds, 7st 7lbs; four, 8st 7lbs; five, six, and aged, 8st 12lbs. Duke of Richmond's Pastoral, 3 years, beat Lord Exeter's Celia, 6 yrs, Mr. J. Drake's Anonyme, 4 yrs, and Mr. Beresford's Aurora, 3 yrs. Won by six lengths.—*Match*, 300, h ft. Lord G. Bentinck's Miss Elis, 5st, beat Duke of Bedford's Oakley, 9st 12lbs, easily by a length.—*Match*, 150, h ft. Duke of Bedford's Minotaur 8st 8lbs, beat Mr. Phillimore's Physalis, 7st 7lbs, by three lengths.—*Match*, 200, h ft. Duke of Bedford's Glen Fishie, 8st 7lbs, beat Colonel Anson's Marquise, 7st 11lbs, by a neck.—*Match*, 100, h ft. Mr. Payne's Walpole, 7st 4lbs, beat Lord E. Russell's Nat, 9st 4lbs, by three lengths.—(*Second Class*) 50*l.*, for two-year-olds, 8st 7lbs, and fillies, 8st 5lbs. Duke of Richmond's br c The Laird of Cockpen beat Lord Lonsdale's Loadstone, Lord Chesterfield's ch f by Hornsea out of Industry, and five others which were not placed. Won only by a neck.—*Match*, 100, h ft. Mr. Greville's Jamaica, 8st 4 lbs, rec. from Mr. Connop's British Farmer, 8st 7lbs.—*Match*, 200, h ft. Duke of Bedford's Prologue, 8st 7lbs, rec. from Lord Exeter's f by Velocipede out of Lucetta, 8st 4lbs.

Tuesday.—*Match*, 50. h ft. Lord Huntingfield's Mario, 5 yrs, 9st 5lbs, beat Mr. Barne's c by Slane out of the Warbler, 2 yrs, 6st 4lbs, by a neck.—*Royal Stakes* of 200 sovs each, 120 ft, for colts, 8st 7lbs; and fillies, 8st 2lbs. 10 subs. Lord Exeter's Algernon beat Duke of Portland's Welbeck, and Duke of Portland's c by Bay Middleton out of Thebes. Won cleverly by a length.—*Clearwell Stakes* of 30 sovs each, 20 ft, for two-year-olds: colts, 8st 7lbs; and fillies, 8st 5lbs. 31 subs. Duke of Richmond's Refraction beat Colonel Peel's Hersey, Mr. Payne's Sir Francis, and five others which were not placed. Won by a neck.—*Match*, 200, h ft. Duke of Bedford's Espoir, 8st 7lbs, beat Lord Exeter's Merope, 8st 7lbs, by a head.—*Cesarewitch Stakes* of 25 sovs each, 15 ft, with 300 added: the second to receive 50*l.*, &c. Course, about two miles and a quarter. Mr. Irwin's Foig-a-ballagh, 3 yrs, 8st, beat Mr. Dawson's Lightning, 3 yrs, 6st 5lbs, and Sir J. Hawley's Venus, 4 yrs, 8st; 23 others started but were not placed. Won in a canter by three lengths: Venus a bad third. Looking at this race altogether, the weights, the distance, the pace, and the ease with which it was accomplished, it is considered to be the most extraordinary performance for a three-year-old that has ever been placed on record. The heavy rain that fell during the whole of the evening was not a more effectual damper than the result of the race; none but those immediately connected with the stable believed it possible that a three-year-old could win at such weights; hence it was looked upon as "coining money" to bet against Foig-a-Ballagh, and the upshot is, that "the ring" is hit to the amount of at least 20,000*l.*, of which Mr. Irwin alone wins upwards of 13,000*l.*

Wednesday.—*Town Plate* of 50*l.*, for three-year-olds 7st 4lbs; four years, 8st 4lbs; five years, 8st 11lbs; six years and aged, 9st 1lb. Winner to be sold for 200*l.* Mr. Booth's Priscilla Tomboy, 5 yrs, beat Duke of Bedford's Robinia, 3 yrs; Mr. J. Drake's Anonyme, 4 yrs; and Lord Eglintoun's Jamie Forest, aged. First a dead heat between Robinia and Priscilla Tomboy; the deciding heat won by half a length.—*Steppingley Stakes* of 50 sovs each. (5 subs.) Mr. Gulley's Old England, 8st 3lbs, beat Duke of Bedford's Prologue, 8st 7lbs, by a neck.—*Bretby Stakes* of 100 sovs each, h. ft., for two-year-old fillies, 8st 7lbs. (14 subs.) Lord G. Bentinck's Longitude, beat Duke of Richmond's f. by Glaucus, out of Estell; Mr. Edwards's Full Sail; Colonel Peel's f. by Slane, out of Mary Ann; Mr. Ford's Fallacy; and Lord Chesterfield's Zabra.—*Match*. 100; Lord G. Bentinck's Prince of Wales, 7st 7lbs, received ft. from Lord Glasgow's He-has-a-Name, 8st.

Thursday.—*Match*, 100*l.*, Lord G. Bentinck's b c Devil-to-Pay, 8st 10 lb, beat Lord Glasgow's f by Retainer, out of Purity, 8 st 7 lb, by three lengths.—*Sweeps*, of 10 sovs each, for two-yr olds; colts, 8 st 7 lb; and Fillies, 8 st 5 lb. Winner to be sold for 40*l.*, &c. Nine subs. Lord Chesterfield's f by Hornsea, d by Sultan, beat Lord G. Bentinck's Duke of Cornwall, and 7 others which were not placed. Won by a head; St. Domingo a good third. Winner claimed.—*Sweeps* of 10 sovs each, for two-yr-olds, 6 st 7 lb; 3 yrs, 8 st 3 lb; 4 yrs, 8 st 11 lb; 5 yrs, &c., 9 st. Winner to be sold for 300*l.* 7 subs. Mr. Copeland's My Mary, 2 yrs, beat Lord G. Bentinck's Chatham, 5 yrs, Mr. Phillimore's Physalis, 3 yrs, and four others, which were not placed. Won easily by a length; Physalis an indifferent third, Ashtead Pet fourth.—*Match*, 200*l.*, Lord G. Bentinck's All-round-my-Hat, 8 st 7 lb, beat Lord Glasgow's c by Velocipede, out of Amulet, 8 st 3 lb, by a length.—*Handicap Plate of* 100*l.*, for 3 yrs old, &c., Lord G. Bentinck's Naworth, aged, 7 st 2 lb, beat Lord Exeter's Crosby, 3 yrs, 5 st 2 lb, and 13 others, which were not placed. Won by a neck, Crosby beating Plantagenet by a neck; David a good fourth.—*Match*, 50*l.*, ft; Mr. J. Anderson's Chance, 8 st 7 lb, beat Lord E. Russell's Nat, 8 st, by five lengths.—*Match*, 200*l.*, h ft, 8 st each; Lord Exeter's Merope received ft from Duke of Rutland' Crenoline.

BIRTHS.—Recently, at Horsendon-house, Bucks, the lady of the Rev. W. E. Partridge, of a daughter, still-born—29th July, at Wereloo, Ceylon, the lady of F. B. Templer, Esq., of a son—5th inst., at the Vicarage, Granborough, Warwickshire, the lady of the Rev. W. J. Wise, of a daughter—9th inst., at Bowdell, Sussex, the lady of Capt. Chester, 90th Light Inf., of a daughter—10th inst., the lady of J. C. Cole, Esq., of Upper Bedford-place, of a son.

MARRIAGES.—On the 8th inst., at St. Mary's, Islington, C. Claridge, Esq., of Her Majesty's Customs, to Julia S. Squires, niece of P. Squires, Esq., Mulbarton-hall, in the county of Norfolk—12th inst., at St. Mary Abbott's, Kensington, W. B. Rix, Esq., of Matching, Essex, to Laura A. Bond, third daughter of the late W. Bond, Esq., of Ashford, Kent—Recently, at St. George's, Hanover-square, W. E. Hayman, Esq., son of C. Hayman, Esq., of Axminster, Devon, to H. M. Rodwell, eldest daughter of Mr. Rodwell, of New Bond-street

DEATHS.—On the 4th of August, of fever, at Dosandah, Bengal Presidency, R. J. Graham, Esq., eldest son of Sir R. Graham, Bart., of Esk, county of Cumberland, Lieutenant 72d Regiment Native Infantry, and Adjutant to the Ramghur Light Infantry Battalion, aged 27—4th inst., Mr. R. Westland, of Dorking Nursery, much respected, aged 58—6th inst., Frances Bryan, the affectionate wife of J. Bedingfield Bryan, Esq., M.D., daughter of P. Palmer, Esq., of Chippenham House, and granddaughter of the late Sir Charles Harcourt Palmer, Bart., of Dawney Court, Bucks—7th inst., Mary Elwin, the beloved wife of J. Elwin, Esq., of Pembroke-square, Kensington, aged 43—10th inst., at his house in Bryanston-street, the Rev. T. Lovell, rector of St. Luke's, Middlesex, and formerly Archdeacon of Derry, Ireland, aged 78—10th inst., at Vicarage-terrace, Stratford, Essex, esteemed and regretted, Eliz. Giles, relict of the late Mr. J. H. Giles, of Leman-st., Whitechapel—25th ult., at his house, Lavender-hill, Battersea, Mr. Wm. Pamplin, Nurseryman, deeply lamented by his family, aged 75.

TO SPORTSMEN, TOURISTS, &c.

BERDOE'S SUPERIOR WATERPROOF FROCKS, SHOOTING-JACKETS, GARMENTS for the SEASIDE, &c.—An extensive variety of the above, in new and greatly-improved materials always ready, guaranteed to exclude any rain whatever, and confidentiy recommended to those who regard a respectable appearance, or wish to avoid the disappointment and vexation consequent upon purchasing articles made by slopsellers, and sold by parties not tailors.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, conesistent with true economy, and ultimate satisfaction.—W. Berdoe, Tailor, Waterproofer, &c. 69, Cornhill (north side).

IMPORTANT TO ALL WHO ARE EXPOSED TO THE WEATHER.

SUPERIOR WINTER WATERPROOF WRAPPERS, OUTSIDE GARMENTS of all kinds, SHOOTING JACKETS, &c.—An extensive variety of the above, in new and greatly improved materials (in lieu of the unsightly and vulgar Tweeds), now ready; also of BERDOE'S well-known and much approved VENTILATING FROCK, for all seasons, guaranteed to exclude any rain whatever. As winter approaches, attention is again invited to the Advertiser's VENTILATING WATERPROOF, which renders any garment thoroughly impervious to rain. This fact is established beyond all contradiction by more than six years' extensive and most successful trial.

W. BERDOE, Tailor, Waterproofer, &c., 69, CORNHILL (north side).

NETTING for SHEEP FOLDS, made of Cocoa-nut Fibre, a material known to possess the most extraordinary durability when exposed to alternations of weather. A prize was awarded for this Netting at the meeting of the Royal Agricultural Society at Bristol, in 1842; and it is strongly recommended to the notice of Agriculturists in the Society's Report for that year. It will wear out several sets of tarred hemp Netting, and is so light that a herdsman can with ease carry 200 yards of it.—Sold in nets of 50 and 100 yards long, 42 inches high, by the Manufacturers, WILDEY and CO., 7, HOLLAND-STREET, Blackfriars-road, London.

AGRICULTURAL COLLEGE.

WANTED, for the AGRICULTURAL COLLEGE about to be established at Leopardstown, Ireland, and which it is expected will be opened for the admission of Pupils early in November, TWO HEAD MASTERS—one as AGRICULTURIST, to instruct the Pupils in the Practice and Theory of Improved Agriculture; the other to instruct them in all the branches of an ENGLISH EDUCATION, including Book-keeping, Practical Surveying, and Mapping. The salary proposed to be given to the Head Agriculturist, in the first instance, with a prospect of increase with the success of the Institution, 100*l.* per annum, with maintenance and apartments; to the Head Literary Instructor, 80*l.* per annum, with similar accommodation. The qualifications of applicants will be tested both by reference and examination. Applications will be taken in consideration on the 20th of November.

Application by persons who can give the most satisfactory references both as to moral character and professional ability (none other need take the trouble to apply) to be made to the Secretary of the Agricultural College, at the Office of the *Farmers' Gazette*, Dublin, where all information respecting it may be obtained.

WANTED, in a Nursery near London, A PROPAGATOR and FOREMAN in the plant department, he must have an unexceptionable character for ability, diligence, and sobriety.—Apply to J. Hally, Nurseryman, Blackheath.

WANT PLACES.—All Letters to be post-paid.

TO NURSERYMEN.

AS PROPAGATOR, or FOREMAN & PROPAGATOR.—A steady, active Man, aged 40, who understands the Propagation of all kinds of Nursery Stock, also the whole routine of exotic pot-plant growing, and well understands the propagation and growth of Roses in pots and open ground, and has some knowledge of the retail seed business. A situation in a provincial nursery would be preferable; can be well recommended for ability and moral character.—Direct to O. P. Q., at Messrs. Austin and Sons, Printers and Publishers, Hertford, Hertfordshire.

AS HEAD-GARDENER.—A married Man, aged 27, without incumbrance, who perfectly understands his business in all its branches. Can be highly recommended. His Wife can take charge of a Dairy, if required.—Direct to B. C., Mr. Dovland Salter, Sydenham, Kent.

AS HEAD-GARDENER.—A married Man, aged 36, with one child. He thoroughly understands his business in all its branches, and can have a perfectly satisfactory character from the gentleman he is about leaving, with whom he has lived nearly eight years.—Direct to James Smith, Gardener to E. D. Falkner, Esq., Fairfield Hall, Liverpool.

AS GARDENER.—A married Man, aged 35, who perfectly understands his business in all its branches; also Meadow and Woodland, if required. Can have three years' character from his last situation, and be strongly recommended by other gentlemen whom he has served.—Direct to B. S., at Mr. Bristow's, Seedsman, Knightsbridge.

AS GARDENER.—A single Man, aged 37, who perfectly understands the Pinery, Vinery, Peach-house, together with every kind of Early Forcing; also the Kitchen and Flower-Garden, with the Treatment of Stove, Greenhouse, and Orchidaceous Plants; can take charge of a Park or Meadow-land, if required. Can have the highest testimonials for sobriety and general good conduct.—Direct to A. G., Post-office, Richmond, Surrey.

AS GARDENER.—A middle-aged married Man, without incumbrance, well acquainted with the cultivation of Pines, Grapes, Melons, and Cucumbers, and has also a thorough knowledge of Flower and Kitchen Gardening; he would have no objection to undertake the management of a Park or Meadow-land. His wife would, if required, superintend the Laundry. He has been living in a Nobleman's family for the last nine years, and most unexceptionable testimonials can be given.—Direct to J. Aftrd, Gatton Park, Reigate, Surrey.

AS GARDENER.—A single young Man, aged 24, who thoroughly understands his business, and who would have no objection to make himself generally useful. Can have a good character from his last situation.—Direct to A. B. C., at Mr. Crastin's, Nurseryman, Seven Sister-road, Holloway.

AS GARDENER.—A respectable, active, trustworthy married Man, aged 35, who perfectly understands his business in all its various branches, and can have an unexceptionable character from his last place.—Direct A. W., Messrs. Thomas Gibbs and Co., Seedsmen to the Royal Agricultural Society of England, corner of Half-moon-st., Piccadilly.

AS GARDENER.—A Single Man, aged 30, who thoroughly understands his business in all its branches, and can have an unexceptionable character and recommendation from his employer, with whom he has lived 7 years.—Direct T. H., Post-office, Hampton Wick, Middlesex.

TO LANDED PROPRIETORS.

JOHN DAVIDSON, (late Farm Steward to His Grace the Duke of Norfolk, Arundel Castle, Sussex,) aged 40, and married, is now at liberty to engage with any nobleman or gentleman; he has had great practical experience in draining and reclaiming land, breeding and feeding of stock, building and repairing farm-steadings, and the management of woodlands, having acted as Steward for upwards of 12 years to D. Skirving, Esq., Camptown and Mungoswells, Haddington, N. B., one of the leading agriculturists in East Lothian.—Direct to J. Davidson, 151, Oxford-street, London.

TO NOBLEMEN AND GENTLEMEN.

AS LAND-STEWARD AND BAILIFF.—A middle-aged married Man without incumbrance, a native of Cumberland, where he was bred to Farming on the most improved principles; has had 5 years' experience on an extensive Tillage, Breeding, Grazing, and Flock farm in Herefordshire. The most satisfactory references as to character and thorough practical ability can be given from his present employer and from eminent agriculturists in his native county. The Advertiser is well skilled in book-keeping, and can be at liberty either in two months, or at Candlemas next.—Direct to W. T. R., 32, Fenchurch-street, London.

AS WOODMAN, PLANTER, & GAMEKEEPER.—A middle-aged married Man, who has for near six years filled a similar situation, in one of the first families in Devonshire, would be glad to meet with one of the same description; he can have a first-rate reference from his present employer, whose service he leaves early in November.—Direct to Mr. Alexander Pontey, Plymouth Nursery, Plymouth.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

S. GIRLING begs to refer the Readers of the *Gardeners' Chronicle* to his Advertisement of PETUNIAS, SEEDLING VERBENAS, DAHLIAS, &c., of the 12th October. Danecroft Nursery, Stowmarket, Suffolk.

T. THOMSON begs to inform the Cultivators of the PANSY he is now sending out strong Plants of his New Seedlings, including Pizarro and all the principal leading varieties in cultivation, at moderate prices.—Iver, Oct. 25, 1844.

NEW AND SUPERIOR SEEDLING PELARGONIUMS, RAISED by E. FOSTER, Esq., the Rev. R. GARTH, and Mr. COCK.

W. CATLEUGH begs respectfully to call the attention of Cultivators to the following Seedlings, of which W. C. has the Stock to let out, viz. :—

(2) Robustum	42*s.* 0*d.*	(2) Nabob	42*s.* 0*d.*
Magician	21 0	Vixen	21 0
* Miss Peel	42 0	Shield of Achilles	21 0
Lady Howick	42 0	* Duke of Devonshire	42 0
* Dr. Lindley	42 0	The Cid	21 0
* Phœon	42 0	Oddity	21 0
Rosetta	42 0	Sultana, or Perpetual	10 6

The above splendid Seedlings were raised by E. Foster, Esq.; those marked (2) have gained two prizes, those marked * one prize at the London Horticultural Society or the Royal Botanic Society, and were universally admired, as being new in character, firm in texture, brilliant and distinct colours.

The following were raised by the Rev. R. Garth, but have never been exhibited.

Adela	42*s.* 0*d.*	Lightning	10*s.* 6*d.*
Anna Boleyn	21 0	Mary	21 0
Apollo	10 6	Magog	42 0
Blood Royal	10 6	Nabob	10 6
Cinderella	21 0	Nameless	42 0
Diadem	42 0	South Western	42 0
Gipsey Queen	21 0	Seduisante	21 0

The following splendid Seedling was raised by Mr. Cock; it is a fine bold flower, and obtained one prize at the Royal Botanic Society:—Hector, 21*s.*

NEW AND SPLENDID CARNATIONS.

W. C. has the entire Stock of the following splendid Scarlet Flake, raised by Mr. Low, to let out:—

Catleugh's Lady Broughton, 21*s.* per pair.

The following fine Seedlings were raised by J. L. Puxley, Esq.:

Prince of Wales (purple flake), 21*s.*
Princess Alice ditto 21*s.*
Princess Royal, the finest rose flake yet out, 21*s.*

And other good Seedlings raised by the above gentleman.

C. D. Jersey, Esq.'s fine Seedling Yellow PICOTEES—Beauty, Favourite, La Superbe, Queen.

W. C. has the entire stock raised by the above gentleman to let out.

W. C's Catalogue is now ready of first-rate Geraniums, Azaleas, Fuchsias, Roses, Carnations, Picotees, Pinks, Auriculas, Verbenas, &c. &c.

Hans-street, Sloane-street, Chelsea.

TO CUCUMBER AND MELON GROWERS.

ROBERT COOPER, Sion Nursery, Croydon, will forward the under-mentioned varieties of Cucumber and Melon Seeds, post free, on the receipt of a post-office order payable at Croydon, or postage stamps to the amount.

VICTORIA CUCUMBER, 1*l.* 1*s.* per packet of three seeds, white spine, dark-green colour, short thick neck, very strong bloom, robust grower and prolific bearer; grows from 28 to 34 inches long. N.B.—A seed fruit can be seen at the above Nursery.

MILES'S JEWESS CUCUMBER, 2*s.* 6*d.* per packet of five seeds; STEWART'S RINGLEADER Do., 2*s.* 6*d.* do.; NONSUCH Do., 1*s.* 6*d.* do., a handsome black spine fruit, about 18 inches long; an abundant bearer.

HOOSAINEE MELON, 3*s.* per packet of five seeds; IMPROVED GREENFLESH Do., 1*s.* do.

JOHN SLATER, FLORIST, Cheetham Hill, near Manchester, respectfully calls the attention of the Floricultural Public to his large and select collection of the following Florists' Flowers:—TULIPS, AURICULAS, POLYANTHUSES, CARNATIONS, and PICOTEES; catalogues of which may be had on prepaid application. 12 plants of named Auriculas, of different varieties, for 20*s.*, package included. 20 pairs of Carnations and Picotees, good named varieties, for 20*s.*, package included.

THE TRUE FASTOLFF RASPBERRY.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL & CO. have much pleasure in announcing they are enabled to supply fine Canes of the above highly valuable and much esteemed Raspberry, unequalled for the extraordinary size of its fruit, and richness of flavour.

Those to whom Y. and Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and have been awarded several prizes at various Horticultural Exhibitions during the season. As a proof they have not exaggerated its excellent qualities, Fruit was submitted to Dr. LINDLEY (see *Gardeners' Chronicle* of the 22d July, 1843, p. 502), whose opinion of it is as follows:—

"FASTOLFF RASPBERRY.—We have received from Messrs. YOUELL, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find it merits all that has been stated in favour of its excellence. The fruit that we have received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly, and in long succession."

They also exhibited it on the 1st of August, 1843, before the London Horticultural Society, 21, Regent-street, to which a prize was awarded; and again at the Horticultural Society's Exhibition at Chiswick, July 13, 1844, and maintained its high character, by having a Certificate of Merit awarded it. It would therefore be unnecessary for YOUELL and Co to recommend it more fully, or with greater confidence to the notice of the public, merely observing that it continues in high perfection throughout the autumnal months (vide *Gardeners' Chronicle*, 19th inst., page 703), and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties.

Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom upon the following terms:—

Packages containing 100 Canes	.	£2	0 0
Ditto ,, 50 ,,	.	1	1 0
Ditto ,, 25 ,,	.	0	12 0

Package included.

YOUELL and Co. feel it due to themselves to state that a spurious kind was offered for sale by other parties last season, under the title of "Fastolff Raspberry," the same having no pretensions to the genuine variety; and to obviate a repetition of the like they have appointed the following Nurserymen and Seedsmen as their Agents for the sale of it, at whose establishments may be seen engravings of the Fruit:—Bury St. Edmunds—Mr. R. Pettit; Canterbury—Mr. W. Masters; Carlisle—Messrs. Little and Ballantyne; Chichester—Messrs. Newman and Co.; Cliff Vale, near Leek, Staffordshire—Mr. F. Fox; Cork—Messrs. Haycroft; Doncaster—Mrs. Milan, Seed-shop; Dundee—Messrs. Urquhart and Son; Durham—Messrs. Hancock and Sons; Edinburgh—Messrs. Peter Lawson and Son; Fulham—Messrs. Whitley and Orsborn; Glasgow—Messrs. Drysdale and Co.; Haddington—Mr. T. Dods; Halifax—Mr. W. Throp; Jersey—Mr. B. Saunders; Leeds—Messrs. Ely and Son, Rothwell Haigh; London—Messrs. Flanagan and Son, No. 9, Mansion House-street, and Messrs. Noble, No. 152, Fleet-street; Liverpool—Mr. James Cuthbert, 12, Clayton-square; Manchester—Mr. H. D. Cormack; Nottingham—Mr. J. F. Wood, The Coppice; Peterborough—Mr. John White; Penzance—Mr. J. Fox; Plymouth—Mr. W. B. Rendle; Sheffield—Messrs. Fisher, Holmes, and Co.; Southampton—Mr. James Ingram; Stafford—Mr. J. Sandy; Torquay—Mr. J. Morgan; Wakefield, Mr. W. Barratt; Waterford—Messrs. Fennessey and Son; Wexford—Mr. James Harpur; York—Messrs. T. and I. Backhouse.

YOUELL'S CELEBRATED TOBOLSK RHUBARB, the earliest sort known; fine roots, fit for forcing, 12*s.* per dozen.—Great Yarmouth Nursery, Oct. 24, 1844.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX; and at PARIS.

WILLIAM WOOD AND SON beg leave to offer their extensive Stock of CAMELLIAS, fine Stocky Plants, well furnished with Flower-buds, at the following prices, the selection of Sorts being left to themselves.

Good and Esteemed Varieties	. . .	30*s.* per dozen.
Superior Selected do.	. . .	45*s.* ,,
Superb New do.	. . .	60*s.* ,,

Also a Superb Collection of all the best and newest CINERARIAS, fine Bushy Plants, well adapted for flowering during the winter months.

Very fine Varieties	. . . . .	6*s.* per dozen.
Superior Selected do.	. . . . .	12*s.* ,,
Superb New do.	. . . . .	18*s.* ,,

Plants will be presented to compensate for carriage. Catalogues of the above; also Lists of W. W. and SON'S Collection of FUCHSIAS, VERBENAS, Greenhouse and Herbaceous Plants, may be had *gratis* on application.

Woodlands Nursery, Oct. 25.

SPLENDID NEW SCARLET FLAKE, "STEPHENSON'S HARRIOT."

JOHN STEPHENSON begs to announce to the cultivators of the Carnation, that he has now ready for sending out good healthy plants of the above Seedling, which he does with the utmost confidence recommend for brilliancy of colour, purity of white, and regularity of flake, to be decidedly superior to any flowers of that class.

A Bloom was exhibited at the open Show held at the Coppice, Nottingham, and placed for the *first prize*, (which prize was withheld because it was not entered in due time.)

The following notice appeared in the *Chronicle*, Sept. 14, in allusion to this Seedling:—"The Scarlet Flake was also a *fine* white good high colour, the petals of good texture, and well ribboned."—10*s.* per pair.—A remittance or reference required.

Palmer Lane, York, Oct. 25.

GERANIUM "CELESTIAL."

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, have now ready to send out young plants of their New Geranium "CELESTIAL," which has been so much admired. The flowers being very large, and with a beautiful white throat, it is one of the most conspicuous varieties that has yet been raised. Plants, 10*s.* 6*d.* each.

C. and Sons have also to offer healthy young plants of CAMELLIAS of sorts with flower-buds, at 30*s.* per doz.; larger plants, 42*s.* per doz.; and good plants of the newer sorts, 60*s.* per doz. Also good plants of the best sorts of CHRYSANTHEMUMS, at 12*s.* per doz; larger plants, 18*s.* per doz. The package included in the above prices. A remittance or reference for payment in London will be expected from unknown correspondents.

AGRICULTURAL CHEMISTRY.

RICHARD GRIFFIN & CO., CHEMICAL MUSEUM, Buchanan-street, Glasgow, respectfully call the attention of Agriculturists to the following publications:

1. SIR HUMPHREY DAVY'S COURSE OF LECTURES ON AGRICULTURAL CHEMISTRY. A New Edition, with full Instructions for the Analysis of Soils, and Copious Notes embracing the recent discoveries in this Science. By JOHN SHIER, A.M., Fordyce, Lecturer on Agriculture in the University of Aberdeen. One Vol., 8vo., many figures, 9*s.* cloth.

2. DESCRIPTIVE CATALOGUE of all the Chemical Apparatus and Tests requisite for the Analysis of Soils and Manures, with 62 Engravings. Gratis.

3. DESCRIPTIVE CATALOGUE of a Cheap Set of Chemical Apparatus. Price 31*s.* 6*d.* Adapted for use in Schools where Agricultural Chemistry is taught. Gratis.

The Advertisers undertake to supply all kinds of Chemical Apparatus and pure Tests for Analytical purposes, of the most effective kind, and at moderate prices.

JESSOP'S NURSERY, Cheltenham, Established in 1815, from its extensive connection offers peculiar advantages to Noblemen and Gentlemen requiring Gardeners, Foresters, or Farm Bailiffs, of established skill and reputation. All communications promptly attended to.

ROSES.

H. LANE AND SON'S CATALOGUE OF ROSES for 1844 may be had on application to the NURSERIES, GREAT BERKHAMPSTED, HERTS., inclosing a 2*d.* Stamp. The Catalogue is considerably condensed this season by the omission of many old but well-known and valuable varieties, in order to bring it within the limit of the 2*d.* post charge.

Messrs. LANE and SON beg with confidence to solicit the attention of their friends to their immense collection of ROSES IN POTS; at the same time to observe, that upon reference to the Awards of Prizes by the Horticultural and Royal Botanic Societies of London during the last season, it will fully appear that they are the most successful cultivators of Pot-Roses in the kingdom. They also beg to add, that in consequence of the late favourable autumn their Standards and Dwarfs of the Hardy sorts of Roses were never stronger or better grown than they are this season.—Oct. 25.

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may be had at the Nursery, and of Messrs. WARNER & WARNER, Cornhill, London, after the 7th September.

JOHN CATTELL has now ready to send out two SEEDLING CINERARIAS, viz., Hero of Westerham, 5*s.*, —the richest coloured yet sent out. The following is an extract from the *Gardeners' Chronicle* of April 27th:—"J. C.—Your seedling Cineraria is very attractive; the crimson centre with mazarine-purple termination to the petals is of the richest colours, the petals are rather narrow, but the flower is a good size, and most brilliant and beautiful in colour." And Prince of Wales, 5*s.*; centre blue, petals round the centre white, terminating with a beautiful bright deep blue, and excellent shape. These Cinerarias are strong growers, and of shrubby habit. No collection ought to be without them.

Also two SEEDLING ACHIMENES, viz., Rosea coccinea, 5*s.*—the colour as fine scarlet as the old Coccinea, in growth as strong and more bushy than Rosea, and blooms as early—and Atro-Rosea, 3*s.* 6*d.*, an improvement on Rosea. These two varieties will be found very useful for the June and July Shows; also for growing in small pots. Plants in 48 size pots have been loaded with flowers all the summer; while Coccinea, under the same treatment, only began to flower late in September.

The above can be sent by post. A remittance is expected from unknown correspondents.

J. C. begs to call the attention of the public to his fine stock of superior-grown Standard and Dwarf Roses, which are not surpassed, if equalled, by any other grower; a Catalogue of which may be had on application by inclosing a penny stamp. Also his usual extensive stock of Fruit and Forest Trees, Shrubs, Quick, &c., most particularly of transplanted large and small Laurels, Spruce Fir of all sizes, Hollies, Privet, Yews, Lilacs, and Laburnums; also Ash, Chesnut, &c., for underwood; Larch for Hop-poles, &c.—Westerham, Oct. 24th.

J. D. PARKS begs to announce that he has now ready for Sale a fine variety of LABURNUM INTERMEDIUM. Branches and racemes very long; habit very robust, and vigorous; flowers deeper yellow than the common, something later, and very sweet-scented. Dr. Lindley highly recommends it. Fine Seedling Plants at 4*s.* 6*d.*; Dwarf Plants, at 3*s.* 6*d.*

Fine LAURELS, 5 feet high; do. HORNBEAM, 9 feet or upward; do. YEWS, at 9*d.* per foot in height; do. WEEPING ASH, at 2*s.* 6*d.*, tall stems. Best varieties of Apples at 1*s.*; Trees very strong. Laurustinus and Portugal Laurels, large Plants.—Dartford Nursery, Dartford, Kent, October 24.

NEW PROVIDENCE PINE PLANTS.

ON SALE.—100 good Succession of the above valuable sort, warranted free from White Scale and Mealy Bug. For particulars apply, prepaid, to JOHN BUTCHER, Nurseryman, Stratford-on-Avon.

TO THE LOVERS OF ROSES.
WOODLANDS NURSERY, MARESFIELD NEAR UCKFIELD, SUSSEX, AND AT PARIS.

WILLIAM WOOD AND SON have the honour of submitting to the notice of their Friends and Amateurs, the undernamed truly magnificent Gallica Rose; it has flowered here this season in great perfection, and blooms were forwarded to Dr. LINDLEY, whose opinion appeared in the *Gardeners' Chronicle*, page 464.

MARGARET MARY (Wood's).—"Your seedling, Gallica, is a handsome variety, fine in form, being compact and very double, outside petals finely cupped, in colour it is of a purple rose, of a peculiar and beautiful tinge; it is fragrant, and at its best when fully expanded."

Plants of the above are now ready for immediate delivery. Standard and Dwarf at 5*s.* each. The usual discount to the trade when not less than six plants are ordered at once.

W. W. and Son further beg leave to state that they have on hand a very extensive stock of Roses, at the following prices, when the selection is left entirely to them:—

	Per doz.	Per 100. £	s.	d.
Superior selected standard Roses	24*s.*			
Superb do. do.	30 or	10	0	0
Select dwarf budded do.	12 —	3	15	0
Superb do. do.	18 —	5	0	0
Superior dwarf Roses (on own roots)	9 —	2	10	0
Superb do. do. fine show varieties	12 —	3	15	0
Fine Climbing do.	9*s* and	12 —	2	10	0

Catalogues of Roses and Nursery Stock will be sent gratis on application.

N.B. Plants will be presented GRATIS, in order to compensate the expense of carriage. A remittance, or reference, will be required from unknown correspondents.

TULIPS, HYACINTHS, RANUNCULUSES, ANEMONES, GERANIUMS, AURICULAS, CARNATIONS, and LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment FLORIST TO HER MAJESTY, begs to recommend to the attention of the Nobility, Gentry, and Public his extensive assortment of the above Flowers, which, from the success he has had in their cultivation, he can offer at very moderate prices. He particularly wishes to call attention to the highly-flattering remarks on his Exhibitions of Tulips and Lilium lancifolium this season, in the various papers. He is also desirous of reminding the Nobility, Gentry, and Amateurs, who may wish to add to their collections or ornament their parterres with these beautiful flowers, that this is the best season to make a selection. The varieties of the splendid Lilium lancifolium are particularly adapted for parterres, as, besides being quite hardy, they flower at a time when the Nobility and Gentry are at their country seats, and when flowers are so much wanted. They only require to be known to be universally cultivated. Catalogues can be forwarded by post on application. Foreign orders executed.

THE GREATEST NOVELTY EVER OFFERED TO THE PUBLIC.

RHODODENDRON JACKSONII.—This splendid new hardy Rhododendron is confidently recommended as the most beautiful variety extant; it surpasses in the colours of its flowers the richest Geranium, and is quite a new feature in this noble family. It forces well, is a free bloomer, and of dwarf habit. A truss of flowers was transmitted to Dr. Lindley, who pronounced it "a very compact and handsome variety," with "great richness" in its general appearance, &c. See *Chronicle* of the 6th April last, page 216, "*Rhododendron.—C. L. N.*" To be sent out in March at 10*s.* 6*d.* each.

WM. JACKSON and Co. beg also to call the attention of the Nobility, Gentry, and the Trade to the following rare and valuable Rhododendrons, all warranted true, at the very low prices attached. The plants are from seed, fine and stout, twice transplanted, and ready to send out.

Rhododendron campanulatum, averaging 1 inch 3*l.* per 100.

HYBRIDS

Between R. campanulatum and the scarlet arborea, 2 in.,	3*l.*	p.	100
,, ,, and R. venustum, 1 inch	2*l.*	,,	
,, ,, ,, maximum	3*l.*	,,	
,, ,, ,, nivaticum, 1 inch	7*l.* 10*s.*	,,	
,, ,, ,, Catawbiense, 1 inch	7*l.* 10*s.*	,,	

Usual Discount to the Trade on the above.

Cineraria Celestial, No. 1, 2*s.* 6*d.* each; do. Fairy, No. 2, 2*s.* 6*d.* each; fine plants well established. See Dr. Lindley's opinion in the *Gardeners' Chronicle* of April 6th, page 216, under the letters "*C. L. N.*," and Advertisement of Aug. 24th.

Their new Catalogue is now ready (in which is a list of their fine white and scarlet Rhododendrons), and may be had on application. A remittance or reference will be expected from unknown correspondents.

Agents in London: Messrs. WHITLEY and OSBORN, Fulham Nursery, who have seen the plants.

Cross Lanes Nursery, near Bedale, Yorkshire, Oct. 25.

HERTFORD NURSERIES.

E. P. FRANCIS begs respectfully to inform the Nobility, Ladies, and Gentry, that his descriptive CATALOGUE OF ROSES is now ready for delivery, and will be forwarded gratis upon application, and which comprises upwards of a thousand varieties.

E. P. F. takes this opportunity of stating that he has made an addition of several acres of land, and that his Nurseries now extend over 25 acres of ground, containing a large stock of Fruit and Forest Trees, which are in fine and healthy condition; a fine assortment of Trained Trees, Evergreens, and Flowering Shrubs, all of which may be had upon the most reasonable terms. Catalogues may be obtained with Prices attached. Carriage of all goods paid to London.

TRAINED PEACHES AND NECTARINES.

WM. E. RENDLE respectfully informs the Nursery Trade that he has this season a large stock of

TRAINED PEACHES AND NECTARINES,

strong, healthy, and in excellent condition.—Union-road Nursery, Plymouth, Oct. 25, 1844.

GERANIUMS AT VERY LOW PRICES.

WM. E. RENDLE, having a large stock of the following sorts of GERANIUMS, is enabled to offer them at very low rates.

*** A dozen will be forwarded on receipt of a Post-office order, including hamper, package, and carriage free to the Exeter terminus of the Great Western Railway.

CLASS 1.—30*s.* per dozen, including package, carriage, &c.—Conflagration, Pulchellum, Jersey Maid, Lady Villiers, Fascination, Diomede (Rendle), Symmetry, Thunderer, Dido, Cordelia, Oberon, Favourite, Prince of Waterloo, Jessie, Count D'Orsay, Lord Ebrington, Constellation, Lavinia, Cornish Gem, Attila, DUKE OF CORNWALL, and SUNRISE.

CLASS 2.—24*s.* per dozen, including package, carriage, &c.—Evelina, Gipsey, Witch, Hamlet, Cynthia, Aurora, Creole, Lady Cotton Sheppard, Countess of Mount Edgcumbe, Fair Maid of Devon, Wonder of the West, Portia, Jupiter, Life-guardsman, King John, Sultan, and Princess Royal (Lyne).

CLASS 3.—15*s.* per dozen, including package, carriage, &c.—Camilla, Consort, Van Amburgh, Enchantress, Glory of the West, Ivanhoe, Flash, Queen of the Fairies, Grand Monarch, Amethyst, Wildfire, Mabel, Prince Albert, Nymph, Bridegroom, and Sybil.

All the plants are strong, healthy, and well established, and will be forwarded immediately on receipt of order.

Union Road Nursery, Plymouth, Oct. 25, 1844.

A SPLENDID NEW LATE PEACH.

MORTON'S "WALBERTON ADMIRABLE."—This splendid variety was raised at Walberton House, in Sussex, the seat of R. Prime, Esq. It is a Seedling from the Noblesse, which it much resembles, both in size and colour. It possesses all the fine qualities of its parent, but its great merit arises from its ripening full five weeks later. A specimen of its fruit was sent to Dr. LINDLEY in 1841, from whom were received the highest testimonials of approbation. The tree is a fine, free, and hardy grower; the fruit is full-sized, melting, and excellent-flavoured, rendering it a truly desirable variety, and one which no good garden ought to be without. Good one year's trained plants can be obtained of ALEXANDER WEBB, Nurseryman, Westergate, near Arundel, Sussex; at Messrs. HAY, ANDERSON, and SANGSTER'S, Newington Butts; and also at Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street, London, at 10*s.* 6*d.* each; a few strong plants at 15*s.* each. The usual allowance to the Trade when three or more are taken, and carriage paid to London. Remittance from unknown correspondents is required.

TO THE PLANTERS OF ENGLAND.—TRUE HIGHLAND PINE.

JAMES GRIGOR, NURSERYMAN, Norwich, begs to remind such of the Planters of England as are anxious to enhance the beauty and value of their estates, that he is now sending out plants of this recently introduced and very desirable timber-tree, at the undermentioned prices:—

Single plants, strong and well rooted	6*d.* each.
Strong plants, 20 inches high	5*s.* per 100.
Do. 18 ,,	30*s.* per 1000.
Smaller-sized plants	from 10*s.* to 20*s.* ,,

For introducing this tree Messrs. GRIGOR, of Elgin and Forres, were awarded several premiums by the Highland and Agricultural Society of Scotland, where it is rapidly superseding the common Pine. In its old age it assumes in a great measure the darksome grandeur of the Cedar of Lebanon, and is therefore invaluable for planting in masses throughout the more prominent parts of distant landscapes. Sir Walter Scott describes it as presenting much of "the bold and contorted figure of the Oak;" and the *Quarterly Review* recommends it as an acquisition to churchyards and cemeteries. It is highly esteemed for all economical purposes, on account of the hardness and durability of its wood.

N.B.—J. G. has for the present disposed of all his potted plants; but as the others have excellent roots, there is no risk in removing them. A supply in pots will be ready in the course of next month.

CEDRUS DEODARA, raised from seeds in the open ground, 10*s.* each. Araucaria imbricata, Pinus excelsa, &c. &c. on reasonable terms.

DOUBLE ROMAN and PAPER-WHITE NARCISSUS, 4*s.* per dozen. The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. CORBETT'S, late MR. BARRON'S, Italian and Foreign Warehouse, 18, Pall Mall. Also Dutch Hyacinths, Crocus, Tulips, Anemones, &c. &c. Price Catalogues of which may be had per Post.

TO TULIP GROWERS.—About 1500 TULIPS of first-rate quality, and all named flowers, are now offered at full 50 per cent. lower than they could be purchased in the ordinary way of trade. Owing to the numerous avocations of the Advertiser, they are at present mixed, but the purchaser would have no difficulty in assigning their names when in bloom.—Apply to E. CATLING, Florist, &c., Cambridge.

THE NEW AND SUPERB SEEDLING PICOTEE, "BURROUGHES'S DUKE OF NEWCASTLE."

For particulars of the above, see YOUELL & Co.'s Advertisement of October 12th.

YOUELL AND CO. are also enabled to supply the following superb Picotees, raised by the same gentleman, all possessing first-rate properties, and have been exhibited and obtained first-class prizes at several of the metropolitan Exhibitions of the present year. They are as follow:—

Burroughes's Mrs. Benyon, Red Picotee	7*s.*	6*d.*
,, Lady Alice Peel, Rose Picotee	7	6
,, Miss Jane, Purple Picotee	7	6
,, Mrs. Bevan, Red Picotee	7	6
,, Enchantress, Scarlet Picotee	5	0

CARNATIONS AND PICOTEES.

Y. and Co.'s collection of this beautiful tribe of flowers will be found the most extensive and select in Europe, comprising every known variety of merit. The plants are remarkably strong and healthy, and ready for sending out to any part of the United Kingdom and the Continent at the following prices:

				£	s.	d.
12 pairs extra fine and very superior first-class Show Flowers				2	10	0
25	ditto	ditto	ditto	5	0	0
12	ditto	ditto	Show Flowers	1	10	0
25	ditto	ditto	ditto	3	0	0
14 pairs of Extra fine Show Pinks				0	12	0
25	ditto	ditto	ditto	1	1	0

The selection being left to Y. and Co.

*** For Particulars of their finest imported DUTCH HYACINTHS, &c., see their Advertisement of Oct. 12.

Great Yarmouth Nursery, Oct. 24.

TO CULTIVATORS OF VINES.

ALEXANDER RUSSELL, GARDENER, Turnham Green, begs to inform his Friends and the Public generally that he has for Sale a few dozens of Black Hambro' VINES in Pots, grown from eyes last spring; wood strong, well ripened, and eyes fully developed, and cannot fail to insure a good crop next season, if forced in the pots. To prevent disappointment, early applications will be necessary. Price 5*s.* each.

FUCHSIA "EDINA."

JAMES DICKSON AND SONS beg to inform their Floricultural friends that they will send out early in spring strong plants of the above handsome and showy Fuchsia, which was so much admired during the past season at all the Horticultural Shows at which it was exhibited. Dr. Neill then described it as "remarkable for the size of its flowers;" and its form and colour, as well as habit of plant, are also of a very superior description. Plants, 7*s.* 6*d.* each, postage included.—Inverleith Nurseries, Edinburgh, Oct. 1844.

PLANTS WANTED.

EVERGREEN OAKS in Pots 3 to 5 feet; Common YEWS, 2 to 3 feet; Canadian HOLLIES, 2 to 3 feet; Common FIRS in Pots, 2 to 3 feet; Bupleurum fruticosum, and Variegated HOLLIES; they must be good plants, with prices and every particular.—Address immediately to WILLIAM MILLER, Providence Nursery, Ramsgate, Kent.

CHOICE HYACINTHS AND OTHER DUTCH BULBS.

CLARKE AND CO., SEEDSMEN AND FLORISTS, beg to inform the Nobility, Gentry, and the Public, that their Collection of the above ROOTS have come to hand in very excellent condition this season. Early orders will insure good roots, and to which every attention will be paid. Catalogues will be forwarded Post-free on application.

	£	s.	d.
100 Choice selected Hyacinths, either for pots or glasses, in 50 beautiful named sorts	2	10	0

N.B.—Any Roots purchased or ordered, if not approved of, or found to be unsound, will be exchanged.—The Trade supplied.

86, High-street (opposite the Town-hall), Borough, London.

RICH LEAF-MOULD and PEAT-EARTH.—Several acres of valuable Peat-earth and Leaf mould of a rich quality, to be disposed of. Gentlemen and Nurserymen engaged in the Cultivation of Heaths and American Plants will find the above articles of a very superior kind. They will also be found of great value as dressings upon strong lands.—For full particulars apply to Mr. LAWRENCE, Corn Chandler and Seedsman, No. 18, Piccadilly.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l.* 8*s.* Garden-Lights made and glazed from 1*s.* per foot, at JAS. WATTS'S Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	
Garden Edging	Orange Tubs, Flower Boxes, &c.

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

Sales by Auction.

EXTENSIVE SALE OF NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS beg to announce they have received instructions to sell by Auction, on the Premises, Windmill-lane, Camberwell, on Monday, 28th of October, 1844, and following days, at Eleven o'clock, a most valuable and varied collection of Hardy Trees, Shrubs, American Plants, Evergreens, blooming Camellias, Ericas, &c. Amongst the stock will be found some fine bearing Mulberries, and several hundred of fine straight young plants of ditto. There are also fine Magnolias of sorts, strong Vines in pots, Climbing and other Roses, a first-rate collection of choice American Plants, and other valuable Shrubs, affording a most eligible opportunity for Nurserymen providing themselves with healthy stock. A portion of the American Plants, Shrubs, &c., will be lotted in varied collection to suit all customers. Catalogues may be had of the principal Seedsmen, and of the Auctioneers, American Nursery, Leyton-stone.

ST. ALBAN'S, HERTS.
UNRESERVED SALE OF NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS are instructed by the Executors of the Mortgagee (in consequence of the Estate having been disposed of), to submit to public competition, on the premises, the Key Field Nursery, St. Alban's, on Monday, Nov. 18th, 1844, and following days, at 11 o'clock, the whole of the varied NURSERY STOCK, comprising Fruit and Forest-trees, Evergreens, Ornamental, Deciduous, and American Plants of every variety, and about 3000 Standard and Dwarf Roses, consisting of the choicest varieties; 1,000,000 Quick and Oaks, of different ages; Seedling Beech, Ash, &c., Sea Kale, Asparagus, and Rhubarb, Dahlias, and Herbaceous Plants. The lots will be arranged to suit large and small purchasers. May be viewed one week prior to the Sale. Catalogues 6*d.* each, returnable to purchasers, may be had on the premises, of A. A. DORANT, Auctioneer and Land Surveyor, St. Alban's; of the principal Seedsmen in London, and of the Auctioneers, Leytonstone, Essex.

EXTENSIVE SALE OF A CHOICE COLLECTION OF EVERGREENS, AMERICAN PLANTS AND SHRUBS.

MR. MATTHEWS (of Spital Square) is instructed to Sell by Auction, on the Premises, Boddicot House, Homerton, on WEDNESDAY next, OCTOBER 30th, 1844, at 11, for 12 o'clock, on account of the number of Lots, A LARGE AND VALUABLE COLLECTION OF EVERGREENS, CHOICE AMERICAN PLANTS AND SHRUBS, in great variety; two very superior Greenhouses, 29 feet by 16, and 21 feet by 16, with Flower Stages. A great quantity of Iron Fencing, Forcing, and Melon Frames, several Summer Houses, Iron Garden Seats, and numerous out-door Articles. The complete erection of a most expensive BATH-HOUSE, fitted in an unusually convenient way, with Marble Plunging Bath (Cold or Tepid), Hip and Shower ditto, Dressing Rooms, &c.; the whole of which, with its numerous Pipes and Fittings, will form one valuable Lot (unless in the meantime disposed of by Private Contract), and being detached is capable of removal at a small expense. Also a small Stack of Meadow Hay.

May be viewed until the Sale, and Catalogues had of the Gardener, on the Premises, and (by post or otherwise) at Mr. MATTHEWS'S, Auction and Estate Offices, 2, Spital Square, Bishopsgate-street.

AMERICAN NURSERY, KING'S ROAD, CHELSEA.
To Noblemen, Gentlemen, Nurserymen, Florists, and Others.

MR. KIRKE will sell by Auction, on the Premises (late the American Nursery), King's-road, Chelsea, on WEDNESDAY, OCTOBER 30, 1844, and following day, at Eleven for Twelve o'clock (each day), by order of the Proprietor, the ground being required for other purposes, the VALUABLE COLLECTION, comprising several thousand Aucuba japonicas, Laurels, Laurestinus, Hollies, Box (common and Siberian,) Lilacs, Roses, Poplars, fine standard Mulberries, Yews, a quantity of large ornamental Flowering Shrubs and Evergreens, Yuccas, Orange and Lemon-trees, Greenhouse Plants, &c. &c. (arranged in large and small lots, to suit the convenience of purchasers), and Greenhouses. May be viewed two days prior to the sale. Catalogues had on the premises; of Messrs. GAINES, Seedsmen, Covent Garden; Messrs. T. and C. LOCKHART, Seedsmen, Cheapside, City; and at the Offices of the Auctioneer, 29, Brompton-row, Brompton.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

LAVENDER-HILL NURSERY, WANDSWORTH-ROAD, NEAR LONDON.

During the month of November, will be sold by Auction, unless previously disposed of by private contract, the valuable and healthy NURSERY STOCK of the late Mr. W. PAMPLIN, by order of the Executors, consisting of about Nine Acres of general NURSERY STOCK, particularly abounding in the Finest HARDY EVERGREENS, of all sizes; FRUIT-TREES, SHRUBS, and PLANTS; Large and Small CAMELLIAS, an extensive Collection of FERNS (some of extreme rarity); Erection of Greenhouse, Garden Frames, and Lights; Garden Implements, Shop Fixtures, quantity of Vegetable and Flower Seeds of the present Harvest, including a half-cwt. of best White Spanish Onion, Early Cauliflower, &c. &c.

Due notice of particulars will be given in a future advertisement. Meanwhile, parties contemplating purchasing the Leases of the Premises will be treated with at once, and may learn full particulars, and may inspect the Leases, on applying to Mr. W. J. LOAT, Clapham Common; or to Mr. W. PAMPLIN, Bookseller, 45, Frith-street, Soho.

HANTS.

TO BE LET, with immediate possession, a most desirable TITHE FREE FARM, containing about Six Hundred statute Acres of Arable and Pasture Land, surrounded with good Markets. Also, a good WATER CORN MILL, adjoining the above Farm.

For particulars apply to WILLIAM PADWICK, Esq., Manor House, Hayling, Havant, Hants.

NEW CATALOGUE OF FLORISTS' FLOWERS.

MESSRS. TYSO AND SON'S DESCRIPTIVE PRICED CATALOGUE of their extensive Collection of Tulips, Ranunculuses, Geraniums, Carnations, Picotees, Pinks, &c. &c., for 1845, is just printed, and will be sent, post free, to applicants inclosing two postage labels.

Wallingford, Oct. 26, 1844.

BROMPTON-PARK NURSERY AND SEED ESTABLISHMENT.—ESTABLISHED 1681.

MESSRS. GRAY, ADAMS, AND HOGG have much pleasure in directing the attention of their numerous customers to their extensive NURSERY STOCK, consisting of Dwarf and Standard Maiden and Trained Fruit-trees, Figs, Vines, &c. &c., all of which are this season of a very superior description, and will fully maintain the reputation this establishment has for such a long period of years enjoyed for producing these articles. The peculiar nature of the soil renders the removal of all ornamental trees and shrubs almost certain, of which there is a select and extensive collection; together with everything that is desirable in the class of Greenhouse and Herbacous Plants.

MARKET GARDENERS are invited to inspect a fine stock of Half Standard Apples, Pears, and Plums, which they will find well worthy their attention.

The SEEDS of this season that have come to hand are generally of a very fine quality, and of which Catalogues will be issued in due course.—Kensington-road, October, 1844.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 26, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

FRIDAY,	Nov. 1	Botanical	8 P.M.
TUESDAY,	Nov. 5	Horticultural	2 P.M.
		Linnean	8 P.M.
SATURDAY,	Nov. 9	Royal Botanic	4 P.M.

THE ACTION OF LIGHT AND MOISTURE UPON CUTTINGS is hardly inferior to that of heat. Let us glance at their action separately.

The moment light strikes a green plant it excites perspiration. Let us imagine that a cutting weighed 20 at daybreak; the uninterrupted action of light upon it during the day would perhaps reduce its weight to 5, unless it is supplied with water to replace that which the sunlight drives off: the effect of this would, of course, be to kill it. But such a result does not often happen to rooted plants, because they are able to suck fluid out of the earth as fast as the sun drives it off from their leaves, and the circulation of the plant is active enough to prevent any part from being exhausted of fluid. If it is not sufficiently active, then we have leaves withered at the end, or branches struck with dryness. But a cutting, having no roots, is unable to contend against the sun's influence, and therefore it must be shaded; for, as we cannot make it feed, we must prevent its wanting food. Thus in tropical countries we learn from Mr. Neumann that cuttings are struck in sheds shaded by straw and watered occasionally; with us the same point is also gained by cutting off the leaves, or a part of them, for they are the chief perspiring organs.

But there is this disadvantage in cutting off the access of light, that roots are formed more rapidly when cuttings are exposed to light than when they are shaded, provided they can be kept alive. It is therefore a great problem to determine how much light a cutting will endure with impunity. The power of bearing light varies from species to species, and is only to be determined by experience. One plant fades presently, because its powers of perspiration are very great, as is the case with the young shoots of most species of herbaceous and shrubby plants; but as they grow older the loss by perspiration diminishes, because their thickened skin opposes a mechanical obstacle, and they can bear more light. It would therefore seem, at first sight, that ripened cuttings must in all cases be preferable to those which are young and tender. Certainly, they are less liable to die quickly; but they are also much more unwilling to root quickly. In fact, notwithstanding the difficulty of keeping very young cuttings alive, they present the only means of striking very difficult species, such, according to Mr. Neumann, as the Cashew, the Mahogany, and the Litchi. We may lay it down as a certain rule that the power of rooting is always greatest in all cuttings when they are first pushing, provided they have light. The misfortune is, that they are so extremely perishable at that time.

Water is our aid in this case. It is true that the sun's influence can have no injurious tendency so long as the roots can drink and the system digest as fast as the surface perspires; and that the reverse is fatal. But the whole surface of a plant absorbs as well as evaporates, and the younger it is the more it absorbs. It is therefore possible to give plants drink by their leaves; and if this is done with skill, the bad influence of the sun is prevented. In that case the cutting has time enough to make roots, by which its grosser food may be conveyed to it. Hence has arisen the practice of striking plants under bell-glasses, fitting tight to the soil on which they rest. Ignorant people believe that the use of a bell-glass is to keep out air, which is impracticable and useless. Bell-glasses act by keeping in moisture. From the surface of warm damp soil water is perpetually escaping in the form of invisible vapour; if the soil is freely exposed, that vapour is dispersed as fast as it is formed; but when it is confined beneath a bell-glass the air is unchanged, and the vapour remains in a state of suspension, bathing and invigorating the whole surface of the cuttings. If this is well managed the whole of the injurious effects of sunlight are prevented, and all the advantages of it secured.

But it is not sufficient to place cuttings under a bell-glass with a moist soil and a due supply of bottom-heat. Two other things must be considered: the one is, to preserve the external air in a uniform state; the other is, to take care that the soil is not too wet.

If the air on the outside of the bell-glasses is not as warm as that beneath them, or warmer, the moisture floating in their interior will condense on the sides of the glass and run down, by which means the air that surrounds the cuttings will fluctuate as to the quantity of water it holds suspended; and if the external air is much colder than the internal, will, in fact, be dry, instead of damp. In their delicate state tender cuttings will not bear this; it is of the utmost consequence to them that all the conditions to which they are exposed, except light, should be perfectly steady.

The condition of the soil as to water, is also of infinite importance. If it is wet, cuttings are apt to rot. If dry, they are sure to fade. When a cutting is placed in a wet medium, it may attract more water than it can digest; in that case its fluids will become putrid, and its solid fabric must decay. It is therefore indispensable, in all delicate operations, that the soil should be of such a nature as to be incapable of holding much water between its particles; and hence the value of silver sand, the most favourable of all the materials within a gardener's reach. Nevertheless, there are some hard-wooded plants which will not only bear an excess of water but are the better for it. We have seen the common Ghent Azaleas struck by placing a cutting of the young wood, with a heel to it, in a bottle of water, inclosed within a large Ward's Case, none of the leaves having been removed. In such plants as the Azalea, however, it is to be observed, that the dense texture of the wood prevents the introduction of much water at a time, that the cuttings are very slender, and the leaves very large. Plants that are differently constituted can bear no such treatment. Let it be tried with a succulent plant, and the cutting would be rotten in a week. Succulent plants, indeed, will generally do best where there is no more moisture in contact with them than what the air holds suspended. When they are gummy, or milky, or resinous, it is necessary to let the end which is to be plunged in the ground become dry, so that the mouths of the veins may contract, and thus hinder the too rapid introduction of water. Mr. Neumann's mode of doing this is ingenious. When he takes off cuttings of Araucarias, Euphorbias, Vaheagummifera, and such plants, he plunges them in a pot, in damp earth, not pressed down, with their lower end upwards, so that the latter only is exposed to the air, the whole head being buried. By this means he dries the wound, without allowing any of the water of such cuttings to escape. After leaving them for 24 or 36 hours, or even more, he wipes the end, so as to remove the gummy matter that has exuded, and then puts them in again in the usual way, when they take, and the more freely according as the wound is neatly made.

One observation more and we have done for today. It is known that plants possess some quality analogous to animal irritability, to which, for want of a better, the name of excitability has been given. In proportion to the amount of excitability in a given plant is the power which its cuttings possess of striking. The great promoter of vegetable excitability is heat. Therefore the more heat a given plant has been exposed to, within certain limits, the more readily its cuttings will strike root. This explains what seems to have puzzled Mr. Neumann. "The young wood," he says, "of trees growing in the open air will not do for cuttings; and yet, if those same trees are forced in a hothouse, their cuttings are almost sure to succeed. Physiologists have not discovered the cause of this singular phenomenon. Many attempts have been made to strike cuttings from trees growing in the open air, but without success. If, for instance, we take an old branch of Pawlovnia Imperialis, in the month of March, and put it into earth, or tan, or even water, in a stove with a good temperature, its buds will soon appear, and as soon as they are long enough to make herbaceous cuttings, will strike freely. But if you take them as they form upon a tree exposed to the open air, they will not grow at all." Vegetable excitability, a most important attribute, but little thought of, is the obvious explanation of this fact; with which, however, we were not previously acquainted.

MILTONIA SPECTABILIS.

THE following is the way in which I cultivate this plant; and, in the first place, lest some people may imagine that the accommodation here for stove plants is large, and the mode of heating, &c., conducted on the newest and most approved principles, I may mention that all the convenience I have for growing specimen stove plants consists of a shelf which goes round the ends and front of a Pine stove; the whole length of this, including the ends, is 38 feet, and 2 feet in width. I have not, therefore, room for growing even Miltonia spectabilis to half the size that, with increased accommodation, I conceive might be very easily accomplished. This house is heated by common brick flues, with covers of the same material, each cover having a cavity an inch in depth, for holding water, with which they are generally filled three times a day, excepting in winter when the weather is foggy, or the frost severe, when I consider that a very humid atmosphere is injurious, especially to Orchidaceæ that are making young growths. In winter, when the weather is cold, the thermometer is allowed to fall to 55°, and in very mild weather it is allowed to rise as high as 70°; but from 60° to 65° may be stated as the general winter temperature. In summer the thermometer is allowed to vary from 65° to 80°, but from 70° to 75° is our ordinary summer temperature. In warm weather air is admitted freely by the top sashes; in cold weather it is very sparingly admitted, and when we have severe frosts, accompanied by high winds, I give no air unless the sun-heat is strong. In the selection of soil for Orchidaceous plants, as many of them are in their native localities found in shady forests, where decomposed leaves, incorporated with vegetable fibre, are likely to form the principal ingredients in which the terrestrial species naturally grow, I made choice of material from a wood where decomposed leaves are in some places to be found from 1 inch to 4 inches in depth, thickly covered with Luzula maxima, and completely matted with its roots. This material I use in a fresh and rough state, merely divesting it of the green stems of the Luzula, and pulling it into pieces suitable for filling up between the ball of the plant and the sides of the pot into which it is shifted. I always mix this material with a small quantity of coarse river sand, and sometimes a few pieces of rotten wood, to keep the whole as loose and open as possible, which I consider of great importance. In this compost there are few Orchidaceous plants which have come my way that do not thrive. I received a single pseudo-bulb of Miltonia spectabilis having two buds beginning to push, in the autumn of 1838. I potted it into a No. 60 pot, in the material above described, which I have uniformly used; in the spring of 1839 it perfected its young pseudo-bulbs, which, in their turn, immediately began to push, when I again shifted the plant into a larger pot; as the young shoots lengthened they showed a tendency to grow to one side of the pot. I pegged them round in the opposite direction, as far as I could venture, without straining them too much, in order that the plant might regularly cover the pot. This I have always punctually attended to, once, and sometimes twice a-year, as it was required; in that year (1839) it produced three flower-stems, which I valued more highly than I did the 46 it this year produced, 36 of which being the exact number in bloom when I exhibited it at Glasgow in August last (see p. 573). I cannot state accurately the different sizes of pots into which it has been progressively shifted, as in that respect I have been entirely guided by circumstances; but I am perfectly certain that I got it at the time, and in the state above described, that it was first put into a No. 60 pot, and that it has since been regularly shifted once a-year, sometimes in spring, and sometimes in autumn, according as the plant required it; for I consider it a matter of little moment at which of these seasons it is shifted; I am certain that in either case it grew equally luxuriantly; it has here always made fresh growth in spring, at which time I shifted it, and it has just as regularly made fresh growth in autumn after it has ceased flowering, at which time I shifted it when I adopted that season; but in both cases I allowed the young shoots to grow from 2 to 4 inches in length before I shifted, which enabled me to peg them down in the place I wished them to occupy. The pot in which the plant is at present growing is 16 inches in diameter. The plant is densely covered with healthy foliage and young growths; many of the latter are now protruding from 2 to 4 inches beyond the rim of the pot. I have not said anything respecting the drainage of the pots, as every one who knows anything of pot-culture must be aware that that is absolutely necessary for all plants, and more especially for Orchidaceæ. In summer I have always supplied Miltonia spectabilis freely with water when the soil appeared dry, and in winter I give no more than I consider necessary to keep the plant in a growing state, which ought to be always maintained. I consider shading from the direct rays of the sun to be of the utmost importance in the culture of this plant, so much so that for some years past, on the approach of hot weather in spring, I tack a piece of thin canvas or cheese-cloth over the place where it stands. I do not remove this until about the end of September, when the sun loses its scorching influence. From the want of proper attention to shading, I strongly suspect the majority of complaints regarding the yellow appearance of Miltonia is attributable to that. In conclusion, I think it but justice to say, that I could have had the plant considerably larger, having in the course of the time above stated taken eight young plants off it, the first of which was detached not more than 18 months after I received it.—*A. Turnbull, Bothwell Castle.*

DISEASES OF PLANTS.—No. V.

[FUNGI.]

WE have, before entering on the true Fungi, to dispose of a group of productions which have been arranged

by botanists under various genera as distinct species, but which are in reality nothing more than a diseased state of the cells of the epidermis.

Erineum Juglandis, to show how the threads arise from the cells of the leaf.

Every one must have remarked the swollen spots which occur so frequently on the leaves of Vines and Walnuts, and if they have had the curiosity to examine the under side of the leaf, they will have found in the one case a woolly mass, at first white and sparkling, but soon becoming brown; and in the other a short white velvety stratum. Productions of a similar kind are very common upon trees, especially of those belonging to the Natural Order Amentaceæ, such as the Birch, Beech, Oak, &c., though by no means confined to them. It is not uncommon for more than one form to be produced upon the same tree—a circumstance which has confirmed many in the notion that they are parasitical Fungi. They are found in all parts of the world, and exhibit in tropical climates many very curious forms far more highly developed and complicated than in our northern regions, where indeed they appear to be most abundant. In Northern America, a few kinds only are found, and those, with a single exception, European forms, and of rare occurrence. The Lime, which in Europe produces them so abundantly, in America has at present not been found to produce a single specimen.

Erineum botryocephalum, after Corda.

In form they vary from that of a simple or jointed thread, through every grade to a beautiful cluster, as in Erineum alneum and E. botryocephalum; or a complicated cellular mass, as in Septotrichum lamellosum.

In infancy they are usually white, though sometimes red or yellow; but they acquire as they grow old rich tints of red or brown—rarely of golden yellow. They occur in all soils and in all situations; and, as in so many other diseases of plants, the causes which favour their development are utterly unknown. If carefully examined, they are found to be continuous with the cells of the cuticle, and they contain a grumous mass of the same nature as that contained by the cells, but acquiring by degrees the tint peculiar to the particular form; on the copper-coloured Beech, the colour of the grumous mass partakes of the rich tint which distinguishes the matrix. That they arise from the cuticle in the same manner as the hairs, is now matter of doubt to few, though new species are still proposed; and within a short time magnificent illustrations have been given of these bodies by Corda, who, however, speaks doubtfully of their nature. A special work is also devoted to the subject, by Fée. They are not accompanied, except accidentally, by any insect, but appear to arise from an excess of nourishment, causing the cells in certain portions of the leaf to swell, and possibly the hairs themselves; and it is probable that they are in many cases beneficial to the plant, exactly in the same way as certain eruptions in the animal kingdom. It is, indeed, possible that when the disease exists to a very great extent, a portion of the sustenance intended for the young fruit is diverted; and I have observed that, in such cases, the leaves sometimes wither prematurely, which must be injurious to the next year's crop.

Septotrichum lamellosum, after Corda.

It has been a question whether the same situations which are favourable to the development of hairs on leaves are so to that of these eruptions. Such, however, does not appear to be the case; nor, supposing them to be mere anamorphoses of the hairs, does it appear to me to follow, as a matter of course, that it should be so. Nor, indeed, does it seem quite certain that they are always over-developed hairs, however analogous they may be to them, or however similar their origin. Some of the productions, indeed, which are referred by authors to Erineum are nothing more than patches of hairs in the axils of the nerves in their normal condition. Where one tree is affected by the disease, it is common for every tree in the neighbourhood to be similarly affected. They depend, therefore, upon certain conditions of soil and climate; and even were these known, it would perhaps be difficult to suggest a remedy; nor, indeed, if the effects be no more prejudicial than stated above, would it be of much importance to do so.

One or two productions of a somewhat different nature are also, without good grounds, referred to Fungi. The little pustular spots which occur upon the smooth bark of trees, as the Alder, and which contain a brown pulverulent mass of a mealy or branny appearance, are clearly nothing but a diseased state of the bark (Hypophlæa), which from some unknown cause is more or less perfectly resolved at these points into its constituent cells. I have seen something similar on a species of Bassia, from Burma, kindly communicated to me by Dr. Lindley, in which a portion of the cuticle and the subjacent cells split off in the form of a lid, leaving a cup behind; but, in this case, an insect may have been at work. A production not very dissimilar occurs on the common Laurel.

Perhaps, with as little reason, some of the bodies occasionally developed in the cells of plants, known, but at present imperfectly, under the name of Protomyces, are referred to the vegetable kingdom. I have not, however, had an opportunity of examining specimens; but in the genus Physoderma, illustrated by Corda, I am distinctly of opinion that the supposed reproductive bodies are mere diseases of the cells; as I believe the bodies in Protomyces to be a diseased state of the contained granules. Turpin was of opinion that such was the case in the important family of Mildew, Rust, &c. But that, in this case, he was wrong, has been amply proved by the researches of Léveillé and Corda.

In the ensuing Paper I shall say a few words on Galls, because, though caused by insects, they are often referred to Fungi; and there is a curious analogy in the forms which they assume, so that they occasionally deceive even practised eyes.—*M. J. Berkeley.*

GLOUT MORCEAU AND BEURRÉ D'AREMBERG PEARS.

These two Pears, of which the accompanying outlines are those of moderate sized specimens, have been hitherto much confused, and therefore, in order that their respective characters may be readily contrasted, the representations of both have been placed in the same view.

No. 1 is the Glout Morceau—No 2, is the Beurré d'Aremberg.

The Glout Morceau has the following synonyms: Gloux Morceaux, Goulu Morceau, Beurré d'Hardenpont, Hardenpont d'Hiver, Beurré d'Hiver Nouvelle, Beurré d'Aremberg (of some), Beurré de Cambron, Colmar d'Hiver, Linden d'Automne, Roi de Würtemberg, Got Luc de Cambron, Hardenpont's Winterbutterbirne, Kronprinz Ferdinand von Oestreich, Stück.

Frequent inquiries have been made respecting the meaning of the word *glout*, now generally adopted as part of the name of this Pear. Van Mons, "Arbres Fruitiers," p. 373, not then aware of the identity, describes the Beurré d'Hardenpont as scarcely distinguishable from the Glout Morceau. In quoting this, Dr. Diel incidentally remarks:—"This Frassbissen" (Glout Morceau) "is, however, unknown to me." Instead of this and similar meanings having reference to *gourmand*, the most appropriate explanation may probably be found in the sense in which the synonym, Goulu Morceau is occasionally employed: thus—*Pois goulu*, according to Chambaud, signifies sugar-peas, honey-peas; the Pear in question may be accordingly termed a sugared or honied morsel. This epithet corresponds with the quality of the fruit. Should a different meaning, however, attach to the word in Belgium, where the Pear in question and its name originated, information respecting such will probably be supplied through the kindness of some correspondent. The syn. Goulu Morceau was recently observed in the catalogue of M. Henrard, of Liege.

The Glout Morceau was raised by Councillor Hardenpont, at Mons. It varies much in its form; sometimes it is, on standards, roundish; but fairly grown on such, the accompanying outline affords a good representation. Occasionally, on walls, instead of obovate, it elongates considerably towards the eye, with an obtusely angular, or somewhat square appearance, and altogether not unlike the form of a Portugal Quince. The flesh is white, exceedingly smooth and buttery, rich and sugary, not the least acidity being detected in its flavour. The seeds appear more perfect than in most fine varieties, and this being the case, they deserve the attention of those engaged in raising seedlings. In some seasons and situations it becomes fit for use in November, in others not till January; but December is its most usual period. The fruit hangs late on the tree; and, in the southern counties at least, is best flavoured from standards. The tree is an abundant bearer, hardy, not disposed to canker. The shoots are dark olive, with prominent, diverging buds. Leaves ovate-oblong, crenated, or, near the extremity of the shoots, serrated, bright green; they may be distinguished by the wavy appearance of the margins. It ought to be in every collection; in various situations, in the open ground; on an espalier it succeeds well; and it highly deserves a south wall.

Beurré d'Aremberg.—*Synonyms:* Duc d'Aremberg, Deschamps, Colmar Deschamps, L'Orpheline, Beurré des Orphelines, D'Aremberg Parfait. It was raised by the Abbé Deschamps, in the garden of the Hospice des Orphelines, at Enghein. M. Noisette, of Paris, introduced to the French nurseries a variety of Pear from the garden of the Duc d'Aremberg, and which was in consequence extensively cultivated under the name of Beurré d'Aremberg; but this proved to be the Glout Morceau, and hence arose much of the confusion which prevailed with regard to these varieties. The fruit of the Beurré d'Aremberg may be distinguished from that of the Glout Morceau by its shorter stalk, generally bent almost at a right angle to the axis of the fruit; the eye is frequently destitute of any remains of the sepals or calyx. The flesh is melting and more juicy than that of Glout Morceau, but not so fine and buttery; and, except in very favourable seasons and situations, there is an acidity of which few approve, but some do prefer it as being refreshing. On this account it is not so well adapted for general cultivation as is the Glout Morceau. In a warm season and good situation its acidity becomes changed, and in that case it is, at maturity, a rich melting fruit. Its general period of ripening corresponds with that of the Glout Morceau. The tree bears very abundantly, so much so, that the fruit is often very small from standards. The wood is not entirely free from symptoms of canker. Shoots clear yellowish brown, sprinkled with small oblong pale brown specks. Leaves oblong, tapering to the apex, somewhat folded, and towards autumn the middle rib is much recurved in many instances. It must be allowed to rank as a first-rate Pear under favourable circumstances; but its merits, on the whole, are inferior to those of the Glout Morceau.—*R. T.*

Home Correspondence.

Pruning Forest Trees.—In last week's Paper, I saw an answer from Dr. Thackeray to some critical remarks of Mr. Billington's on the management of the Nerquis Plantations. Admitting that the trees in the Nerquis Plantations are fine specimens of growth, does it follow that their vigour is solely attributable to the pruning they have had? Certainly not. And in this I entirely agree with "Quercus." Dr. Thackeray's theory may be stated as follows:—1st. That timber is formed by the ascending sap. 2dly. That by pruning off side branches, the quantity of sap supplying those branches is forced into the stem, thereby increasing its bulk. He endeavours to support this assertion by referring to amputations of the human frame as a means of producing corpulency! But the comparison is erroneous, and utterly fails in showing an analogy between the vegetable and animal kingdoms. I can only repeat what has been previously stated in your columns, viz., that, other circumstances being alike, the vigour of a tree is in exact proportion to the amount of foliage exposed to

solar light, and consequently trees growing singly generally contain the greatest amount of timber; but, from the branches having the power of spreading in each direction unobstructed, the bole or trunk, which may be called the marketable part, is often out of proportion to the branches; and this can only be managed to advantage, by tolerably thick planting and judicious thinning afterwards. The branches being thus prevented from taking a strong lateral direction, the plants get slightly drawn, and a proper bole or trunk is formed. Take care to thin whenever their branches interfere with each other, keep a single leader, and prevent strong lateral shoots from forming, by pinching out their extreme points when growing, and whilst the trees are young, and there will be little occasion for using either the knife or saw. Trees will thus be formed with finer timber and of more value than those managed by the most refined dogmas of cutting and pruning that were ever laid before the public.—*John Spencer, Bowood.*—— *Quercus* says—"The Articles in last Number, relating to Forest-tree Pruning—and the Nerquis Plantations, by Dr. Thackeray and Mr. Roberts—are both amusing and instructive; both attack Mr. Billington, and I fear with little advantage either to the respective combatants, or to the Nerquis or other plantations. If Mr. Billington conducted his inspection under the influence of prejudice, and an overweening partiality to what he calls his own system, and gave the public, through your columns, a warped and distorted description of Dr. T.'s plantations and the management of them, he is very much to blame; at the same time, Dr. Thackeray, in "accepting Mr. B.'s premises to overthrow his conclusions," is, according to my opinion, greatly beside the mark. He may be professionally correct in stating that the amputation of a limb from a patient increases the tendency to grow stouter—why? because the nourishing powers remain the same, while, minus a limb, there is less to nourish. The analogy will not hold; for, according to Mr. B., the plant is nourished by that of which Dr. T. deprives it. I agree with neither, yet partly with both; nor do I think Dr. T. happy in the instance he gives of a transplanted tree, to elucidate what I imagine is an erroneous notion, which he "conceives no one can deny—that the various branches Mr. B. would preserve, must appropriate to themselves a certain portion of sap which would otherwise go to the nourishment of the parent stem." In this quotation lies the radical mistake of the pruners—something of a piece with accelerated stoutness of a patient, otherwise healthy, when deprived of his leg. Mr. Roberts's letter goes to show that the ultra-Pontey system is that followed at Nerquis: it shows up Mr. Billington's prejudices, and says that his "system" is wrong; but these gentlemen may each in his turn show up the errors and mistakes of the other, without either being right. I would only beg each of them to study Nature and assist her operations when practicable, but not to violate her in accordance with their "systems," however fondly cherished."

Culture of Tulips.—The best aspect is south-east or south-west; the beds should be upon an open space, 8 yards at least from any wall, to avoid the reflection of the sun. The soil should be free from manure, rich, and rendered light by well-working it. It should be taken from the surface of a field where Corn or Colza has been grown. In August or September this earth should be carefully passed through a sieve. Dig out the beds 3 or 4 feet in depth, and in breadth about 3 feet 4 inches; the length will be determined by the number of plants. Take out all the earth from your beds, and replace it by that mentioned above. Where great attention is paid to the cultivation of Tulips, the beds are inclosed by a frame of wood 4 inches high in front, and 8 inches high behind, which serves to keep up the beds, and to form a plane slightly inclined to the sun. A good effect is obtained by two parallel beds, separated by a path a yard in width, having their surfaces inclined towards each other. Animal manure injures the Tulip; the remedy which has constantly succeeded with me is the "marc of Colza" * reduced to powder. I take out the earth from the surface of the beds about 7 inches in depth, and spread upon the remaining earth 35 lbs. or 40 lbs. of this marc, which I thoroughly mix, and then replace the earth which was taken out. When the bulbs come in contact with the marc, its fermentation favours vegetation, and contributes to the nourishment of the plant. 40 lbs. of marc suffice for a bed 12 yards long.—The above was sent to me by a French gentleman who has been very successful in Tulips. The mode he adopts with regard to the Colza, I imagine might suggest some useful hints. Perhaps some of your readers would be so good as to notice what might serve as a substitute. Would oilcake do?—*H. B. Mason, Brewood, Wolverhampton.* [No doubt.]

Whitney's Composition.—In spring I procured a bottle of this, and applied two coats of it to moderately-thick calico, strained over hoops, to use in place of a hand-glass; it has rendered the calico, after six months' use, so exceedingly brittle, that the least touch tears it; so that it is in effect useless.—*Philobotanicus.*

Planting Pines in Tan.—The following is a reply to "Judex," who seems disappointed at my not complying with certain statements in his communication at p. 524, and who again, in a still longer article, p. 684, insists that he has tried my system of planting in tan, and that it has proved a complete failure. I appeal to the readers of the *Chronicle* whether this is not injustice, as his compost is of his own invention, and quite in opposition to that recommended in my Treatise, pages 59 and 60, where I recommend nothing but pure British tan, on account of its undergoing a slower putrid fermentation than foreign tan; I state that as it decays it is rendered less fit for supplying plants with food, and that those which I had planted in old tan made very little progress. I have discovered this season, however, that old tan well watered with liquid manure is rendered sufficiently fertile for the culture of the Pine. "Judex," in the commencement of his first article, writes as follows:—"Acting under the advice given in Mr. Hamilton's 'Treatise on the Pine-apple,' I planted out, a few days after his work appeared, 24 fruiting plants in tan, or rather tan and decomposed leaves, just what Mr. H. would have selected himself, being tan and leaves that had been at work about six weeks, and just in a decomposing state, mixed with about one-fourth new tan, just to give life to the mass." Now in my Treatise I recommend tan that will be long in decomposing. "Judex" puts his materials in a heap in order to hasten decomposition, and then adds one-fourth new tan to give it life, and states that such a material was just such as Mr. H. would have recommended; he thus misquotes my Treatise, in order to detract from its merits. Had "Judex" said that he had used pure British tan, as my Treatise recommends, and that it proved a failure, I would have attributed the failure to bad management, and not to the merely mixing fresh tan with decomposing matter, although this sours the whole mass. My book nowhere recommends such a compost, and all I want in favour of my system is an open field and fair play; and if I am to discuss its merits, let it be with one who is neither ashamed of his name nor of his residence. I am sure that I have recommended nothing in my Treatise but what has been well tested by long practice. Before I speak of tan, however, first let it be observed that all the results of my threefold advantage system of Pine culture are from plants which had been grown in soil, &c.; and that I merely, in the beginning of my system, recommended tan for trial. I have since tried it, and the result has more than surpassed my expectations. When "Judex's" first article appeared, I invited him to pay a visit to Thornfield, in order to see the largest fruit he ever saw, according to the size of the plant, growing in tan; but possibly he may have been one of the 109 gardeners that have visited Thornfield this summer, as nearly all of them were personal strangers to me, but all of whom signified their approbation of my system, and also bore witness to the fact that equal results were accomplished by plants growing in various composts. The same results may yet be seen; some of the plants are in pots, others are turned out in tan, &c. I, nevertheless, again invite "Judex" to visit Thornfield, and I imagine that he will see the largest Montserrat and Sierra Leone he ever saw; one is ripening, the other is swelling; both were planted in such tan as this locality affords, and let it be remembered that both plants are suckers; the Montserrat is maturing the fifth fruit in four years, from the same plant. I have also now ripening a fruit of the Black Jamaica of tolerable size, notwithstanding that it is the fourth fruit in three years. It is grown in a pot; its predecessor was cut in last December, and weighed 6 lbs. I have stated in my book that I had grown the Montserrat upwards of 7 lbs.; the Black Jamaica generally rather larger, and Enville 8 lbs. 14 oz., all in pots. Now, with these facts before me, and surely "facts are stubborn things," I may state that my system does not at all depend on what kind of material the plants are grown in, provided it is sweet when applied, and kept porous and uniform in regard to warmth and moisture. If the roots are sufficiently supplied with these, I have no doubt but that the Pine would grow suspended from the roof of a Pine-stove. Thus, it will be understood that my system of Pine culture comprehends something more than a mere course of routine management. Perhaps I was the first who completely exposed the absurd practice of disrooting the Pine. I have explained in my Treatise the real habits of the plant, the longevity and multiplying tendency of its roots, which forms the basis of my mode of culture, the results of which prove its superiority over the old system. I contend that the roots are co-existent with the plant; that the first roots formed at the base of the trunk are capable of being preserved so long as the trunk is ensured from the baneful effects of over-heats and sudden changes in the sub-temperature; and the equally bad effects of sub-acids, generally occasioned by using rich soils of not sufficient porosity to admit the influence of the atmosphere, they become soured. I therefore recommend the use of such composts as are capable of maintaining the greatest uniformity of heat, air, and moisture, as being best adapted for preserving the bottom of the trunk and roots in an active, healthy state, which is of the greatest importance to my present system of culture, as the roots are intended to remain for years undisturbed, that the plants may perfect a succession of fruit. Now, as I have stated in my Treatise, that sometimes tan is impregnated with something pernicious to the roots of the Pine, I would advise a trial of the compost given at p. 59 of my book, which I have used with the very best success. In order to further show the fertilising properties of tan, I may state a few particulars, namely, when Vines are planted in a corner of a bark-bed, partitioned off by bricks, to cause the roots to descend along the bottom of the tan in the bed, they grow most vigorously, and produce the most luxuriant shoots imaginable, in nothing but tan; and the number of bunches, and size of berries, are not surpassed by those grown in the richest composts; indeed, I have never tried any plant in tan but I have always found it to luxuriate more than in any other material. I planted a Musa Cavendishii, only about two feet in height, last March, in a corner of the tan-bed; it is now ripening about 70 fine fruit; its growth has been so rapid that all who have seen it are aware that it could not have been surpassed by planting in any other compost. I may state the same of an Ipomœa in the other corner of the tan-bed, which was planted out about six years ago. Again, so much has planting Pines in tan been a favourite in this locality, that the late Mr. Fallows, of Cotten Gate, near Didbury, succeeded so well with it, that he sold his receipt for 5*l.*, about 25 years ago, to several gardeners: one of them has fruited all his plants in tan ever since, and this season I am informed the plants are very fine. "Judex" will find that J. Justice, who published a work on Pines in 1740, (see p. 15 of my Treatise,) practised planting them in tan: he states, "the fruit were larger than those in pots, but not better flavoured." I have sent a specimen of Black Jamaica for the Editor's opinion of its flavour.—*J. Hamilton.* [It was of the best quality, and a most beautiful specimen of Pine-growing.]

Beehive Raspberry.—This has been cultivated in this neighbourhood for some years. I consider it identical with the one advertised by Messrs. Youell and Co., called the Fastolff. In good rich soils it continues bearing until it is destroyed by frost.—*John Spencer.*

Polmaise Heating.—I stated, at page 525 of the *Chronicle*, respecting this mode of heating, that the flue containing the heated air is situated at the back of the house, and that cold air is admitted from without, to keep up a healthy atmosphere; I also, at the same time, pointed out my reasons why such an arrangement would be fatal to any system. No answer has been attempted in explanation of these objections, unless it be the marvellous fact that Grapes were positively cut from this vinery, and exhibited in Edinburgh on the 20th of September! Why, anybody can do that without any heating apparatus at all. Nothing could have been more apposite than to place this system under the protection of him whose researches in Don Quixote had led him to believe that he had discovered the whole art of gardening. It is really quite terrible when he brings his small wit, and his smaller erudition, to bear on any subject relating to gardening. I repeat that, unless something like an explanation is advanced respecting my objections to this system of heating, I shall consider it useless to revert to it again. My only object has been to elicit the merits of the system, if it has any, of which I then was and still am doubtful.—*R. Glendinning.*——*H.* says—"The great results which have attended the system of heating at Polmaise appear to suggest an important consideration, to which, as far as I am aware, no one has yet alluded: it is this—Whether the method now so generally in use of employing hot-water pipes laid within the house, is really that perfect system it has hitherto been considered to be. The advantages of the Polmaise plan appear to consist chiefly in the introduction of fresh air previously warmed; and there can be little doubt that this method, affording, as it does, a free supply of oxygen for the healthful growth of the plants, approaches most nearly to the natural condition of the Vine in those countries where it attains the greatest perfection. There is a strong prepossession, however, in favour of hot water, and every one who has been accustomed to its use will be slow to adopt any other mode of heating; indeed, any return to the now almost obsolete hot-air plans appears a step in a retrograde direction. But then, the nature of the pipe plan almost precludes the possibility of combining with it a supply of fresh warm air: to obtain this desideratum, therefore, and at the same time not to forego the advantages of hot water, recourse must be had to some of those modifications of the pipe system in which the air is heated before it enters the place where the temperature is to be raised. If any one has tried this plan, will they state with what result?"

Mr. Hoare's Vine Border.—Mr. Hoare, in his recent Treatise on Vine Borders, has especially drawn our attention to this important point more than any other writer on the same subject, and on that account deserves our thanks. Perfect drainage, and the exclusion of long continued rains, has been well understood by our best practical gardeners; but I think the exclusion of soil entirely from forming any part of the material necessary in the formation of a compost for the roots is a new doctrine, and an assumption opposed to our knowledge of horticulture, both practically and theoretically. The Vine may like to ramble amongst stones, lime rubbish, and such like, but our experience of the nature and habits of this plant is, that it delights in rich pasture, especially when subjected to the artificial treatment and temperature it usually undergoes, to produce such magnificent fruit as we annually see exhibited at the *fêtes* in the garden of the Horticultural Society. Soil intermixed with a portion of manure, will be more likely to attain the result just stated, than the absence of both. This may be considered mere prejudice; theory is all very well, but good practice with me has the preference. It is a question of some importance, and worth ascertaining, whether Mr. Hoare ever has produced by his system of prepared borders, Grapes superior, or even equal to those we witness every year at Chiswick, and which we know are the result of the old repudiated manured borders: for, after all, this is the question. Mr. Hoare is surely aware that the Grapes produced in this country in our vineries are not only equal, but, in the great proportion of instances, superior to those grown in the latitudes where the Vine is extensively cultivated, to which Mr. H. so often refers. I shall say nothing respecting Mr. H.'s recommendation of paving the border with brick or tile; we old-fashioned gardeners like to keep stirring the soil.—*R. G.* —— In the Editorial remarks on Mr.

* Colza is a kind of Rape grown near Caen, in Normandy, from which oil is made. What is meant by the marc, is the residue after the oil has been expressed.

Hoare's Columnar Vine Border, you have not expressed any opinion on the effect 12 or 14 degrees of frost, which is of common occurrence, would have on the roots exposed on every side to its chilling effects. I should imagine this would at once prove a settler. —*John Spencer.*

Extensive Robbery of Auriculas.—The premises of Mr. Middleton, of Prestwich, near Manchester, were entered on the evening of Tuesday, the 15th inst., or early the following morning, and the whole of his valuable collection of blooming plants were stolen therefrom. From inquiries which were subsequently made, suspicion fell upon a person of the name of John Scholes, who is a dealer in Auriculas, Carnations, Pinks, Polyanthuses, &c., and who resides at a place called Tonguelane, near Middleton. Under these circumstances, a party was deputed to call upon him for the purpose of inspecting his plants; and, from what he observed, no doubt was entertained that the guilty party had been discovered. Information was forthwith given to the police, and, accompanied by Mr. Middleton, Scholes's garden was searched, and a number of plants were identified. He was immediately taken into custody, and on Friday, the 18th inst., was charged before the magistrates with the robbery. He expressed his surprise and indignation at the charge, and he alleged that many of the plants had been in his possession five or six years. The prisoner was remanded, and afterwards liberated on bail. On the same day his dwelling-house was searched, when the whole of the plants (with the exception of about a score, amongst which was a Freedom, a Ne plus Ultra, and a Colonel, remarkable in consequence of a leaf being cut across, which could not be removed without injury) were discovered under his bed, and the missing plants were admitted by him to have been sent away the Wednesday previous. The prisoner was again brought before the magistrates on the 22d, when, being asked what he had to say, replied, "I am Guilty." The magistrates consulted, and the prisoner was ordered to pay 3*l.* 11*s.* 6*d.*, with a penalty of 5*l.*, and in default thereof to be imprisoned 3 months. The accuracy of the above account is vouched for by Mr. Watkinson, Seedsman, Manchester; Mr. Lodge, Nurseryman, Broughton; Mr. Slater, Florist, Cheetham-hill.—— I think it right to call your attention to this case for these reasons:—First, that the delinquent should be exposed to the fullest extent; and secondly, that the attention of the public should be drawn to the state of the law with reference to such cases. If a poor person, to satisfy the cravings of nature, steal so much as a piece of bread, he is at once seized, and presently imprisoned for a considerable period; but should a party, as in the present case, steal property to a considerable amount, in plants, the law says such a party is not guilty of a felony, and is only liable to pay the value of the stolen plants, with a penalty not exceeding 20*l.*, or, in default, to be imprisoned for a period not exceeding six months. It certainly appears to me extraordinary that such a state of things should be permitted to exist; and I, with other floricultural friends in this town and neighbourhood, deem it our duty to lay these facts before you, trusting that they will elicit such remarks as the justice of the case requires.—*Manamiencis.*

Miscellaneous.—*Nemo* asks, in last week's *Chronicle*, how to rid his aviary of mice. The only plan I find to answer here is, when I find them troublesome, to take up all the food of a night, and set traps; those set with thread, and baited with toasted cheese, or such as canaries are fed with, are the most suitable. The trap consists of holes, with a spring wire, which catches the mouse by the neck when he has gnawed t he thread through. A cat would declare war against the birds.—*P. Frost.* —— *Calceolarias.* —I have observed that my friends mention the difficulty of striking Calceolaria viscosissima. If they would put in their cuttings now, in cutting-pots of sand, plunged in a very gentle bottom-heat, kept well shaded in sunny weather, and close during the day, but give a little air every morning to dry off damp, they would find there is no plant more easily propagated. Indeed, I never put in cuttings of Calceolarias of any kind till October, and never fail.—*P. Frost.*

Cabul Melon-seed.—In your Paper of the 12th October we have noticed a note from Mr. Fleming, in which we understand him to assert that he has never parted with any of his Indian Melon-seed to nurserymen. On reference to advertisement of ours you may perceive that we have offered seed of the Hoosainee Melon warranted true from the fruits exhibited by Mr. F. As his letter will appear to our friends to give the lie to our assertion that the seed was true from his fruit, we must beg you to allow us to contradict him, and to remind him that very shortly after he had shown his fruits, we wrote to him, offering to purchase any seed he might have no use for, to which he replied, that he would not sell any, but that we might have it in exchange for some valuable plants which we had in our possession, we immediately sent the plants, and shortly after received the seeds which we afterwards advertised.—*R. White and Co.*

Societies.

MEETING OF THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

This Meeting, which was held this year at York, was more than usually numerous, and its proceedings, in many of the Sections, were of a highly interesting character. For all that was generally important, we refer to other parts of our columns, and confine ourselves here to the botanical department. However much it may be lamented, the interest and value of the Botanical Papers in the Association have been gradually falling off, and there were never, perhaps, fewer botanists, and a smaller number of Botanical Papers, than on the present occasion. The cause of this is very obvious—botanists are not zoologists, nor zoologists botanists—and the mixing up zoology and botany in one Section has at last ended in the almost entire exclusion of botany from the consideration of the Association. A day was, however, set aside for the discussion of Botanical Papers alone, and we have been enabled to obtain ample abstracts of the most interesting of them. The following Papers were read by the Secretary, Dr. Lankester, from Chevalier Schomburgk:—

"*Alexandra Imperatricis.*—This tree, one of the most gorgeous and beautiful of the extensive tribe of Papilionaceæ, was discovered by the author of this Paper at the foot of the northern ridge of sandstone mountains, in the fluvial basin of the river Cuyuni, in Guiana, and reaches a height of from 100 to 120 feet. The flowers appear directly from the woody branches in large clusters; the racemes, pedicels, and calyxes, are of a rich crimson, the petals bright orange, striped with crimson; the vexillum of a deep purple, and ascending; the pod, which is from 18 to 20 inches long, is of a velvety brown outside, and contains several seeds of a chestnut colour.

"*A New Barbacenia.*—Few regions in Guiana offer to the botanist such a rich harvest as the table-land from which Mount Roraima rises to a height of more than 7000 feet above the sea, the last 1500 feet presenting perpendicular walls, formed of sandstone. In these regions, under the 5th parallel of north latitude, and about 4000 feet above the level of the sea, I discovered the plant which is the subject of this Paper, and which surpasses any other of that interesting group—the Velloziæ—hitherto described, in size and beauty. It reaches frequently a height of 10 to 12 feet, branching out in a dichotomous manner, and bears a number of flowers which in their appearance are liliaceous, and 5 to 6 inches long; the slender tube, covered with callosities, has a purplish tint; the perigon is inside snow white; on the outside, however, a delicate purplish tint spreads from the middle towards the margin. The fragrance of these flowers is delightful, and the plants which produce them extend in groups for several hundred yards.

"*Barbacenia Alexandrinæ.*—This plant, with precisely the habit of some of the frutescent Velloziæ, has the perigonial leaves united into a tube above the ovary, as in Barbacenia. It differs from the species of that genus hitherto described, in the number of stamens, which are 18, all fertile; whilst, in the Brazilian Barbaceniæ the two lateral stamens of each bunch are sterile, and usually described as branches of the filament. These differences in the number of stamens are not, however, admitted to be generic in the closely-allied genus Vellosia, and are therefore insufficient to distinguish generically a solitary species of Barbacenia, and should be considered, therefore, merely a good sectional character. I have dedicated this new species to the Empress of Russia, the sister of my Sovereign.

"*Calycophyllum Stanleyanum.*—How splendid our Rose bushes under the temperate zone! That favourite plant, alike cultivated by the rich and the poor, how they ornament the garden and adorn the hedges surrounding our fields, when in full blossom! Let, then, imagination convey you to the great garden of Nature in Guiana, clothed in tropical exuberance; and among those productions of a congenial sun and fertile soil, imagine trees from 40 to 50 feet high, presenting a mass of leaves of the colour of our favourite flower, from a deep pink to the lightest rose, and imagination may assist to give a picture of the Calycophyllum Stanleyanum. There are several genera of the natural family of Rubiaceæ, as Calycophyllum, Mussænda, Pinckneya, &c., where one of the teeth of the calyx expands in a petioled coloured leaf of a membranaceous texture. In the tree under description, this is the case in such a remarkable way that these bract-like organs of different shades of rose-colour are so numerous as to cover entirely the green leaves, and give the whole landscape a peculiar aspect, which appears *couleur de rose.* It is worthy of remark that the bract-like leaf of the calyx only forms itself after the flower has dropped off, and grows with astonishing rapidity. I discovered this beautiful tree on the banks of the rivers Rupununi and Takutu, in the 3d parallel of north latitude; and I have dedicated it to Lord Stanley, Secretary of State for the Colonies.

"*The Snake Nut.*—In a Paper communicated to the Linnæan Society, and read the 6th June, 1837, and since printed in the "Annals of Natural History," vol. v. p. 202, I attracted the attention of Naturalists to a curious fruit, a Drupa, the kernel of which, when opened, and the membrane which covered it being removed, displayed the striking resemblance of a snake coiled up. I was not able to procure the blossoms of the tree which produces this strange fruit in such an advanced state as to permit me to describe it with accuracy, and considered it at that time as belonging to the order Terebinthaceæ. Shortly before my departure from Guiana, some perfect flowers were sent to me, which rendered it evident that the tree belonged to the natural order of Sapindaceæ; and with the assistance of Mr. Bentham, I have described this curious tree as Ophiocaryon paradoxum. The specific name relates more to the remarkable resemblance of the embryo to a snake, than to its deviation from the general structure of the tribe, which, in the section Dodonæaccæ, presents us already with a spiral and twisted embryo.

"*Lightia Lemniscata.*—Byttneriaceæ are very abundant in Guiana, and during our late expeditions in the interior, we met whole forests of one representative of that family, which no doubt belongs to the most useful and interesting; namely, the Cocoa or Chocolate-tree. Among the Byttneriaceæ which have been added as new discoveries to the list of genera and species of that family during my exploring tours in Guiana, is a plant of high interest, which I have named, after the Governor of British Guiana, Henry Light, Esq., "Lightia." His Excellency took the liveliest interest in our exploring expeditions, and it is but a poor token of the gratitude I feel for his interest, if I name one of the new genera, discovered during that period, after him. The specific name I have derived from *lemniscus*, a coloured ribbon hanging down on garlands or crowns, to which the cluster of flowers with its ribbon-like appendages may be compared. As the regulations of the British Association do not permit a full description of this interesting plant, I shall merely allude here to some peculiarities which this new genus possesses. It is true that the essential character of the order Byttneriaceæ, as described by Lindley, and Endlicher, mentions already, that the petals are variously lengthened at the apex. However, no other instance is known, as far as I am acquainted with it, in Flora's kingdom, where the elongation of all the petals is so considerable as in Lightia lemniscata, suspending like ribbons from the cluster of flowers. The tree, about 20 to 24 feet in height, has much the appearance of a Cecropia, and possesses, like Theobroma and some other genera, the peculiarity of producing its flowers immediately from the stem, below the axis of fallen-off leaves. I have only found three specimens of this interesting plant; namely, the first, while traversing the mountains of the Upper Essequibo, in latitude 2° north; the second, near the river Barima, in latitude 5° north; the third, at the foot of the sandstone mountain of Roraima, in the valley of the basin of the river Cuyuni.

"*Two New Lauraceæ.*—This Paper makes us acquainted with two interesting trees, of which, hitherto, only the trivial name has been known. The first is a tree which has furnished some of the most valuable timber which has been imported into England under the name of Greenheart. Dr. Rodia discovered that the bark and the fruit of this tree contained antifebrile virtues, and though the tree has been described already by Bancroft, in his "Natural History of Guiana," in 1769, it is only now that its botanical character has been ascertained. It proves to be an abnormal species of the genus Nectandra, and the author has given to it the specific distinction, Rodiæi, after the European discoverer of its antifebrile virtues. Dr. Maclagan published a highly interesting account of the Bibirine, a vegetable alkaline body which he extracted from this tree, in the "Transactions of the Royal Society of Edinburgh," vol. xv. part iii., to which the author refers those interested in such matters; but he begs to observe, that if it be true that the Republic of Peru has laid restrictions on the exportation of the true Cinchona, this tree deserves every attention—the more since it is to be found in such abundance at the coast region of Guiana. The second tree is of equal interest, and, like the former, already described by Bancroft and Hartsinck. The fruit was considered by the late Dr. Hancock as one of the most efficacious remedies in diarrhœa, dysentery, colic, and spasmodic pains. It has long been known under the name of the Accawai Nutmeg in the colony, and extensively used as a family remedy in the above diseases, but it is only now that the author has succeeded in procuring specimens of flowers and seeds, which pronounce the tree to be a new species of Acrodiclidium, to which he has given the specific name Camara, by which it is known to the aborigines where it grows. It appears to be restricted to the sandstone mountains of Roraima, between the 5th and 6th parallel of north latitude."

On the Papers being finished, Professor Balfour, of Glasgow, stated that the wood of the Greenheart was used for building vessels on the Clyde. He had heard of the chemical preparation bibirine, obtained by Dr. D. Maclagan, but feared it was not so eligible a preparation as quinine. — Professor Filley, recounted the steps of the chemical process by which Dr. Maclagan obtained bibirine, as well as another alkaloid, from the wood and bark of the Greenheart. Dr. Maclagan had, however, since ascertained that there was but one alkaloid, although he had originally described two, the one being merely a form of the other. The bibirine was not in combination with an organic acid; it had an atomic composition very closely allied to quinine. Dr. Lankester pointed out the necessity of the alkaloids for animal existence. Large quantities of theine and caffeine were daily consumed by man, and these alkaloids very closely resembled quinine and this new salt bibirine, in their composition.

Mr. Babington exhibited to the Section specimens of three plants, which had been added to the list of British Plants during the summer of 1844.

1. *Alsine stricta*, discovered on Widdy-bank Fell, in Teesdale, Durham, by Mr. James Backhouse, of York, and a small party of botanists. It occurred in small quantity, but from the nature of the locality, and the plant inhabiting the northern parts of Europe, it must be considered as an aboriginal native of England.

2. *Carduus setosus*, growing near the shore of the Frith of Forth, in the neighbourhood of Culross. As it is a native of the countries to the north-west of the Black Sea, there is every reason to believe that it has been introduced from that region to Scotland by accident. It has now taken firm hold in that place, where it was detected by Dr. Dewar, of Dunfermline.

3. *Galium Vaillantii.*—This plant has often, and, perhaps, justly, been considered as a variety of the common *G. Aparine.* It has occurred to Mr. G. S. Gibson, of Saffron Walden, Essex, in cultivated fields near to that town.

After the reading of Mr. Babington's notice, Mr. O. A. Moore read a report on the Flora of Yorkshire, written at the request of the Council of the Yorkshire Philosophical Society, and the drawing up of which was intrusted to himself and Mr. Baines, the well-known author of the "Flora of Yorkshire."

He commenced by expressing his regret that owing to the shortness of the time allowed for its completion, it might appear not quite so perfect, in some respects, as it otherwise might have been, especially as regards species peculiar to the seacoasts. All plants, too, were excluded from the list not strictly found on the Yorkshire side of the Tees in Teesdale. In this list were included 1117 species, and 158 varieties (many of which latter are considered species by some botanists), exclusive of a few whose claims to be regarded as Yorkshire plants rest on insufficient grounds. The list might be regarded as an appendix to the work of Mr. Baines, which appeared four years previously, and which contains an accurate and extensive list of habitats for all the principal flowering plants and Ferns of Yorkshire, as well as the Mosses and Characeæ. In the present report the subsequent labours of botanists had been noticed, and about 87 species and 81 varieties were mentioned, which had not previously appeared in any general list. Additional localities were given for some of the rarer species, when only two or three had been previously recorded; and those botanists were mentioned through whose assistance much valuable information on the flowering plants and Ferns of Yorkshire was obtained, to which two families the list was confined. They were distributed into the following classes:—*Exogens*: species 806, varieties 102; *Endogens*: species 262, varieties 35; *Acrogens*: species 49, varieties 21. To this was appended an analysis of the species and varieties in natural orders. The list, which was of considerable length, was then gone through in a cursory manner, the time only permitting the leading points to be alluded to, and remarks were made on such species as were either very rare or had some peculiarity in their habit or mode of growth. The following were a few of the principal additions mentioned in the list:—Anemone apennina, Barbarea stricta; this species was shown to be common in many parts of the county, especially on the banks of the Don, at Doncaster, at York, Smeaton, &c. Its claims to be regarded a distinct species were also pointed out. Camelina dentata, Alyssum calycinum, Lepidium Smithii, Dianthus plumarius, Dianthus deltoides var. glaucus, Silene anglica, Hypericum perforatum β, Hypericum maculatum, Vicia Orobus, Alchemilla alpina, Rosa involuta, Epilobium virgatum, Callitriche platycarpa, C. pedunculata β, Sedum rupestre, Saxifraga geum, Asperula arvensis, Valerianella auricula, Solidago virgaurea β, Artemisia campestris, Crepis succisæfolia, Hieracium diaphanum α, H. Lapeyrousii, H. prenanthoides, H. rigidum α, β, H. boreale, Cuscuta trifolii, Orobanche rubra. This plant was found at Leyburn Shaw, by Mr. Pulleine, and is another instance of the species not being confined to the basalt. Scrophularia Ehrharti, Melampyrum pratense β, Veronica triphyllos, V. Buxbaumii, Mimulus luteus, Mentha aquatica β citrata, M. pulegium, Stachys palustris var. β ambigua, Primula farinosa var. pumila. A curious dwarf variety of this plant, from Hauxwell Moor, was exhibited. Chenopodium olidum, C. ficifolium, C. murale, Atriplex littoralis, A. erecta, A. deltoidea, Halimus portulacoides, Rumex palustris, R. pratensis, R. aquaticus; this plant was shown to be the common roadside Dock, at Hawes Wensleydale, and grew on dry stone quarries, &c. Polygonum mite, Salix rugosa, tenuifolia, Weigeliana, Aceras anthropophora, Habenaria chlorantha, Juncus maritimus, carnosus, obtusifolius, Potamogeton oblongus, plantagineus, Carex paradoxa, rigida, Calamagrostis pyramidalis, Bromus patulus, commutatus, Cynosurus echinatus, Avena pratensis β alpina, Lolium multiflorum, Equisetum Drummondii, Isoetes lacustris, Onoclea sensibilis.

Mr. C. C. Babington commended the zeal, industry, and enterprise of Mr. Baines, in bringing out the "Flora of Yorkshire." In most cases such works failed to pay the author, and he was sorry to find that the re

were still a great number of copies of the "Flora of Yorkshire" on hand. Such works ought to be encouraged, as they were of great importance to the botany of a district. He then made some remarks on the new plants referred to by Mr. Moore, and agreed with him in condemning many of the alterations made in the names of plants published in the Catalogue of a Botanical Society in London.—Professor BALFOUR also pointed out several errors in the list referred to. He stated, with regard to the Orobanche rubra, that he knew that it grew upon the greywacke, and it could not now be regarded as a plant peculiar to basaltic formations. It was parasitic on the roots of Thymus serpyllum.

(To be concluded next week.)

REGENT'S PARK GARDENERS' SOCIETY.

THE further discussion of Morphology at the open meetings in the rooms of this Society took place on the evening of the 22d inst. The meeting was very fully attended. Mr. T. Moore moved, as an amendment to the original resolution (which was in opposition to Morphology, as propounded in Dr. Lindley's "Outlines of Botany")—"That the objections urged against the doctrines of Morphology are neither scientific nor satisfactory, and consequently the principles it maintains are entitled to the further and candid investigation of all those who are desirous of increasing their knowledge of the structure and functions of plants." Mr. Caie seconded the amendment. The meeting was also addressed at some length by Messrs. Sherwood, Maher, Ayres, and C. Moore, in favour of the amendment; and by Messrs. Reid, Fitzpatrick, &c. in support of the resolution. On a division, the amendment was negatived by 18 to 15, about the same number remaining neutral. The resolution was afterwards carried by a small majority.—*M.* [We are not surprised at this result: the ignorance of the opponents of Morphology has been all along so enormous, that it is impossible to reason with them. They are incapable of comprehending an argument; besides, wiseacres always outnumber men of sense.]

COUNTRY SHOWS.

North Devon Horticultural Society, Sept. 18.—This was the Autumnal Meeting. From the garden of C. Roberts, Esq., was a great variety of plants; among which were—Crinum amabile, Achimenes pedunculata, A. grandiflora, Hibiscus Cameronii, Epacris variabilis, Fuchsia exoniensis, Rondeletia speciosa, Begonia floribunda, Cattleya Forbesii, and Russelia juncea. A fine Ixora bandhuca was exhibited, from Castle-hill. Mrs. Col. Mason sent Brugmansia sanguinea. A specimen of Renanthera coccinea was shown, from the garden of E. Roberts, Esq. Several Prizes were awarded, but we have only been furnished with a list of awards without the names of the flowers for which they were given.

Reviews.

Lectures to Farmers on Agricultural Chemistry. By Alexander Petzholdt. 8vo. Taylor & Walton. pp. 300.

AMONG the crowd of books which the present demand for information upon the Chemistry of Farming has brought forth this may be recommended as one entitled to attention. The author does not overload his subject with needless details, which is the vice of some such books, but he confines the reader to those points only which he ought to be well acquainted with, and these he explains in a clear and simple way. He has also selected his experiments judiciously, so that a person who desires to master the elements of the subject may do so without assistance, if he can command a small supply of common agents and unexpensive apparatus.

The author's clear way of treating chemistry may be collected from the following extract:—

"With respect to the opinion that the phosphates of the soil owe their origin to manure, and especially to bones, I may first inquire whence do you suppose the phosphoric acid of manure, or rather of animal bodies, to come? In answer to this, some may say that it is derived from the aliments of which animals partake; others may suppose it is actually created in the animal body. If the phosphoric acid of the animal body be derived from the aliments, how does it become a constituent of those aliments? You see we must go back to that contained in plants, or rather in the soil, and this is merely proceeding in a circle. What really happens is this: carnivorous animals (the lion for example) derive phosphoric acid from the bones and flesh of other animals of the herbivorous class which they devour, these from plants upon which they feed, and plants draw it from the soil; and the presence of phosphoric acid in the soil is owing to the disintegration of rocks. Thus you perceive that phosphoric acid, as well as sulphuric acid—essential constituents of organised beings—are derived originally from the mineral kingdom. The fact that in bone manure you bring phosphoric acid into your fields, does not at all invalidate this conclusion, since all the phosphoric acid of bones once belonged to vegetables, and was by them derived from the soil, and came into the soil by its separation from mineral masses. If, however, it were granted that the phosphoric acid of the animal kingdom could have had some other origin, this would not explain the circumstance that plants which have never received manure, *ex gr.* those growing wild upon soil never cultivated, contain phosphoric acid: this must be referred ultimately to the disintegration of rocks.

"Finally, if any of you gentlemen should have embraced the notion that phosphoric acid could be formed by the transmutation of some other substance, let me assure you that such an assumption is altogether unwarranted. No experiments of any value, no observations worthy of the least confidence, justify the opinion of such a 'creation' of matter. Every theory of this kind rests only on illusion and error, and justly excites the ridicule and scorn of every well-informed chemist; and who but chemists can you admit to be competent judges in questions of this kind?"

The great faults of the book are its want of an Index, which very much diminishes its utility, and the slight way in which some of the more practical matters, such for example as the action of sulphuric acid, are passed over. This, which is one of the most important agents that the farmer and gardener can command, is dismissed in something less than two pages. It might very well have occupied twenty.

To the descriptive *Rose Catalogues* noticed last week, we have now to add that of Mr. FRANCIS, Nurseryman, Hertford. It occupies 18 pages, closely printed, and is divided into, 1. Sorts that flower in May, June and July; and 2. Such as blossom from July till November. To these are added Climbing Roses flowering early and late.

Miscelianeous.

Guano; its Action upon the Growth of Various Plants, Fruits, &c. By J. E. Teschemacher.—The ultimate object of vegetable life appears to me to be the production of seed; to this purpose, and to accumulate the properties and ingredients for the formation and perfection of this seed, the root, stem, leaf, and flower are devoted, each performing its destined gradual part, until, by their united efforts, brought into action by soil, light, heat, and moisture, this object is attained; exterior vegetable action then declines until another season. Experiment has shown that plants grown on mere sand, with the assistance of water, will throw out stem, leaf, and flower, nay, even the forms of seed, but these will be mere integuments, empty vesicles or little bladders; also that by constantly stimulating, with peculiar manure, we can throw plants into such uninterrupted luxuriance of shoots and foliage, that often the flowers, and more often the seeds, do not appear within the limits of the season. Combining these views with others on the production of double flowers, and with some suggested by various experiments on guano, it seems to me highly probable that certain manures are particularly conducive to a luxuriant growth of stem and foliage, while others are peculiarly so to the production of numerous and well-filled seeds. Suppose the nitrogenous (ammoniacal) and alkaline (potash and soda) manures to be those chiefly instrumental in producing stem and foliage, then nitrate of soda will be valuable for this purpose, and if the soil itself contain the ingredients of the seed in a fit state for absorption, the plant thus thrown into a state of luxuriance will be enabled to draw from it sufficient to make plenty of good seed. But if the soil in itself contains them very sparingly, then this excess of stem and foliage, although containing a quantity of nitrogenous and palatable food for cattle, will be deficient in rich seed. Now we know that phosphate of lime and of magnesia, with sulphurous compounds, exist in all seeds useful to man and animals; these, however, do not form part of nitrate of soda and potash, hence the latter can only assist the plant in extracting them from the soil. Suppose, secondly, we use a manure combining the nitrogenous principles in the shape of urates, &c., with the alkaline phosphates, sulphates, muriates, &c., then even on the poorest soil, while the ammoniacal portion is performing its office of causing luxuriance in foliage and stem, the ingredients of the seed are offered in abundance to the root. This is exactly the predicament of guano—most of the salts in which are soluble in water—and those which are not, such as the phosphate and oxalate of lime, become so when combined near the roots with the carbonic acid furnished by the humus as well as by other portions of the manure. The use of a solution of guano in water is therefore good, when the seed is not required; but where it is, the deprivation of the insoluble phosphate of lime is very injurious. Hence, from the proper use of guano, a luxuriant vegetation is followed by the production of a large crop of fine seed. As a farther elucidation of my views, I will state that the manure made use of for the purpose of producing double flowers, is the highly nitrogenous stable manure, which is used in such quantity as to prevent the roots from coming into contact with that part of the soil containing the ingredients of the seed—this manure being then chiefly favourable to the production of foliage alone, if continued through many generations will by degrees convert the stamens, pistils, and the parts destined by nature to prepare the seed, into leaves or petals, and finally obliterate the seed. These flowers, if grown in a poor soil, scarce in nitrogenous substances, will again, as is well known, revert to their normal single seed-bearing state. Several of my experiments with guano proved to me that it shortened the internodes, or portions of the stem between each leaf; this was particularly evident in seedling Orange and Lemon trees, and is a sure indication of fruit or seed-bearing; indeed the spurs, which are well known as the fruit-producing parts of many trees, are but shortened branches where the internodes are reduced to a mere nothing, and where, consequently, the axillary action is concentrated into a small space. I have, therefore, no doubt of the beneficial action of guano on fruit trees. Many experiments are, however, yet desirable. Such as whether guano acts beneficially on the receptacle of the seed, which is the fruit of the Strawberry and Raspberry; whether on the exterior covering of the seed, which is the Apple, Peach, Plum, &c., or on the kernel or nut, or on the pulpy envelope of the seed, as the Gooseberry, Grape, Melon, Gourd, &c. I hope that these ideas will give rise to numerous experiments this year, and that those who make them will not hesitate freely to communicate them for the general benefit. I will merely add farther, that I should consider it advisable, in all experiments on fruits, to try both the guano itself as well as a weak solution of it in water; it is highly probable that the solution will be efficacious where the receptacle or the exterior of the seed is most valuable, whereas in Corn, Peas, Beans, &c., those phosphates which are insoluble in water, and are very necessary, would be thus lost to the plant.—*Hovey's Magazine of Horticulture.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

Orchidaceæ.—The summer culture of these plants is so uniform, and so well explained in former Calendars, that I have said little about them during this season. Now, however, their winter treatment begins. The night temperature may be from 60° to 65° till the middle or end of November, when it should not exceed 60°, for two months at least. Where tanks or gutters have recently been put up to heat this house, a little more heat will be necessary during the first winter, in order that air may be admitted for a few hours every day to carry up the moisture, which is generally plentiful until the new work is seasoned. Our gutters here, now three years old, give no trouble in this respect, indeed, the openings for letting out vapour in summer are not yet shut up. With no other system of heating have I seen Orchidaceæ do better, and with so little trouble. After growing these plants rather extensively for nearly twenty years, and after trying all the materials that have been recommended for growing them in, I have found nothing in which they are more easily managed than in good fresh moss. Respecting the culture of this tribe I shall have something new to recommend by and bye.

Conservatory.—Formerly this house used to be crammed about this time with large specimens of common things, put in to winter; but now it is found that large sheds, or temporary structures, with very little glass, is good enough for winter large Myrtles, Rhododendrons, Chinese Azaleas, Camellias, and a host of other plants with dry or thick leaves from the more temperate parts of the globe, and the conservatory is reserved for all plants that will flower or that can be forced to flower in winter. The present superior system of keeping the conservatory close in winter dates its origin from Mr. Ward's discovery of growing plants in close Cases, and more especially from the appearance of the "Theory of Horticulture," which indirectly ridicules the old mode of taming plants in winter, so to speak. About this time last year I planted a stout Clerodendron fragrans in a border in the forcing-pit, with the new C. splendens by the side of it; the latter I marched on the former, and last May I removed the matched plant to the conservatory, where it now looks as well as the parent plant in the stove. From the hardiness and strong habit of the stock, and being wrought two feet from the ground, I have little doubt that this fine winter-flowering climber will answer my expectation. The circumstance is worth recording, as this is a branch of gardening which is still in its infancy with house plants.

Pits, Frames, &c.—Whenever the weather is mild and dry overhead let the lights be off half hardy plants all day, and leave them tilted at night, to let in air. Close confinement is injurious to these plants at all seasons, and more so now, when newly brought in from the open air. Iridaceæ require very little water after the first dose when they were potted, until they appear above ground, and Oxalises and all bulbs newly potted require the same treatment. A few Amaryllis (Hippeastrum) may now be brought into the forcing-pit; and see that all of them that are to flower on this side of February are not left in cold houses. These bulbs require more heat when at rest than while they are growing; there are many bulbs which will do in the open borders in summer, that go to rest now, and are benefited by being dry-wintered in the stove. Ismene Amancaes (the Peruvian Daffodil) is one of them; Sprekelia, or the old Amaryllis formosissima, is another. Some of the Coburghias are very difficult to flower, and I believe this would be a good treatment for them: indeed, all bulbs and plants that are difficult to flower should be tried widely different to the usual routine. Surely all plants flower freely enough in their native places: the difficulty is, to know the circumstances by which they are surrounded.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

Those plants which require protection from frost through the winter season should now have the frame-work of the protective structure placed over them ready for immediate use, in case of a change of weather. Mats are generally used for this purpose, but a good covering of reed or straw is preferable to them, and not nearly so expensive. The patent Asphalte is also excellent when made fast to frame-work, and will last for several seasons; and the roofing material called Waterproof Felt, would no doubt answer the protective purpose admirably. I last season tried a composition of India-rubber, which was strongly recommended as a substitute for other waterproof materials: it wore excellently through the winter, but the heat of summer has cracked and torn it in a thousand places. Any material that is waterproof, even though it be common tarpaulin, will be preferable to mats, because the preservation of plants from frost depends quite as much upon their being kept dry, as upon their being guarded against the cold embrace of the "Ice King." Plants in borders, such as tender Lobelias, Tigridias, &c. should be removed to a back shed, and covered with sifted ashes or old tan, or the Tigridias may be placed thinly under the greenhouse stage. It is a bad plan to dry these roots, as is the case with imported bulbs, because they rarely arrive at full maturity in this country, and therefore to dry them is to materially injure them. Beds of Fuchsias and Salvias, which are not intended to be taken up, should have their roots covered six or eight inches thick with dry peat earth or leaf-mould, which in ordinary winters is quite sufficient for their preservation. Fuchsias, more than almost any other plant, deserve proper protection through the winter, for they make magnificent autumnal beds.

Pits and Frames.—See to the proper protecting of these structures, and let the plants be kept as dry as possible throughout the winter; give abundance of air both by night and day in mild weather, but do not allow a drop of rain to fall upon the plants.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Should the weather prove favourable, the main bed of Tulips may be planted, though, in fact, any time between now and the first week in November will do. It is possible we may have continuous rains shortly, and bulbs are better in the ground a fortnight too soon, than a week too late. We presume that if our advice has been followed, all offsets and seedlings are already planted. *Polyanthuses.*—Where plants have been permitted to make three or four crowns, standing high out of the ground (which they will do if not divided yearly), cutting roots from the neck of the plant that have assumed a green tint by exposure to the air—these, if worth the trouble, should be parted, and reset without delay. *Auriculas*—May now be placed where they are to winter. If protected by frames, they should have bricks placed at each corner, raising them from the ground, to allow, at all times, a free circulation of air amongst the pots. If the frames are of brickwork, sliding-doors must be made in the sides for the same purpose. An Alpine plant, like the Auricula, detests damp and confined situations. *Pansies.*—Though these flowers, when properly managed, are seldom affected by cold, still beds of choice sorts, intended for next year's blooming, will be better for having hoops stretched over them, on which mats may be thrown, either in very wet or severe weather. *Carnations.*—There has

been a great demand for these favourite flowers this autumn, and in the north of England, where Rose-edged Picotees have not been exhibited, great quantities have been required; as, at most of the principal exhibitions, prizes will now be awarded for them. Refer to the past few weeks for the necessary directions as to potting layers, &c. &c., taking care that when the layers are again struck, or have emitted fresh roots, that they have all the air and sun possible; watering occasionally, but not over the foliage; and at all times keeping a vigilant eye over the stock, removing every spotted or decayed leaf as soon as discovered.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Much caution is necessary from this time, to prevent the atmosphere of the pits containing the succession plants from becoming too humid. Syringing should be discontinued, except on fine days, when the sun has power to raise the temperature several degrees. Whenever it is necessary to use the syringe during the winter, it should be done in the early part of the day. Pits heated by means of dung will require covering with mats at night. When covered, let every other light be slightly raised, to allow the steam to pass off. When the covering is off, it will escape through the laps of the glass. Take all opportunities of giving a little air. If it can be done every day, so much the better for the health of the plants.

Vineries.—If the Vines in pots are plunged in warm leaves or dung at about 80°, and the atmosphere kept at a temperature of 50° or 55°, the roots will be kept in advance of the tops, and the buds will break stronger in consequence. Let them be syringed frequently. Pay attention to the late Grapes, and let all decaying berries be immediately cut out. The slight fires made during the day to dry the atmosphere will leave sufficient warmth to prevent injury from frost at night.

Peach-house.—The Peaches in pots intended for the first crop should be either put into the house where they are to be forced, and kept cool for a time, or else placed in an open shed, as it is not good to commence forcing when the soil is drenched with moisture. If worms are in the pots they may be ejected by means of lime-water. No time should be lost in attending to this, if ripe fruit is required by the middle of April.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Planting.—At the risk of being charged with repetition, I cannot avoid urging the importance of early autumn planting. If put off till December, scarcely any advantage is gained over planting in March or April; but a great disadvantage will be experienced, if severe weather should set in immediately afterwards. If the leaves are still somewhat greenish, the check given by raising the plants will have a tendency to accelerate the ripening of the wood, and if after watering, the bark of the young shoots should present any appearance of shrivelling, the stem of the trees may be twisted round, with hay or straw bands, and a slight shading given to the top for a few days with fronds of Fern, &c. The straw bands should be twisted hard, so as not to retain much moisture; and for tender trees, they will be as serviceable in moderating the rays of the sun in summer, as in checking the severity of frost in winter. If, in addition, the roots are well mulched with dry litter, they will continue to grow all the winter, and thus be well fitted to supply the expanding buds in spring. In many gardens, an extinction of many of the old trees should be gradually effected. I say gradually, because frequently gardeners ardent after novelty, get themselves into scrapes, by clearing away too much at a time, and thus rendering the supply deficient until their young trees come into bearing. In planting, care should be taken to select the most approved varieties. It would take too much space to particularise these in this place. The improved varieties of Pears should be introduced into every garden, either by planting, or by grafting on established trees. In addition to their other good qualities, most of them are great bearers, and produce fruit when the trees are comparatively young. Such sorts as Marie Louise, Dunmore, Louise Bonne (of Jersey), Duchesse d'Angoulême, Althorp Crassane, Glout Morceau, Knight's Monarch, Passe Colmar, and Ne plus Meuris, &c., will supply the table with delicious fruit from September to the end of February, and in places at all favourable, will succeed admirably as standards, the fruit in general being as well flavoured, though not so large as that grown against walls. The Easter Beurré, and Beurré Rance, will furnish a supply until May, and even later if the fruit is well preserved in jars. Both sorts will thrive in most places as standards, but well deserve an east or west wall. No Pears need be grown in favourable places on a south wall, with the exception, perhaps, of a Jargonelle, to supply early fruit. This, along with the Citron des Carmes, and one or two more varieties, will be quite sufficient for an early supply.

Radishes.—A last sowing may be made on a south warm border, and they will be useful if the weather continue mild. A sowing may also be made on a slight hot-bed, to be defended with a frame, hooped mats, or straw-covers; the same thing may be done with Carrots and Onions, where very young ones are constantly in demand. *Cauliflower.*—The glasses should now be put over the plants intended for the first crop next season, but the tops of the glasses should remain off in all favourable weather. There is more danger of having them coming too forward, and producing mere buttons, than in having them too late. It is better to forward them in spring, than to encourage them to grow much now.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Continue to improve these in appearance as well as in value as much as possible, by removing all unsightly trees, and replacing them with others of more value. Lay open to view any particularly handsome trees, as recommended in late Calendars.

Coppice.—Proceed with all necessary works in this department; extirpate all valueless stuff, and replant the spaces with more profitable kinds of trees.

Young Plantations.—Embrace every fine day for forwarding all planting intended to be done before spring. This is much the best time for the general planting of evergreen trees, as in spring they are subjected to cutting, dry, frosty winds, alternately with a powerful sun. In sheltered, warm situations, and with great care, spring planting will, however, succeed.

Hedge-rows.—Continue to plant young trees, and make good any failures.

Nursery Work.—Take up and sort the young trees for planting out where required. Dig and trench vacant ground for replanting and sowing of seeds; put in some kinds now, and others in spring. Let the ground be got ready for them as soon as it is cleared of other crops.—*W. B.*

VII.—COTTAGERS' GARDENS.

As it is frequently the case that a very slight protection will save Dahlias and other favourite flowers until the middle, or even the end of November, such of the cottagers as have time and means might use some light canvas, or other slight covering, to throw over any plant particularly gay: with this several degrees of frost will be harmless. Where frost has taken effect, Lobelias, Salvia patens, and such plants, had better be got up, especially if the flower stems are killed as well as the leaves. The Salvias, in particular, ought to be left in the ground until the stems die down, as the tubers will be thereby much benefited. The best way of keeping these plants is to pot them in pots merely sufficient to hold the roots, using rather dry soil, and set them where they will be dry and cool. A few degrees of frost will be less hurtful than heat; they must get no water until they commence growing. Scarlet and other Pelargoniums for turning out in spring, ought to receive the same treatment; only they cannot be too soon taken up after their beauty is once destroyed by frost. In some cases, where the scarlet or other Pelargoniums planted out in beds are yet fresh, and have formed flower buds, the cottager might, by careful removal, obtain a few good plants for flowering in the window. Rather large pots should be used, and the plants got up with as little disturbance to the roots as possible; if they can be placed in a little close heat for a fortnight they will recover with the loss of only a few leaves. Asparagus beds, where the leaves and stems are brown, had better be cleared, and covered with an inch or two of dung. The refuse will be useful for putting round frames to keep out frost. If it can be applied dry so much the better, as it will be less liable to heat and rot. Next week I shall name a few varieties of Apples, Pears, &c., suitable for a cottage garden. —*J. McH.*

State of the Weather near London for the week ending Oct. 24, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

Apple-trees.—*A Young Orchardist.*—Perhaps you have planted varieties very subject to canker.‖

Bees.—*J. Argo.*—We have given so much information about Bees in the early part of this year, that we must refer you to former Numbers for the information you search for. If that is not sufficient for the purpose, you had better study some treatise on Bee management, such as Bevan "On the Honey Bee."‡

Bignonia grandiflora.—*H. L.*—Cut this back early in spring to within two or three eyes of the previous year's wood; and as it seldom flowers before the end of October or November, and then the flowers generally get injured by early autumn frosts, and fall off before they expand, and as the plant is also very late before it commences growing in spring, you had better encourage its early growth at that season, by placing some frame-lights over it, and mat the ends up close so as to form a kind of house over the plant; the covering may be removed about midsummer, but must again be put on before the cold nights, or first autumn frosts occur.¶

Books.—*Leyton.*—We have no book on the Botany of the Himalayas, except Royle's Illustrations, in 4to, with many plates. That work is indispensable to botanists in the north of India.——*Z.*—The small edition of "English Botany" contains figures of all our wild flowering plants. There are no plates to Sir W. Hooker's Works, except those which are published with them.——*J. Steed.*—Mackintosh's "Practical Gardener."——*S.*—Petzholdt's "Lectures to Farmers on Agricultural Chemistry."

Charcoal.—*A. Z.*—Soft-wooded plants make the best charcoal. Pile the branches neatly in a large heap; cover it over with sods, leaving a hole at the top, and another at the bottom; light it at the latter, and when fairly in a blaze stop the two holes, and watch the heap to see that no flames burst through the sides.

Hyacinths.—*A Cockney.*—Read what we wrote a few weeks ago about Hyacinths in glasses: keep them in the dark in a warm place till roots appear; a few grains of salt or guano sprinkled in the water can do no harm.

Injury by Goats Trespassing.—*A Subscriber.*—You may distrain the goats doing damage on your premises, and impound them. It is very doubtful whether, under the Malicious Injuries Act (7 & 8 George IV., c. 30, s. 24), magistrates can convict a person who, even after notice, merely *suffers* his cattle to wander into the grounds of another and do injury there. Magistrates, however, constantly assume jurisdiction, and convict where a person actually *turns or drives* his cattle into his neighbour's land, and they do damage there. You had better, at all events, apply to the magistrates who sit for your district, and request them to act in the matter.—*W.*

Insects.—*J. B. W.*—The active insects on the Ixora are the pupæ and imago of a Psocus, and not the males of the Coccus, which you will see represented in Curtis's Brit. Ent., pl. 717.*R*——*J. C. M.*—Your Palmer-worm is the larva of Agrotis exclamationis.*R.*——*R. W.*—Thanks for the flies. As I expected, a vast number of them are a species of Chlorops, and may be one of those whose larvæ have done considerable injury to the Corn crops this summer.*R.*

Melons.—*A Young Reader.*—The Melons to which you refer, (p. 688) are suspended from the wires to which the Vines are tied. The house is of the common form, with a lean-to roof, having a pit 2½ feet wide running along the centre; this is heated below by means of a hot-water tank, over which the Melons are planted. There is no crop in the house, as the Vines were only planted this season; the foliage, however, extends over as much space as if the Vines were in bearing. If a "Young Reader" wishes to try the plan, let him in the beginning of next July plant out some Melons in a vinery containing a late crop of Grapes. He will find that they will go on well together, as by the time the Grapes are beginning to ripen, the Melons will have done swelling; and then the dry warm atmosphere which must be kept up to ripen the Grapes, is just what is required for the Melons. *G. F.*

Morphology.—*A Constant Reader.*—You should use your eyes, and then you would find that the Purslane had flowers, although very small ones; no perfect plants can seed without flowering first. The seed had, no doubt, been mixed in the seed-shop where you bought it—a common trick.

Names of Fruit.—Our correspondents are entreated to observe that much space and time would be saved if those who send fruit for names would forward along with them a list containing the numbers and such names as they may have for their varieties. In many instances these would probably only require a little correction.——*S. W. G.*—1, Aston Town; 2, White Doyenné; 3, Moorfowl Egg; 4, Golden Reinette.‖——*R. Tatham.*—No. 1, which you had for the Beurré Spence, is the Brown Beurré, and for the Winter Rousselet, No. 2, you have got the Bishop's Thumb. The small ovate pale-yellow sweet Apple, called the Small Stolk, is not known by any other name.‖——*W. S. J.*—1, Norfolk Beaufin; 2, Bedfordshire Foundling; 3, Kirke's Golden Pippin; 4, Winter Nelis; 5, Beurré de Capiaumont.‖——*W. H.*—Blenheim Pippin.‖——*F. Darby.*—Not the Colmar, but St. Germain: the other is the White Doyenné. Specimens of both varieties unusually large, doubtless, as you observe, in consequence of having your fruits excessively thinned.‖——*St. M. H.*—3, 4, Lamb Abbey Pearmain; 5, Keswick Codlin; 7, Kirke's Golden Pippin; 8, probably Black Annett; 9, Blenheim Pippin; 10, Yorkshire Greening; 11, Large Hunthouse; 12, Hollandbury; 13, Court of Wick.——*A Constant Reader.*—1, Winter Bon Chrétien; 2, Brown Beurré; 3, Passe Colmar; 4, Bishop's Thumb; 6, Uvedale's St. Germain; 7, Marie Louise; 8, Winter Nelis.‖——*H. Y.*—1, Beauty of Kent; 2, Hollandbury; 3, Northern Greening; 4, Gansel's Bergamot.——*Thomas Croad.*—Flemish Beauty.——*A Subscriber.*—Blenheim Pippin.‖——*T. Barnes.*—Uvedale's St. Germain.——*Rhodon.*—Beurré Diel.‖——*Russet.*—Your Apple appears to be Loan's Pearmain, in good perfection.‖——*A Constant Reader.*—1, Minchall Crab; 3, Nonsuch.‖——*S. H.*—Nailing the tickets upon your fruit with iron tacks, is not so secure as might be supposed. The acid juice partially dissolves the iron, exudes and obliterates the numbers, or the nail loosens as the surrounding tissue wastes, and drops out. Of those you sent there were found attached—2, Winter Pearmain; 3, Blenheim Pippin; 8, Downton; 11, Posse Colmar. Some well-coloured Fearn's Pippin and Golden Reinettes were observed.‖——*Mrs. W.*—The Seedling Apple is handsome and sugary; but although good it will not bear comparison with the Golden Reinette, which becomes fit for use at the same time.‖——*J. D.*—1, an exceedingly handsome, large, finely-coloured Apple, not known; it deserves particular notice; 3, Hughes's Golden Pippin; 4, Cockle Pippin; 6, Bedfordshire Foundling; 9, Verte Longue; 10, Coe's Fine late red Plum.‖

Names of Plants.—*C. D.*—As far as we can judge from flowers jammed to pieces among cotton wool, your plant is Oncidium trulliferum; but it *may* be new. We never saw the fruit of Stephanotus; no doubt it is poisonous.

Peach-trees.—*Querist.*—These may be partially pruned as early as October. At Montreuil, such bearing shoots as are not required for the extension of the tree are cut out as soon as the fruit is gathered.‖

Pears.—*Querist.*—There can be no advantage in raising Pear-trees from cuttings; on the contrary, the wood of cultivated varieties is not so perfect as that of the wild species; consequently, it is not so well adapted for enduring vicissitudes. The varieties of Pears you enumerate, Marie Louise, Napoleon, Beurré Diel, and Gansel's Bergamot, should not be gathered until they readily part from the spur.——*H. W. B.*—The Pear you sent possesses all the excellence you ascribe to it, and will be specially noticed as soon as possible.

Pear-trees.—*W. S. I.*—The spots on the leaves are occasioned by the Pear-tree Blister Moth, on which you will find an excellent article, with a figure and description, by Mr. Curtis, vol. i. p. 260. Sweep up and burn every leaf, carefully remove the surface soil from around the tree, and substitute fresh. With regard to your list of Pears, you will probably find the Beurré Spence to be the same as some of the other varieties you enumerate, all of which are good.‖

Spruce-beer.—Will any of our correspondents have the goodness to inform *J. C.* how this wholesome beverage is best made? Is Dantzic Spruce the same?

Stove Plants.—*Aliquis.*—Musa Cavendishii, Mangoes, and Guavas offer you the best chance of ripening tropical fruits. You may procure them of, or through, any of the great London Nurserymen. Among gay stove plants, take Euphorbia jacquiniflora, all the Achimenes, Poinsettia pulcherrima, Bignonia venusta, Passiflora Loudoni and quadrangularis (a fruit), Ixoras, Thunbergias, and Oncidium Lanceanum.

Strawberries.—*M. A.*—Small round stones will not keep air from the roots; it will find its way freely through their interstices. We recommend them in preference to tiles, when they can be had—1st, because they cost nothing; and 2d, because they look very neatly.

Vine-borders.—*Rusticus.*—The main bulk of the compost for a Vine border should consist of rich turf; to which may be added bone-dust and cow-dung. You may plant a Vine for each sash, and allow three cubic yards of compost for each plant; this will admit of the border being ten feet wide; or, with 48 cubic feet, you may form it only 6 feet wide in the first instance, and add 6 feet more as the Vine-roots extend, which will prove advantageous. Paving, or any other covering which would prevent the access of rain to the roots in summer, is objectionable. If you have strong and weak growing sorts, and can afford separate beds for each, so much the better. The rod system of pruning is best for large bunches, and for some varieties; close spurring for producing on the Black Hamburgh, and some others, a heavier crop consisting of a greater number of smaller bunches.‖

Wistaria sinensis.—*A Subscriber.*—Prune this about the beginning of March; cut the leading shoots about half way back, and spur the others in rather short.¶

Miscellaneous.—*S. B.* 369.—We regret to say that there is no sort of demand for your talents; the field is a very small one, and is already fully occupied. Teaching is the only mode of turning such talent to profitable account.——*A. M.*—The best season to plant Belladonna Lilies is the beginning of August.——*Querist.*—Cut the strong shoots of your China Roses about half way down. Stop and cut back the long shoots of Climbing Roses, if not wanted to cover a large space quickly. Spruce Firs make an excellent hedge for shelter.¶——*A Lady.*—Your dark closet is too cold for the Hyacinth roots to show themselves quickly. Can you not wrap the glasses in some old baize, or place them where they get a little artificial warmth; that is essential. Water your turf with lime-water, prepared by steeping fresh lime in water for 24 hours, and draining off the clear fluid. A peck of lime is enough for a hogshead of water.——*A. M. S.*—Your plant of Oleander has probably been allowed to get dirty, which is the cause of white scale forming on it.¶——*A. Z.*—The leaves of Pinus Pseudo-strobus sent are by no means uncommon; most of the strong-growing kinds, if they happen to lose the leading point of the young shoot during the growing season (which is frequently caused by the Pine-beetle), will lose the power of elongating, and consequently to form those monstrous leaves, especially if the plants are young and vigorous.¶——*A Young Beginner.*—Buphane ciliaris, Trichonema speciosum, and Cyrtanthus odorus are greenhouse bulbs; Griffinia hyacinthina is a stove bulb. You had better not start them till February.§——*H. D.*—Ipomœa Learii is a perennial. Your plant on the back of your conservatory is perhaps too far from the glass, or shaded by other plants. Train it to a rafter where it will be within a foot of the glass, and it will flower freely.§——*R. J. W.*—We do not know to whom the Pansy belongs noticed under the initials *Z. A.**——*W. B.*—You can hardly hope to save your Cape plants without better means than you possess. Nevertheless it may be worth trying whether they will not survive where they are by having six inches of sand (sea sand will do) placed well over the roots, and some Spruce branches tucked in among their shoots.

SEEDLING FLOWERS.

Fuchsias.—*G. S.*—Your seedling *Junius* appears to much greater advantage on the plant, the foliage of which is handsome, and the habit of the plant good; the flower is stout and handsome, but we are still of opinion it carries too much colour in the tube and sepals for the vermilion corolla.*

Pansies.—*W. M.*—The Pansy sent is a good specimen of form, but it wants substance, and is common in colour.*

Verbenas.—*A Constant Reader.*—Your specimen is a good variety: it is not novel in colour, but the size of the light centre makes it attractive.*——*W. W. W.*—Your seedling is a large and handsome variety of a bright rose colour.*——*G. S.*—Your specimen is large, and carries a fine head of bloom, but it appears to want novelty of colour.*

DR. HALLETT'S DRY SOLUBLE FERTILIZER'S are, considering their power, the cheapest Manures in use, for they are entirely composed of the Phosphates and other Salts of Ammonia, and other acknowledged powerful fertilizers. They are fairly before the Public as tried things (see No. 33 of the *Gardeners' Chronicle*, &c.). 5 cwt. of either has been found equal to nearly 30 tons of ordinary horse-manure. They are applicable to all sorts of field and garden crops. No. 1 for heavy top growth, as Corn, Hops, &c. No. 2 is for all roots, and a sure preventive of the Fly in Turnips. Price of each, 10*l.* per ton, or 12*s.* per cwt.

DR. HALLETT'S CONCENTRATED LIQUID FERTILIZER is extensively used by Gardeners for improving the size and flavour of fruits and vegetables, and the colours, and perfecting the seed of flowers. Sold in quarts at 1*s.* 6*d.*, and in bottles, six times the size, at 7*s.* 6*d.* Each quart requires 32 gallons of water, to reduce it for use.

Agents for the above. London—Mr. Fothergill, Thames-street; Mr. G. Hallett, the Factory, Broadwall, Blackfriars; Messrs. Warner & Warner, 28, Cornhill; Hurst & M'Mullen, 6, Leadenhall-street; Winstanly, Poultry; Pace & Co., St. Peter's Alley. Norfolk—Bullard and Watts, Norwich. Suffolk—Mr. W. Revans, Yoxford. Leicester—Mott and Co. Gloucestershire—Mr. Betterton, Fairford. Devonshire—Mr. Seward, Plymouth. Wilts—Mr. G. King, Devizes. Glasgow—Mr. D. T. Jackson, Hartlepool. Sunderland, Stockton, and Newcastle—Pace & Co. Dundee—Green and Co. Further respectable Agents wanted.

The Agricultural Gazette.

SATURDAY, OCTOBER 26, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Oct. 31—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, Nov. 6—Agricultural Society of England.
THURSDAY, Nov. 7—Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

Oct. 28 - Chepstow, Wickham Market, Yoxford.

IN a former Number we called attention to the numerous crops of Barley which are yet in the field, and endeavoured to point out how such a circumstance might have been prevented. Whatever effect our advice and the experience of the season may have on our management for the future, our present duty is unquestionably to make the best we can of a bad bargain, and to contend to the utmost of our means with the disadvantages which are before us, from whatever cause they may have resulted.

One of these disadvantages—THE DIFFICULTY OF SECURING THE CROP—is now felt pretty generally. The state of the crop, owing to its mixture of ripe and half-ripe straw, is such that it requires much more than ordinary fine weather; and, in the second place, the season is so far advanced that instead of a continuation of the fine warm weather necessary to enable us to secure the crop quickly, we have frequent showers, heavy fogs, and short days. To expose our crop for so long a period with a certainty of fickle, and a *probability* of stormy weather before us, is a matter of such imminent risk that it becomes a question of duty with all who are thus situated to ask, Is there no method of avoiding it?

In our opinion, the following method, which has been often successfully employed, in securing grain in difficult and adverse seasons, will be found capable of diminishing in a very great degree the risk alluded to, and will enable us to harvest our backward crops without the delay and danger of more than a day or two's *fielding*.

Take the first opportunity after the grain is cut, when the straw is dry—*i. e.* free from rain or extraneous moisture—to secure the crop in the following manner:—Place four sheep bars or hurdles in two parallel lines, leaving a space of about 24 inches wide between the rows. This will form a double fence about 6 yards in length. Upon each side of the double fence spread a bottom of thorns, and upon this, place a course of sheaves *with the heads towards* the sheep bars. After a few courses of sheaves have been laid in this manner put an occasional one with the sheaves longitudinally. Continue to build up the wall of sheaves on each side of the bars until you have got 2 feet above the bars; after which lay a course over the passage between the bars, and roof up both sides to the centre. Cover the roof with old thatch or loose straw, and bind it well down. This may be done without treading on the rick, as the more lightly the sheaves lie, the better the work is.

This being done, we have a rick, through the middle of which there is a passage or flue 5 feet deep by 2 feet wide, and as the heads of the sheaves are generally towards the passage, the air has free access to the grain—in fact, there is a continual current of air passing through every part of the rick; for as the sides of the rick are only one course of sheaves in thickness, there is a multitude of flues leading into the main passage, through the whole of which there is a continual draught; by which arrangement the grain gets all the benefit of exposure to the atmosphere, without any of its risks.

The rick which we have now described—two bars in length—will hold the produce of half an acre of land, and when properly built will harden and weather it nearly as soon as if it were in shock. By prolonging the double row of bars a rick of any size may be formed. We should advise, however, that every half acre should be put in separate lengths, *i. e.*, that communication with the other ricks should be broken off by a passage 2 or 3 feet wide, at the end of every alternate bar; this passage, running at right angles with the longitudinal one, would materially increase the circulation of air. The following is a ground sketch of the rick containing the produce of an acre:—

Any number of these ricks, it will be seen, may easily be made, and the air will have equal access to every part; so that in the course of a month or five weeks the grain which has been so secured, *however raw it may have been*, will come out fit for the stack-yard or the barn.

If we claim any merit for this method of securing grain in an adverse season, it is on the score of utility, not of originality. On the contrary, one of its chief recommendations is, that it has in several cases been employed with perfect success, and that there are several modifications of the same principle in common use. Among these we may name the frame-work chimney, which is so generally used in all stacks in Scotland, and that which is used in hay-stacks in England. Perhaps, however, the most original and simple illustration of the principle by which we now propose to secure grain in difficult times, is that of setting *the stack astride of a Quick-thorn hedge;* a practice which has long been honoured by the approbation of our grandsires, and which derives its utility from its admitting a current of air into the stack.—*H.*

PARHELIA, &c.,

Seen by E. J. LOWE, on 20th and 21st October, 1844.

ON the days above stated I noticed very rare and interesting atmospheric phenomena, on which the following are my remarks. For two or three days prior to the 20th the weather had been showery with slight frosts at night. 20th—barometer, max. 29.351, min. 29.248; thermometer, max. 53°, min 40°; wind, S.W.; mean amount of cloud, $6\frac{8}{10}$; few cumuli; fine sunshine A.M.; nimbus and cirrostrati, dull, with few drops of rain at 5 P.M. At 8h. 30m. P.M. a brilliant halo of 45° encircled the moon; at 8h. 40m. a mock moon, of a pale silvery hue, shone out of the halo on the E. side, and on the horizontal level of the moon; this continued visible till 8h. 50m. P.M.; the lunar halo remained all night. 8h. 30m., noticed a very brilliant and beautiful display of Aurora Borealis: a broad stream of flame extended from the N.E. horizon, through the constellations Auriga, Capella, Perseus, Cassiopeia, Cygnus, Lyra, and disappeared in the horizon in W., near Serpentarius; this band flickered brightly for 15 minutes, when it vanished. 8h. 40m.—a flame crossed (through the broad flame) from the Polar star through Perseus. 8h. 45m.—another stream of light extended through Ursa major, Ursa minor, to Draco: at this time the flame from the Polar star to Perseus was very vivid. During the whole of this display the horizon from N.E. round by N. to N.W. appeared as one continual flame, not glaring upwards, but along the horizon; therefore the chief portion of the light was reflected from below. At 9 o'clock the Aurora Borealis vanished, excepting a slight glimmering now and then, which would scarcely have been perceived had not the phenomenon been noticed before. At 11 P.M. the stars shone through a haze, which gave them the appearance of being surrounded by burrs.

Oct. 21.—Few cumuli and cirri; fine sunshine A.M., dull P.M.; rainy night; barometer, max. 29.572, min. 29 241; thermometer, max. 55°, min. 39°; wind, S.E.; mean force of wind, 2; mean amount of cloud, 7; thermometer at 9 A.M., 47°; hygrom., $42\frac{1}{2}^{0}$; therm. 9 P.M., $46\frac{1}{2}^{0}$; hygrom., 40°; barometer rising.

At 11 o'clock A.M. a highly prismatic halo, C C, of 45° in diameter, surrounded the sun; the clouds around were thin linear cirri, those on the horizon cumuli.

View of the Phenomenon at 2h. 10m. P.M., with the addition of the Parhelia.

11h. 30m.—An inverted arc of a rainbow, D D, resting on the summit of the halo C C appeared. At the point E, where this rainbow cut the halo, it was almost as brilliant as the sun itself. This lasted till 0h. 15m. P.M., when it vanished, together with the halo.

1h. 15m.—The halo C C and inverted arc of rainbow D D again appeared; the latter was very distinctly prismatic, having the red colour next the sun. From this time until a little after 2 o'clock no change worthy of mention, excepting that the inverted rainbow kept increasing and decreasing in brightness, and every now and then so brilliant that you could scarcely look at it.

2h. 1m.—A Parhelion, A A, of a silvery colour, appeared in the S.E. side of the halo C C, and on the horizontal level of the sun.

2h. 5m.—Mock sun vanished; the portion E of inverted rainbow D D was extremely bright.

2h. 9m.—A halo, or, more properly speaking, a rainbow, F F, became visible, surrounding the upper or N.E. half of the halo C C, at a distance of 15° from it; this was of a silvery hue.

2h. 10m.—Another inverted arc of a rainbow, G G, appeared at the vertex of the rainbow F F. The inverted rainbow D D was brilliant in the highest degree. Both the inverted rainbows, D D and G G, were situated and opened in a direction to the N.E.

2h. 15m.—Atmosphere very dense. Inverted arc of rainbow G G, and rainbow F F, and S.E. side of the halo C C, disappeared. Inverted rainbow D D very brilliant. Few cirrostrati below the sun, and cumuli round the horizon.

2h. 18m.—Halo C C very indistinct. Inverted rainbow D D still very bright.

2h. 26m.—Inverted rainbow D D vanished. A faint parhelion B B was visible in halo C C, on the N.W. side, and on the horizontal level of the sun; this lasted till 2h. 30m., when all vanished. Scud and cirrostrati covered the whole visible surface of the sky, and became more dense every minute. The clouds were evidently formed on the spot, and plainly by the vapours reaching the cold current. Overcast, close evening; rainy night.

Excepting the halo C C and inverted rainbow D D, which were prismatic, the colour was pale silver throughout.

A very similar phenomenon to the one seen to-day was noticed by Hevelius at Dantzic on 30th March, 1660, only this was parhelia, and that described by the Polish astronomer paraselenæ.—*E. J. Lowe, Highfield House, Lenton, Nottinghamshire.*

GEO-AGRICULTURAL NOTES ON SOUTH GLOUCESTERSHIRE.

(*Continued from page* 691.)

Mountain Limestone.—This rock occupies a considerable portion of our district. It occurs in a tract of a horse-shoe form, and of considerable breadth, underlying the millstone grit, and overlying the strata of the old red series from Sodbury by Wickwar, Cromhall, and Alveston, as far as Almondsbury. On going southwards from Almondsbury we pass over a district of lias clay, which here appears to overlie the limestone, for, immediately beyond Henbury, we again come upon that rock, forming the range of hills which extend towards the Avon beyond Kingsweston. From this spot it widens out between Westbury and Filton, in a southerly direction. A considerable tract of this rock is exposed south of Bristol, comprising Clifton and Durdam Downs, &c. The rock here is much intersected by wide veins of calcareous spar, which is quarried and broken down to a fine gravel and used for rough-casting buildings. The mountain limestone, more than any other rock in the district, seems to have suffered violence. The fault on Alveston Down, that at Doynton, the extensive ravine at Clifton through which the Avon flows, a similar one between Wick and Doynton, through which the Boyd runs, another at Tortworth Park, and a fourth in the grounds of Blaize Castle, Henbury, all occur in this rock. They are productive of the finest and most picturesque views in the county. The mountain limestone does not form a good building stone, being too splintery for the mason's chisel. It forms an excellent road material, however. The only rock, indeed, which can compete with it in the district for that purpose, is the trap rock of Damory, near Tortworth, but this, though perhaps a tougher and more durable material, does not form nearly so smooth or so excellent a road. This rock is also the best source of lime for building and other purposes in the county; it burns, when pure, as at Cromhall, of a perfectly white colour.

Agricultural Character of the Mountain Limestone.—The surface of this district, with the exception of instances just alluded to, is uniform and regular. It has frequently a bare and bleak aspect, because of the want of hedgerow trees, and because of the frequent occurrence of downs and commons. The general level of the district, too, is higher than that of the surrounding country, and it is thus more exposed to the weather. The Beech and the Ash are the trees of most frequent occurrence on it; the Elm is also occasionally seen. The commons are dry, the pasture on them close but sweet. This district is about one-half under arable culture. The pasture-land is easily burnt; there cannot be too wet a season for the soil where it is shallow. An average crop of about 18 cwts. of hay per acre is cut. The soil on the arable land is full of angular fragments of the rock, and is generally very thin. It is, however, a good calcareous loam when of any depth, and its natural lightness, increased by the numberless fragments of stone occurring in it, renders it an excellent Barley soil. The rotation adopted is one of four years' duration, the same as that adopted on the millstone grit in the neighbourhood; 1st year Wheat, 2d Barley, 3d Seeds, 4th Potatoes. Turnips are sometimes grown instead of seeds, and frequently that crop is omitted altogether. In that case it would be difficult to find a more exhausting succession of crops. Everything is carried off the land, and very little return is made to it. The grain is taken to

Bristol, the straw, sold as litter, or thatch, is taken there too, and the Potatoes also supply the Bristol market. The loads of dung which are brought back in the waggons on their return from Bristol can form no equal return for the crops thus carried away. The average crop of Wheat per acre is about 20 bushels; of Barley 32, and of Potatoes 60 sacks. Eight tons of the latter crop is considered an excellent crop; it is equal to about 80 sacks.

The soil on this rock is sometimes limed by some: this is said to do good; and by others it is said to be of no use at all. It is a general practice on those farms which lie over the clay and slate alternating with this rock near Itchington and Tytherington; the soil is there of a cold clayey nature. The district of this rock between Elberton and Lyttleton differs from that on the hill in being more sheltered; it is covered with the Elm and the Ash in the hedgerow; the soil is also generally deeper, and the land more generally in pasture. With these exceptions it is similar to the rest of the formation.—*M. S.*

ON LIMING LAND.

[The following analyses, for the Monmouth Farmers' Club, by Mr. Phillips, of the Ordnance Geological Survey, show what great variety exists in the composition of limestones within but few miles of one another.]

No. 1.—Limestone, Great Doward, Herefordshire.

Carbonate of lime	56.8
,, ,, magnesia	39.2
Earthy matter and oxide of iron	4.
	100

No. 2.—Limestone, Stanton, Gloucestershire.

Carbonate of lime, with a trace of oxide of iron	54 6
,, ,, magnesia	44.
Earthy matter and oxide of iron	1.4

No. 5.—Limestone, Ifton, Monmouthshire.

Carbonate of lime	99.3
Earthy matter and oxide of iron	7
	100

Result of the use of the Stow Green Lime put on in a caustic state in September and October upon the dry sandy meadows along the bank of the Wye (except No. 5) extending about two miles from Whitebrook to the village of Landogo, Monmouthshire, No. 1 being near Whitebrook, and No. 6 adjoining the churchyard at Landogo. Nos. 1, 2, and 3 were covered with rotten dung at the rate of 20 yards per acre between the years 1830 and 1834; the other meadows have not had any manure in the memory of man. The average produce of hay from these meadows when cut in season (without manure) for the last 20 years has been only from 10 cwt. to 14 cwt. per acre. A part of each meadow was left without lime, that a fair trial might be made, and the whole of the trials (except No. 6) were taken within three yards of each other; indeed many of the trials were within a foot; the line where the lime was put being so strongly marked that a perfect stranger might tell which part was limed and which part not. The best plan is to put the lime in heaps of one or two waggon-loads, covering the heaps with a thick coat of earth till it is slaked, and then to haul or wheel it out in a caustic state, spreading it out of the cart or barrow. If the place where the loads are put down is shovelled out clean, there will in those places be the strongest crop of Grass the following summer. Stow Green is within three miles of these meadows, and the price of the lime being 4*s.* 6*d.* per dozen, or 1½*d.* per bushel, the cost of manuring at the rate of 108 bushels amounts to 27*s.* per acre.

No. of Meadow.	The Autumn when Limed.	Imperial bshls. of Lime put on per impl. acre.	What year mown after being Limed.	Quantity of hay on the limed part per acre more than on the part not limed.	REMARKS.
				Cwt.	
1	1842	108	1st	4¾	From this trial it appears the more lime used the more Grass.
		144	do.	10¼	
		216	do.	18½	
2	1835	126	3d	20½	The limed part of this meadow may now be traced by a stranger.
			4th	14¼	
			7th	6½	
3	1838	108	2d	10½	
			3d	20¼	
			5th	11	
4	1838	108	1st	4¾	
5	1835	126	3d	22	This piece has a barn in it, and adjoins the turnpike-road, near the village of Landogo; although the part limed has had no manure since (now eight years) a stranger may at once see the great difference between this and the part not limed; the limed part being very superior in herbage and produce. In fact, as long as there is a blade of Grass upon the limed part the stock will not touch the other.
6	1840	108	3d	20¼	

The lower part of No. 3 was this autumn (for the first time) dressed with lime from Stow Green, varying from 108 bushels up to 360 bushels per acre, and with lime from Whiteclift at the rate of 72 bushels per acre, in quarters of an acre adjoining, with a strip in the centre without anything put on. From a trial made this autumn it appears that lime in these meadows sinks at the rate of about one inch per annum. It is a singular fact that the same quantity of lime per acre, mixed with 30 yards of ditch-earth and road-scrapings, put upon some of these meadows, has not produced so great a crop of hay as the same quantity of lime put on in a caustic state. A trial was made in one of these meadows with 20 cart-loads of unfermented, or raw horse-dung per acre against 20 yards of rotten dung. The result was decidedly in favour of the raw dung the first year; but the rotten dung had the advantage the second year, when the trace of both was nearly lost. A trial has been made in one meadow with scavengers' manure from Bristol, at the rate of 20 tons per acre, and although it was delivered upon the bank at 3*s.* per ton, the increase of hay did not pay half the cost.—*Communicated from the Report of the Monmouth Farmers' Club, by R. W. Purchas, Sec.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Oats.—The varieties of this grain commonly cultivated in East Lothian, are the Potato, Hopetoun, Early and Late Angus, Sandy Dun, and several others. The first-named kind, which was, it appears, introduced into this county in 1801, possesses the greatest reputation; and although it is not so well suited to inferior soils and elevated situations as some of the others, its grain is more plump, weighs heavier, obtains a better price in the market, and yields a greater weight of meal than any other variety grown in this quarter. Another very extensively cultivated kind is the Hopetoun Oat, selected and propagated by Mr. P. Shirreff, late tenant at Mungoswells, in this county. It affords a greater quantity of straw than the Potato Oat, but is later in ripening. The Early Angus is also much esteemed, and produces a large proportion of straw, which is an important consideration here. The preceding four varieties are those held in the greatest estimation, and most extensively cultivated in the low and fertile parts of the county. The Sandy Oat is also grown to a considerable extent. The Dun Oat was introduced from Fifeshire; it thrives better than most other kinds upon poor soils, ripens early, and yields a good proportion of meal. It is, as the name implies, of a dun and dirty gray colour, resembling in appearance the white kinds that have been injured by heating. Besides those enumerated above there are several other varieties of the Oat partially grown in different parts of the county, such as the Poland, Blainslie, Flemish, Zealand, &c. The following Table exhibits a comparative view of the result of an experiment made with four different kinds of Oats by Mr. Brodie, Abbeymains, as detailed in the nineteenth Report of the East Lothian Farming Society. The quantity per acre sometimes obtained in East Lothian will also be perceived from the annexed Tabular view of the result of Mr. Brodie's experiment. It will be observed that the Potato Oat produced 90½ bushels per Scotch acre; the Hopetoun, 88 bushels; the Flemish, 86 bushels; and the Zealand, 85½ bushels.

Names.	Acres.	Grain Bushels.	Weight, Imperial lbs.	Straw, lbs.	Per Scotch Acre. Bushels.	lbs.	Per Bushel, lbs.	Straw, lbs.
Hopetoun	1.97700	174	7344	11,005	88	3714	42 2	5566
Potato	1.88850	180	7927	9798	90½	3986	44	4927
Flemish	1.91309	165	7186	9800	86	3756	43.5	5122
Zealand	1.79850	154	6780	7824	85½	3761	44	4350

Oats are most generally sown after Grass, which has lain for one or two years, the land being ploughed the previous winter, or as early in spring as the state of the weather and the labour of the farm will admit, in order that it may receive some of the winter's frost, which materially facilitates the process of harrowing. This is especially the practice on strong clay lands. On the lighter and more friable class of soils, where the furrow-slices are liable to be too much levelled down by the influence of the weather, many farmers defer ploughing a part of the lea until about seed-time; the seed is then sown as soon as practicable after the land has been ploughed. Oats are sometimes, but not frequently, sown after summer fallow, but often succeed Turnips. Oats are also, under particular circumstances, taken after Oats; this, however, but rarely occurs, and may be considered a deviation from the general practice.

Oats are for the most part sown broadcast, either by the hand, or with the broadcast sowing-machine; but where there is a great prevalence of annual weeds, particularly of the Wild Mustard or Charlock (*Sinapis arvensis*), it is not uncommon to sow in rows with the drill-machine, which admits of the land being afterwards hand or horse-hoed, and the weeds destroyed. In this case, the surface is first well reduced by the action of the harrows, after which the seed is deposited in parallel rows across the ridges. A single turn with the harrows is then given, and the land water-furrowed.

The period of sowing Oats is usually from the beginning of March to the middle of April; but this, of course, is mainly regulated by the weather. In some seasons the sowing of the Oat crop is concluded by the end of March, whilst in others comparatively little is done till the month of April. The quantity of seed varies according to the quality of the land, variety of seed, and other circumstances, from 3½ to 4½ bushels of the Angus kind, and from 3 to 3½ bushels of Potato Oats per acre. The latter variety tillers better than the former, or indeed any other kind, which renders a small allowance of seed sufficient.

The produce obtained per acre varies very much with the seasons. In 1832, which was a very productive year in this county, many farms averaged upwards of 7 qrs. per acre. A field in one farm which was summer-fallowed and sown with late Angus Oats at the rate of 2½ bushels to the acre, yielded, as I have been told by the tenant, 13 qrs. per imperial acre. These are, however, altogether extraordinary crops; 6 qrs. are regarded as a good crop, but 45 bush. are reckoned to be a fair average produce per acre throughout the county. In the low and fertile parts, the average is generally greater, but in the upland districts it is considerably less. Angus Oats weigh generally about 43 lbs. a bushel, and Potato Oats from 44 to 46 lbs. A bushel of Potato Oats usually yields 3 pecks of meal of 8¾ lbs. each.—*T. Sullivan.*

ON THE ACTION OF GYPSUM.

The Number of the *Agricultural Gazette*, for Oct. 12, contains a communication from Prof. Henslow, qualifying the statement which it was asserted he had made respecting the fixation of ammonia by gypsum. No very strong recommendation of gypsum appears to have been given, and, in the absence of some expected returns, Prof. Henslow contents himself with directing the attention of practical men to this important agricultural experiment. The theory—for such at present, perhaps, it must be termed—will scarcely be looked upon as very plausible, since Sir J. Herschell says of it, "I never tried the experiment, and have even some small doubt of the fact that carbonate of ammonia in a liquid or vaporous state will decompose solid crystallised sulphate of lime, though I do not deny that it may."

In order to arrive at some practical conclusion on the subject, I placed about a tenth of a grain of gypsum and an equal quantity of carbonate of ammonia, with two or three drops of distilled water, on the stage of my microscope, and the result leads me to think that we may safely go even beyond any measure of praise which gypsum has hitherto received. A double decomposition of the two bodies was immediately effected. The sulphuric acid of the gypsum took up the ammonia, and after a few minutes prismatic crystals of sulphate of ammonia were abundantly formed, while the carbonic acid, liberated from the ammonia, formed minute crystals of carbonate of lime, which thickly clustered round the dissolving portion of carbonate of ammonia. Is it right to infer from this position of the crystals, which the microscope discovers, that ammonia has a greater affinity for sulphuric acid than carbonic acid has for lime? or, if the reverse were the case, should we not find the newly-formed crystals of carbonate of lime congregating round those of the sulphate? This state of things may be illustrated by the following diagram:—

Be this, however, as it may, it is clear that gypsum may be most successfully used for the fixation of ammonia. I have tried the experiment on a larger scale, by placing 100 grains of each of these compounds in 3 oz. of distilled water for about 30 hours, and on evaporating the filtered supernatent water to dryness, I obtained 67 grains of sulphate of ammonia. I find, also, that sheep-dung, incinerated, and then similarly treated with sulphate of lime, yields a soluble sulphate at the expense of the gypsum; and I therefore only add, that the result of these experiments has induced me to order three tons of gypsum for my glebe farm, though but a few days ago I refused to make a purchase, under the impression that the advertisements of dealers are, like American stories—remarkable if true.—*J. B. Reade, Stone, Aylesbury.*

Home Correspondence.

Scotch and English Farming.—I have seen several attacks on English Farming in the *Chronicle*. Will you permit a Scotchman who has been over the greater part of Scotland, and lived many years in the south of England, to make a few remarks relating to the subject? Your correspondent, Mr. Russell, says, if England were to be cultivated the "same as Scotland, the land is capable of yielding double the increase;" and he contrasts Sussex with the "high lands of Scotland." Now, to any one who has studied the soil and climate, with the art of cultivating the high lands of Scotland and south of England, the comparison is absurd; and I will venture to say, that if Sussex were cultivated the same as the "high lands of Scotland," instead of returning double the increase, its produce would be greatly diminished. The "Strathern Farmer" very fairly says that he does not pretend to know English farming thoroughly, or enter into its minute details; and we also learn from him that it was at railway speed he saw the defects for which he points out the remedy. He complains that "there is only one-third of the land in crop, if so much," meaning a Corn crop, as if a crop of Hay or Grass for beasts was of little value. True, there are few good meadows in Scotland, and their pasture is generally the most inferior land, but in the south of England it is the contrary;—meat is more in demand, and we can have Corn transported from Scotland or Ireland more conveniently than we can have meat or hay for the great metropolis. Good marsh lands in Kent and Sussex can be let at 3*l.* per acre, besides paying rates, tithe, and taxes, which may amount to 20*s.* more; and I would ask, Could such land be more profitably employed in growing Corn? There is, no doubt, a great deal in every district that might be improved, but there is also on the "Strathern Farmer's" route some excellent farming; and if farmers would look more to the best farmers in their own neighbourhood,

they would improve their own farms more than by adopting the customs of a distant county, [This is unquestionably true.] for a very great deal, I find by experience, depends on locality. Scotland in most seasons will grow the heaviest root-crops, while England will grow the best Wheat and Barley; Oats will generally, also, be found best in Scotland, because the climate is cooler and more moist; they are too thirsty for the dry lands in Surrey, and it is found better to buy Oats and grow Barley. As to Turnips, if we were to sow them as early as they do in Strathern, on our warm land, they would get rotten before winter; but then we have the advantage of growing a good crop of Turnips after Peas. As to broad hedge-rows and waste land much might be said, but I will only remark at present, that if there were more hedges on the "high lands" of Scotland, they would be found very useful for shelter; but the fact is, it is a hard matter to contend against a high climate, and because hedges grow but very slowly they build there stone dikes (walls) when they can afford it! I may also add that the probability is, while England retains her wealth and game laws, we shall have warrens near the metropolis paying better than Corn fields. I thought Scotchmen knew as well as anybody that the nearer court the more play! As to ploughs, I doubt whether the Scotch swing-ploughs be fit for all soils and situations; I once thought so, and had one direct from one of the best Perthshire makers, but found it not altogether unexceptionable on Weald clay. The implement described by your correspondent as a "large, clumsy, wooden article," certainly did its work better in certain states of the land. I might here remark that I do not think there is any land in Scotland so difficult to move as the district called the Weald of Kent and Sussex. Mr. Morton says, in his book on Soils, that "the peculiarity of this soil is the minuteness of its parts; the silicious matter being so very fine, and the clayey particles being equally minute, they form a close firm paste, which dries into a substance almost as hard as bricks." Small inclosures and deep ditches are almost essential to get the surface-water off this soil, and old meadows and high hedges are found in practice almost necessary in the cultivation of good Hops. However, these is no doubt as tiles get cheaper, and thorough-draining can be done at less cost, we shall have fewer open ditches; but 6*l.* or 8*l.* for draining an acre of land that is not worth more than 15*s.* to let, is a serious affair even to the landowners, who are sometimes as poor in their way as tenant-farmers. —*J. A. F.*

Game.—We have, in works on Agriculture, a great many useful statements respecting the cost per annum of horses, oxen, sheep, &c. There is, however, one kind of stock reared by us in great quantities, on the annual cost of which per head I can gain no information from any work that I have read. Now, correct knowledge on this point is of the greatest importance; it could be easily obtained at a moderate expense, and is in every way deserving the attention of the Royal Agricultural Society, and of every one feeling an interest in farming pursuits; and I hope and trust that the Society, or some patriotic gentleman, will bring the matter to the test of experiment. This might be done as follows:—Let two adjoining fields, A and B, be selected, and carefully protected from being trespassed upon by any of this stock. Let A be a Wheat-field, autumn-sown; B, a field of Grass or Clover. From each field let half an acre, C C, making together one acre, be fenced with wire lattice; then, immediately after the Wheat is sown, let *one hare* be turned into C C; at harvest, let the crops on C C be accurately weighed, and measured and compared with the other portions of the fields.

If, in consequence of your allowing this letter to appear in your valuable Paper, the above-mentioned or any other experiment is tried, and the cost per head ascertained, you will have conferred incalculable benefit on the farmer.—*A Constant Reader.*

Potato Crop Failure.—It is the generally received opinion among Potato-growers, that a Potato plant should be hoed very deep. Do you not think this has been in a great degree the cause of the failure this season, it being such a dry one? Around this neighbourhood many persons stop till the plant has arrived to a certain height before they hoe them; after this it is general to stay from three to six weeks before they mould them; this, in my opinion, is very much against the growth of Potatoes, for in the first place hoeing them deep (and in many cases when they ought to be moulding them), in dry weather the fibres will get stinted, or will lose most of their youthful vigour; in moulding, I think, great mischief must be done, in a dry season like our last. My plan is, whether it be a dry or wet season, for my Potatoes to be hoed one inch deep, when half of them are above the surface, and moulded when half of them will fairly stand against the moulding, which is a short time after hoeing. I have six different pieces this year, at six different places, and not one failure. My seedling ground I dig up in winter, and for common round Potatoes, I dig and plant in the beginning of March, and end about the latter part of April. I have experienced, to my sorrow, the effects of hoeing deep in a dry season; my plants have gone off—and what have remained, the fibres have got stunted in their growth. I have had, like some of your correspondents, plenty of blade, scarcely any Potatoes; by my present plan my Potatoes are not the least injured in their growth; I get abundance of blade, and very fair crops of Potatoes, quite proportionate to their blade.—*Frederic.*

Preservation of Implements.—Amongst the useful information contained in your Paper, I have not, during the six months I have been a reader of it, met with a word on a subject of great importance to the agriculturist: I mean the means which he should adopt to preserve his implements from the decay which is speedily induced by their constant or frequent exposure to sun and rain. I have found paint a poor protection—indeed I am inclined to think that to wood it affords none; for however well my carts, &c., have been painted, exposure to the sun cracks the wood in a thousand places, and opens so many doors for the wet to get in and rot it. My hurdles, when not in use, are carefully stowed away, but I find that before their second winter's work is done, the feet of the larger portion of them are rotten, and the hurdles, in consequence thereof, are comparatively useless. Kyan's solution of corrosive sublimate, Burnett's, of chloride of zinc, and Margary's of sulphate of copper, and other anti-corrosive preparations, have been mentioned to me by their respective advocates as a sure means of preventing rot, and preserving timber; but, having little knowledge of chemistry, I am unable to determine their respective merits, or which of them—taking all things into consideration, especially expense*—I should try. Perhaps, Sir, you will favour me with your opinion on the subject, or request some one of your scientific correspondents to do so, which will greatly oblige—*A Bucks Farmer.*

Stall-feeding.—I find it imposible to read the accounts in the agricultural publications of the day, of the malady which is now proving so destructive to horned cattle, without feeling a desire to contribute towards its abatement. I take the liberty of suggesting whether the immediate adoption of housing and stall-feeding of cattle may not prove a preventive, particularly if steamed food be used. The apparatus necessary for steaming, and its advantages and use, are now well enough understood to be easily set in operation. In 1812, and from thence to 1818, that extensive and excellent agriculturist, the late John Christian Curwen Esq., M.P. of Workington Hall, Cumberland, in communications to the Society for the Encouragement of Arts, Manufacturers and Commerce, demonstrated, and corroborated by the testimony of other agriculturists and dairymen who followed his plans, from having witnessed their success with him, the advantages of stall-feeding and steam-feeding both for cows for dairy purposes and cattle for fattening; with respect to cows, those advantages were, a great improvement in their condition, health, and milking; and their state after becoming dry, when a few weeks' feeding makes them fit for the shambles with very little loss from the first cost; with respect to stock, there were early maturity, diminished risk in rearing, a saving in the cost of feeding, besides the creation of an additional quantity of manure. In 1814 seventeen calves were reared—11 short-horned or Durham, and 6 Ayrshire; not one was lost, nor were they subject to any complaint; in size they were little inferior to those of double their age; so good was their condition that one of the Ayrshire heifers of 18 months old was butchered. The live weight was 55 stone, of 14 lbs. to the stone. The carcass was 31 stone 9 lbs., and the loose fat 2 stone 9 lbs.; it was killed at the meeting of the Workington Society, the carcass esteemed particularly beautiful, and the meat highly approved by the members who saw it. The Durhams were in much better condition, and would have killed 46 stone at least; all costly food was rejected; the produce of two acres, divided between Turnip and Clover, abundantly sufficient to support a beast till 2 years old; the manure created was considerable. Believing the facts here mentioned to be correct, as I find them printed and well authenticated in the volumes of the Society's Transactions, if the suggestion I have ventured to make should prove useful, I shall be much gratified, and only ask the result and details of any trial to be made known through your paper.—*J. S.*

Inorganic Constituents of Plants.—At page 676, you gave an abridged report, from the *Dumfries Courier*, of a lecture delivered by a Professor Johnston, at Castle Douglas; and in a table given in col. *b*, showing the quantity of inorganic matter in 100lbs. of hay, the Professor is represented as stating the amount in Rye-grass hay at 52.3 lbs.; Red Clover, 74.8 lbs; White Clover, 91.1 lb.; and Lucerne, 95.6 lbs. Here, I presume, there is an error in placing the mark denoting the decimals, and that the table really given by the Professor would be for Rye-grass hay, 5.28 lbs.; Red Clover, 7.48 lbs.; White Clover, 9.11 lbs; and Lucerne, 9.56 lbs. Correct tables of this nature are valuable to the intelligent farmer, for he is enabled, by them, to calculate the amount of each inorganic constituent removed from the soil by his crop, and by a corresponding analysis of manures, knows what is most proper to apply to restore his field to its previous fertility. In this lecture the Professor draws the attention of his audience to the disappointment which must follow the trial of any manure which is expected to prove a general specific; and from his remarks on this head, several of your contributors may also profit; as, in many articles I have read, a manure is lauded or condemned, according to the result of a given experiment, without at all taking into account the previously-existing composition of the soil. The difficulty of obtaining a correct analysis of the soil of the different fields of a farm, and the consequent expense, likewise, will effectually deter the majority of farmers from the attempt; and although this knowledge would be valuable, particularly in the improvement of naturally sterile soils, yet, with all fertile soils, the farmer may secure their fertility by restoring annually to the soil, in the form of manure, the same inorganic constituents which he has removed by his crop. It would be a useful plan, as has been suggested by Liebig in his "Chemistry of Agriculture," for the farmer to keep a farm-book, in which, devoting a certain portion to each field, he might systematically note the inorganic ingredients annually removed and restored. Land is honest, and will amply repay any judicious outlay; if a previously fertile soil has become unfruitful, such a book would clearly show it had been unfairly treated.—*G. B.—C.*

Expenses of Horse Labour.—In your last Number a comparison between the value of horses and oxen for farm work is made; but the calculation is based on a stock of horses declining in value. Perhaps many of your readers may not have read the work from which I offer the following extract: it is entitled "A Review of the Corrected Agricultural Survey of Lincolnshire," by Thomas Stone, London, 1800:—

Calculation upon a Stock of Horses declining in value, for a term of 21 years.

Dr.	£	s.	d.	*Cr.*	£	s.	d.
Ten horses, purchased at 15*l.* per horse, at 3, 4, and 5 years old	150	0	0	Value of ten horses at the end of the term of 21 years	150	0	0
Decrease of the value of each horse after 3 years of the term, at 1*l.* per head, for 8 succeeding years, with simple and compound interest on each sum	100	1	10½				
Purchase of one horse every year, for the last 10 years of the term, on account of losses through age and decay, at 15*l.*, with interest, simple and compound, thereon	197	16	0½				
Admitting that, for the last 10 years of the term, a horse is every year purchased, at 4 years old, to supply the place of one dead through age and decay, there will be 10 horses losing 1*l.* per head each, in the 12th year; 9 losing 1*l.* per head each, in the 13th year; 8 losing 1*l.* per head each, in the 14th year; 7 losing 1*l.* per head each, in the 15th year; 6 losing 1*l.* per head each, in the 16th year; 5 losing 1*l.* per head each, in the 17th year; 4 losing 1*l.* per head each, in the 18th year; and 3 losing 1*l.* per head each, for the remaining 3 years; with interest, simple and compound, thereon	79	11	5½	Balance against the farmer	377	9	4½
	£527	9	4½		£527	9	4½

Calculation upon a Stock of Horses increasing in value upon a farm of the same size, for a term of 21 years.

Dr.	£	s.	d.	*Cr.*	£	s.	d.
Twelve horses at 15*l.* per horse, upon an average of 4 years old; as it is intended to keep an improving stock, it will be necessary to have two supernumerary horses, always having two colts rising 3 years old, purchased every year, and two 7 years old horses making up for sale; but no allowance for the maintenance of the two supernumerary horses ought to be made, because a team of young horses do not eat so much, or require so much nourishing food as old horses, besides that their labour will amply compensate for their maintenance, by their utility in seed time and other strait times	180	0	0	20*l.* per annum, for 18 years, gained with interest simple and compound thereon, being the difference between the purchase of two colts rising 3 years old, and selling out two horses rising 7 years old	387	19	10½
The interest of 30*l.* per ann. simple and compound, for the whole term, being the cost of two supernumerary horses	52	15	5½	Value of twelve horses at the end of the term, at the improved ages	200	0	0
Balance in favour of the farmer	355	4	5				
	£587	19	10½		£587	19	10½

—*Lusor.*

Agricultural Facts.—A farmer in this neighbourhood put a large Potato, at the proper season of the year, into a heap of mould and ashes left the preceding autumn when the weeds and leaves of the garden had been burnt. It grew with great vigour, and at my request the plant was moulded up and was allowed ample room. In the autumn I took up the plant in the presence of several friends. The diameter of the branches was 8 feet; the number of Potatoes, without counting the very small ones, was 220; they more than filled a bushel basket, and weighed 65 lbs. The largest of the bulbs, 80 in number, were on the south side of the plant.—Some years since

* I observe that the expense per pound of the three articles mentioned above, differs very considerably, as does the expense of the licences to use them; but, perhaps, the expense is according to the efficacy of the article as a preventive of rot and decay.

my servant emptied the brine from a pickled pork tub, undiluted, upon the Grass lawn in my garden in the autumn. The lawn was originally laid with turf, taken from a wet unproductive heath adjoining Mr. Mechi's farm, just now of great celebrity. The consequence was the entire destruction of all appearance of vegetable life for the following summer, the patches looking like brown paper. The second summer a scanty show of feeble blades of Grass came up. The third year the patches were covered with a crowded plant of white Clover! and nothing else; and so vigorous was the growth, that I had them mown four or five times. Fifteen years have elapsed, the lawn has been regularly mown, and the Grasses have now overcome the Clover, but not entirely. The heath or waste from which the turf was taken, never shows a Clover plant, and probably has not for ages. I wish the lord of the manor would let this waste to Mr. Mechi; I think that gentleman would try to develope its productive and hidden mysteries. — *Henry Dixon, Witham.*

Stones on Land.—Pray, sir, may I be allowed to ask, in contradiction to the opinion of some of our would-be-thought farmers here, what utility stones are to the land? A farmer adjoining me will not allow one to be touched, whereas I have sufficient, which I rake off annually and cart away to supply the roads with. My crops are as good as ever—my friend's mostly weeds; in fact, his farm seems, to a casual observer, cropped with both weeds and stones.—*Verax.* [In shallow soils they preserve the moisture which in dry weather would otherwise soon evaporate.]

The Proper Direction of the Traces in Harness.—It is universally admitted that the best way of applying the power of horses is by means of shafts or traces, to carriages. The best position of the traces, or shafts, when a horse is made to exert himself to draw in a carriage, is so well known and understood by those who are daily in the habit of "hanging to," that it needs scarcely be noticed. The trace, when a horse leans forward to draw, should become perpendicular to the collar, and parallel to the plane of the road on which he is moving. In moving up a hill, the trace should become parallel to the plane of ascent. When he is standing at ease, the direction of the trace should be a little upwards; because, when urged to draw, he leans forward, and in doing so, he lowers the forepart of his body, which will tend to bring the trace parallel to the plane when his power is fully applied. If any deviation from the parallel be admitted, it is desirable such deviation should incline upwards rather than downwards. If the direction were downwards below the parallel, the power of the animal would have a tendency to increase the friction, by pulling the wheels into the cavities of the road. After contemplating on these remarks, the following suggestions present themselves:—The radius of the fore-wheels should be less than the height from the road to the point of draught on the shoulder of the animal. The shaft or pole should be hung on a level with the centre of the wheel. The least horse, or rather the horse of lowest stature in a team, ought to be selected for the shafts, and he ought not to be so low as to cause them to incline downwards towards the road. In selecting a team, the tallest horse should be placed first, and the others ought to be so placed as to descend regularly down to the stature of the shaft-horse, in order to preserve a continued ascent in the line of traction. If a regular line of ascent be not preserved, as it will not, by placing a low horse between two tall ones, it is not difficult to show that a portion of their power will be lost in acting against one another, and thus render their united effect not so powerful as it might be by a different and proper arrangement. To individuals acquainted with the elementary principles of Mechanics, these suggestions will appear natural and obvious; but, in practice, it is known that the temper, age, and steadiness of the animal mostly regulate the situation in which we find him placed in the team; and therefore deviations from the rule laid down respecting stature will often be necessary, and perhaps desirable. In teams of perfectly well-trained horses, the rule may be adopted with advantage. [From "Elements of Road Engineering, by a Practical Surveyor."]—*J. B.*

Cheese.—May I ask of you why is Dutch cheese always inferior in flavour, &c., to our English—has a bad sale always, and is at last driven out of the market by the American, the flavour and richness of which is so superior? I fancy the reason to be that their method of soiling their cows in house always, is the main cause of their ill-flavoured cheese and butter. Cut food given to cows never answers so well as the natural pasturing of the animal—so I have found, after several years keeping cows. Soiling cattle for the butcher is one thing, and the soiling of cows for their milk is another; although the animal lives and does well, and is quite healthy—for I have had them 5 years constantly in house.—*Delta.*

Manures.—I perceive in the wholesale prices of manures inserted in the *Agricultural Gazette*, the first article is alum 12*l.* per ton. Pray in what manner is this used as a manure, and to which crop? I have on my farm several lodes or veins of fullers-earth, particularly one in a coppice wood, which is very rich and good in appearance; but on dissolving it, it has too great a proportion of sand or silex I suppose in it, and therefore does not suit the fullers of cloth. Now, if alum be adapted for manure, there being so great a proportion of it in fullers-earth, could not the application of this I have so much of, be of service in agriculture? If so, pray do me the favour to say how it should be applied, and to which crop.—*Delta.* [Fuller's earth does not generally contain alum; see the notice of it in "Jameson's Mineralogy."]

Plantation on Sand-hills.—In an article dated Inverness, and apparently contributed by Mr. Anderson, Secretary to the Farmers' Club in that district, an interesting account is given of the attempt of R. Grant, Esq., of Kilcorth, to clothe his sand-hills with wood, and it seems in a great measure to have succeeded in spite of many obstacles. One great difficulty is fixing the sand, another is the ravages of rabbits, both common to all lands so situated. The best plant to grow is Sea Buckthorn—the botanical name I do not at this moment recollect. It is a native of the North East coast of Britain, and grows plentifully on the sea shore in East Lothian, where many acres of fine Wheat land in that rich district have been saved from being covered with sand, as may be seen near Lord Wemyss's, at Gosford, from whose liberality no doubt plants can be procured. It may also be propagated by seed, which in some seasons is very plentiful, but being once planted the difficulty is keeping it within bounds, as it spreads itself by runners and off-sets—rabbits will not touch it. The Sea-Buckthorn grows quite high enough to shelter young trees, as may be also seen at Gosford.—*M. D. P.*

Magnesia.—In the "Oxford Encyclopædia," article "Agriculture," I read—"By the application of magnesian earth to ground producing Sorrel, both the acid (oxalic) will be neutralised, and the oxalate of potash decomposed, by which means the alkali will be disengaged, and put into a situation to act upon and dissolve the inert vegetable matter in the soil. The salt formed by the combination of the magnesian earth with the oxalic acid will, as well as the vegetable matter dissolved by the alkali, be found to promote vegetation in a very high degree. By the application of alkaline salts to Sorrel, there results a salt fully neutralised, which also highly promotes the growth of more valuable plants and grain." Will you kindly assist me to apply these principles? 1st, What is this magnesian earth, and how am I to obtain and apply it? 2d, I hold a field overrun with Sorrel, which I have just ploughed; am I to harrow out and take off the Sorrel, or leave it to the operation of the magnesian earth? It is a Barley stubble, having previously had Wheat. 3d, The land is a sharp gravel, which has been exhausted by overcropping without manure, and is therefore very poor. I had thought of chalking the field about 4 acres, but I wish to try magnesia, which is said by the above authority to have a better effect, if you will inform me how to proceed.—*Tyro.* [Most limestones contain magnesia; some of those occurring in central England contain it in large quantities. You can use 50 or 60 bushels per acre of such limestone, burnt, and in a caustic state; let it slake under a thickish cover of your soil, and then spread it abroad and plough it under. We do not know how far the views of the writer you quote are correct: he means apparently that the plants should be allowed to live, but this is incompatible with good husbandry. You had better plough it all down together, and any potash salts which it contains, if they come in contact with the magnesia, will be decomposed. Manure well in spring, and grow some root-crop. About guano, see "Notices to Correspondents."]

Tile-draining. — The following observations were made at the Lytham Agricultural Association, by Wilson France, Esq., of Rawcliffe-hall. He said that, so far had he succeeded in making the pipe-tiles by Clayton's machine, that he could sell at 15*s.* per thousand, and might be able afterwards to sell them at 12*s.* Two men and three boys were able to turn out 5490 in one day. He now had at work at Rawcliffe one of Mr. Clayton's machines, and had made a few thousands with it. The length of the tile was 14 inches when burnt, and dried about a foot. Mr. Hammond had formerly used 1½ inch bore, but now used only an inch bore in all parallel drains; and he says that it is the opinion of all the farmers who have used them in the Weald of Kent, that a bore of an inch is abundantly large. Mr. Langston, of Sarsden, near Chipping Norton, in a Report on the number of pipe-tiles made in ten hours by a 7-inch cylindrical machine, says, that of 2¼ inches there were 4686, of 1¾ inch bore 5490, of 1⅜ inch 7570, of 1 inch bore there were 15,240. The work was done by two men and three boys. Taking into account the expense of labour and coals, if they would be satisfied with tiles of an inch bore, he would make them at 12*s.* per thousand. The weight of 1000 1-inch tiles was 1313 lbs.; that of those 1¼-inch in the bore, 1500 lbs. He burnt 22,000 of them in a kiln 12 feet long by 9 feet broad. He had taken 1500 in a one-horse cart; being of so small a bore, no vermin could injure it; neither mole nor water-rat could get into it. This was of great importance.—*Facile.*

Societies.

AGRICULTURAL CHEMISTRY ASSOCIATION.

The Highland Agricultural Society's Seed Wheat Competition taking place on Wednesday last week in Glasgow, a number of gentlemen, members of the Agricultural Chemistry Association, met at a public breakfast, when the following topics were arranged for discussion.—1st, the Smut in Oats; 2d, Why Seed-corn must be changed; 3d, Of the Steeping of Seed-corn. Professor Johnston said, by examination through the microscope, the smut was found to be a species of Fungus, and had obtained the name of Urido segetum. When nearly ripe, if they took a single grain of smut, they found it full of little round puff-balls or sporules, so minute that it required 2800 of them to cover an inch. These minute balls ascended through the plant, and if they looked at a section of a stalk of Barley, they could easily distinguish where they had come up—the tubes of the stalk were filled with black matter that came up through the vessels, affecting, of course, first the straw, and then getting into the ear, where it spread itself all over. After passing through the stalk, the smut fixed itself under the root of the flower, which it rendered barren, and as the grain approached perfection, the puff-balls became ripe and burst, showing black dust of very minute particles, so minute as to require about 1,100,000 of them to lie across a single inch. Such was the smut; it ascended through the circulation of the plant, fixed itself on the flower before it came forth, and finally took the place of the whole ear, and destroyed completely the grain. Now, how was the smut propagated? In the first place it was sown along with the seed. Very often it was so minute that thousands of the particles might attach to a grain of Corn, and yet not be visible to the naked eye; and it would at once be seen how easily these minute particles could be sucked in by the moisture and grow up with the plant. But another way of propagating smut was by the soil itself, so that in many cases where no smut was attached to the seed itself, it might yet be produced from being in the soil. Rye was never attacked by it, and Wheat seldom; Barley was frequently injured; and Oats most frequently of all. The Grasses in the hay-fields, and in the Corn-fields were also attacked and destroyed. Now, this being the case, they would easily understand how sound seed might be sown and yet smut produced. It was considered by some farmers who studied this question, that it would be impossible to extirpate the smut from this cause; but he considered that if all other sources of smut were removed, that cause of it which lay in the soil would not be a very formidable one. Some kinds of Oats were said to be more affected than others. It had been observed in every part of the country where he had been, that new seed was most liable to be attacked, but that the seed sowed the second year was not so much affected. He had seen a field sown with seed purchased in the Dalkeith market, and another field beside it sown with seed of the second year; and the first field was attacked with smut, while the second was free from it. A variety of important questions then came before them, on which information was exceedingly desirable. Had it, for example, been proved that the home seed exhibited less smut than imported seed? How was it that the evil affected so much so important a crop as Oats? Had the soil anything to do with it? Had the seasons any influence in producing it? Some people held that it prevailed only in dry seasons. Then, had the altitude of a place any effect? or was the evil influenced by drainage? Had the severity of the winter anything to do with the matter? Again, did the smut affect the quality of the crops? It was said in England that the wheaten flour was not injured in quality by it; were Oats affected in quality or were they not? Cattle did not like the straw affected with smut; were they from this to draw the inference that it was obnoxious? The great evil to the practical farmer arising from smut was, that it destroyed his crop. In some cases this season one stalk in every ten was affected. This was, of course, a matter of great importance to the farmer; but in addition to that, there arose the question, Was the quality of the grain affected? It was to be observed that before the grain was cut, almost the whole of the smut was blown away; but still there must be a good deal that inevitably adhered, though not visible. Rye and Wheat were naked grains, and therefore the smut was easily carried away; but in Oats and Barley, which were covered with a sheath, it was not so easily blown off, and some of it necessarily adhered. These were all matters on which it was hoped gentlemen present would supply every information in their power. He now came to the question how smut was to be prevented? They were aware that the ordinary method pursued was to make a good selection of seed—to take such seed as from experience was found least likely to be affected. The seed, too, was often washed, and by that means certain portions of the smut were got quit of. The third mode of prevention was by steeping, in which there were two objects in view, only one of which it was necessary to consider at the present moment. One object of steeping was to kill the black dust, so that it would not germinate; but another object was to make the grain grow better. Now, to kill the black dust, or smut, steeping in sulphate of copper, or blue vitriol, was widely adopted; also arsenic, old urine, common salt, lime-water, &c. An important question here arose. For instance, if Wheat was steeped in certain substances, it was found that the smut was prevented, and that the grain grew better and more rapidly; but the question was, Did the extinction of the smut arise from the fact that these solutions killed it, or was the plant made so healthy that the smut could not affect it? Some people believed that insects would not attack trees till they grew weak. Was this the case, and did the same thing occur with regard to crops? With regard to steeps, he might mention as a result of his own observation, that he was in Wigtonshire some time ago, and that at Balmindalloch there was a large field of Oats divided into several parts, and the seed doctored in different ways, some not being doctored at all, other portions being dressed with guano, &c., and others steeped in a composition which he had made up.* On looking at that field it was found that the grain to which nothing had been done was smutted, that which was dressed with

* The following Table is the composition referred to by Professor Johnston:—

Phosphate of soda. Sulphate of magnesia. Nitrate of potash. Common salt. Sal ammoniac, or a Sulphate of ammonia.	One pound of each in 10 gallons of water, to steep 300 lbs. of seed; the moist seed to be dried with gypsum or quick lime.

guano was also smutted, as was likewise a portion where Campbell's steep had been used; but there were only two or three stalks affected with smut in the grain steeped in the composition which he had employed. This was certainly not conclusive, but it was a matter worthy of consideration by farmers.—Mr. Rigby Wason said, when he first began the improvement of Moss-land he found the crops nearly destroyed by smut; by improving the soil, by collecting good seed, and by steeping, he got quit of the smut, and he had no smut for six years until the last, the cause of which he would explain. He submitted the seed to a strong steep of salt, strong enough to float an egg, and never permitted it to remain there less than twelve hours; sometimes he retained it in the steep from 16 to 17 hours, and never found any injury to arise therefrom to the seed. This year he was induced to try Campbell's mixture, wishing to ascertain the benefits derivable from it; he also used common salt, and a portion not steeped at all; when he found that which was not steeped had a few ears of smut, while the other two portions had no smut at all. He did not think Campbell's mixture any better than common salt.—Mr. Alexander, of Southbar, had never experienced so much smut as this year. All his seed Oats were affected; the sandy Oats were, however, worse than the Potato Oats, these being affected one in seven, eight, and ten, up to twenty.—Mr. M'Lintock, farmer, Lochinch, near Pollock, had steeped Oats in guano and water, and had no smut. He used 2½ gallons of water, and 5 lbs. 10 ounces of guano, to 1½ bushel of Oats. He steeped it 78 hours, and dried with ground charcoal. All his Oats were smutty, with the exception of the two lots steeped with guano. They were the sandy Oats.—Prof. Johnston in conclusion said, it appeared that it had not been the custom generally to steep Oats; again, where steeping had been tried by Mr. Wason and Mr. M'Lintock, it had prevented smut; it therefore just came to this, that the practical man in future must steep his Oats, just as he steeped his Wheat, in guano or in salt, or in that steep which he had himself brought before them, and which had proved successful in Wigtonshire. The learned Professor then referred to other important questions relative to the steeping of seeds, &c., but observed that they could not enter upon them on the present occasion, though he trusted other opportunities for doing so would arise.—Mr. M'Lintock said he fully intended to follow out the guano steep. He had tried five or six other steeps, but all had smut but the guano.

FARMERS' CLUBS.

Cardiff.—At the last meeting of this Club, Mr. David, the chairman, made the following remarks on the Deanston, or Frequent Drain System, as compared with Mr. Elkington's system. Mr. Smith, who had devoted so much attention to this system of draining, resided at Deanston, from whence it has taken its name, and, having brought it to such perfection, he may be considered the author of it. He was the manager of a cotton manufactory, which is driven by a stream of water running through this farm, and to secure which he was obliged to take the farm attached to it for a term of years; the extent is from 150 to 200 acres. After completing his cotton mill, his attention was directed to the improvement of the land attached to it, which proved to be a poor tenacious clay of very little value. Mr. Smith, therefore, became a farmer from necessity. He ascertained that his soil was wet from rain-water and not from springs, and he determined upon adopting a system of draining adapted for the occasion, which answered. The chairman's son had visited Mr. Smith, and examined his farm, which he found was now dry, and produced good crops, and he had ascertained that the land had been increased in value from about 15*s.* per acre to from 30*s.* to 40*s.* per acre. Draining was not new even in this part of the country, for he had seen a short time ago some draining tiles at some depth from the surface, in land cut up for a railway, which must have been there many years. In England draining had for some time been extensively practised, and had produced beneficial effects; but it appears their ancestors thought land was only wet from springs, and their attention was directed entirely to that object, cutting the drains in such a manner as would "catch the springs," as it was termed. They did not appear to have considered that the rain which fell had much to do with it, for all their operations were directed to the water from below and not from above. Almost the only authority on draining, which they had about 40 years ago, was Mr. Elkington, who published a work on the subject. He recommended, as the most effectual method of drying low-lands, to sink deep wells upon the system now termed the Artesian system, which was stated to dry up the adjoining springs. He also advised deep drains to be made into the adjoining high land, wherein it was considered that large reservoirs of water had accumulated. These were the principles of draining advocated by Mr. Elkington. Mr. Smith, on the contrary, considered that most of their land was wet from the rain which fell, and not from springs. The quantity of water which falls annually is far greater than is generally imagined. This has been recently proved in the clearest manner by experiments carried on, he believed, in Hertfordshire. It was ascertained by an ingenious contrivance what portion of the rain which fell was required to promote vegetation, and what was the extent of the surplus. The total quantity of rain which fell in the same situation averaged during the last eight years 26½ inches annually; a body of earth 3 feet deep was so placed as to admit the surplus rain-water which fell on it to run into another rain-gauge, and the result was that out of the 26½ inches which fell, the average amount which filtered through this body of earth was 11¼ inches, and was not required by the vegetation on the surface, which consisted of a thick covering of Grass, the remaining 15¼ inches having proved sufficient for this vegetation and for evaporation. This surplus of 11¼ inches must therefore be conveyed off, unless the subsoil is open and sufficiently friable to allow it to pass through it. One inch in depth of water was, he believed, equal to 100 tons per acre. If there is a surplus of 11¼ inches to be taken away when the fall is only 26½ inches, the surplus in this country must be far greater with an annual fall exceeding 40 inches. He, the chairman, had kept a register for about 25 years, and he had found that the average depth exceeded 40 inches; it had often exceeded 50 inches in some years, and in assuming 40 inches it would be below the mark. If, therefore, 15¼ is sufficient for vegetation and for evaporation, their surplus would be 34¾ inches to be drained off, but as it is probable that evaporation is greater when the earth is more saturated, perhaps 20 inches would be a fair average, which leaves 20 inches to be drained off from all their clayey soils or those the subsoil of which is impervious to water, otherwise it must stagnate in the land, and prove highly injurious to vegetation. Every inch of water being equal to 100 tons per acre, 20 inches would be 2000 tons. He believed a gallon weighed 10 lbs., consequently this would exceed 7000 hogsheads as the amount of surplus water which fell in this country upon every acre in the course of the year. He therefore thought that they would agree with him that the evil was from above and not from below, and consequently their attention should be directed to the best and most effectual mode of taking off this surplus, in preference to making deep drains at very wide intervals for the purpose of catching the springs. As the rain falls evenly over all the field one large deep drain was not so likely to remove the evil as numerous smaller ones. There are no doubt various situations where land is wet from springs, but his opinion was that by far the largest portion was otherwise, and that nine-tenths of the wet land in this country is so from the subsoil being impervious to water, and will not admit this surplus to pass through it. Again with regard to the last mode of removing this surplus, let them copy nature as closely as they can. In dry friable soils, the apertures below are small and innumerable, and so ought to be their artificial apertures, and placed at some depth from the surface. If they took a section of the land after it is drained with drains 20 feet apart and 27 inches deep, and allowing 7 inches for cultivated land, the drain would be 21 inches below the surface of the subsoil; this would give a fall of only 1 in 6 from the centre of the space between the drains, but if the drains were 31 inches below the subsoil, the fall would be 1 in 4. Again, if the distance between the drains was extended to 30 feet apart, a cross section will show the fall to be only 1 in 9, which is not sufficient to draw off the water through the soil as quickly as it should be; it has also been found that drains at 40 inches deep will drain off more water from the same land than shallow drains at 27 inches, which must arise from the greater fall, but at all events they must not be too far apart. With regard to the expense, he was sorry to say, that it has formed a serious obstacle, for if done properly with tiles and soles the expense has not been much less than 8*l.* per acre; this would be for drains at 18 to 20 feet apart, which is near enough for the wettest land. He had paid more himself in some instances, where he had added about 6 inches of broken stones on the tiles. The tiles were procured from Bridgewater, and the carriage formed a serious item. The invention of pipe-tiles he considered to be a mode of reducing the expense very considerably, which renders soles unnecessary, but they ought to be made on every farm, or very near, to save haulage, and he hoped soon to find that the wettest land might be well drained for about 4*l.* or 5*l.* per acre. Draining should be up and down the land, as it would drain much quicker. If cut, according to the old system, in a slanting direction, the water must travel from the edge of one drain across the whole space into the other; but up and down the slope the water would be divided, and get into the drain in half the distance.—The Rev. James Evans said that he did not think the two systems of draining—viz., the Deanston and Elkington—had been sufficiently contrasted. Elkington had recorded in his work astonishing effects of some drains he had made, and of springs which were tapped. They probably had heard of a coal-pit sunk in Gellygare, which had dried all the springs in the neighbourhood. The effect of frequent drains is very trifling in comparison to these. But he contended that there was no one system of draining applicable to this county. There was in the neighbourhood wherein he resided, and through the vale of this county in general, a large extent of the lias formation, which consisted of alternate beds of clay and rock. He found from some surface and deep drains which he had cut, that the water did not penetrate the first layer of rock; he was, therefore, satisfied that it was quite useless on such soils to make any but surface drains. He had a deep gutter passing through his garden, on the side of which he had holes made for fixing posts; these holes became filled with water, and continued so until absorbed by the atmosphere, although within 4 feet of the drain alluded to. The soil in dry weather cracked excessively.—Mr. Goddard thought that the two systems in question were for totally different objects. He had been that morning in a field which was kept wet by a spring at its upper side. In that case one drain on Elkington's principle would more effectually dry the field than any number of frequent drains; and in draining it on the Deanston system, the whole field would be intersected by drains, although, with the exception of the part where the spring showed itself, the soil was naturally dry. Now he was convinced that dry land would be injured by being drained, as the manure applied to the surface would be washed into the drains.—Mr. Booker observed that no one system of draining could be with success universally adopted, especially in this county, on account of the variety of causes which contributed to the wetness of their soils. The chairman had stated that the quantity of rain which fell in Hertfordshire, on an average of 8 years, was 26½ inches, and that it amounted in this county to 40 inches. Now, this quantity—it appeared from the experiments that had been referred to—was so much greater than was required by cultivated plants, that it became requisite to adopt some means for conveying off the superabundance which fell in every case where the soil and subsoil were not sufficiently porous to admit it to pass freely beyond the roots of plants. The consequence of not attending to this was fatal to a proper system of cultivation, and ruinous to the soil. It was eminently necessary, in determining what system of draining to pursue, to discover the origin of wetness.—Mr. Williams considered the Deanston system applicable to all descriptions of soils. He could not agree that injury would arise from drains being continued even through the driest soils, as in such cases no water would reach them, till the soil was well moistened, if made 30 inches deep. Frequent drains he thought more certain of drying lands affected by springs, at a depth from the surface sufficient for agricultural purposes, than a deep drain on Elkington's system. Part of the Deanston system was to subsoil the land after draining to the depth of 16 or 18 inches at right angles with the drains; this operation materially assisted the draining, as the water at once sunk that depth from the surface, and was gradually admitted into the drains through cracks or worm-bores.—After a desultory conversation among other members, it was determined to resume the subject at a future meeting.

Miscellaneous.

Report of the Thorough-Draining executed on the Estate of Edward Lucas, Esq., Castle Shane, Monaghan, by Fitzherbert Filgate, Esq.—The next field drained was done at the same rates, exactly as the preceding; and the observations made with respect to the one apply to the other, excepting that in this case the main drain was cut for 3¾*d.* per perch.

No. of acres in field.	No. of perches of small drains.	Price per perch.	No. of perches of main drains.	Price per perch.	Total cost of field.	Cost per acre.
A. R. P.		*s. d.*		*s. d.*	£ *s. d.*	£ *s. d.*
5 1 2	949⅗	0 4 11/16	60⅘	0 3¾	19 9 8	3 14 0

The water from these fields is carried away by the flagged sewer already mentioned. The next field, containing 2A. 2R. 13P., is part of a field adjoining one of the approaches to the house, which was exceedingly wet, and covered with rushes. It was necessary to make a great length of main drains to carry off the water to the stream at the bottom of the field, which makes the expense much more considerable than it would otherwise have been; but if the remainder of the field should be at any future time taken in hand, this length of main drain would become available for it. The prices paid were, cutting, filling, breaking stones, &c., 3⅛*d.* per perch for small, and 7½*d.* for main drains. The stones were quarried in the demesne for 1⅛¾*d.* per perch, and drawn to the field by the farm-horses. The money paid was:—

No. of acres in field.	No. of perches of small drains.	Price per perch.	No. of perches of main drains.	Price per perch.	Total cost of field.	Cost per acre.
A. R. P.		*s. d.*		*s. d.*	£ *s. d.*	£ *s. d.*
2 2 12	448⅕	0 4 17/32	110⅘	0 7½	11 18 5	4 12 4

Parts of two fields, lying near a stream, containing 1A. 3R. 11P., were drained: the stones laid down by the farm-horses. As the ground was very soft, the main drains were cut at the same rate of small ones, 3⅛*d.* per perch. The outlay was as follows:—

No. of acres in field	No. of perches of small drains.	Price per perch.	No. of perches of main drains.	Price per perch.	Total cost of field.	Cost per acre.
A. R. P.		*s. d.*			£ *s. d.*	£ *s. d.*
1 3 11	295	0 3⅛	—	—	3 16 11	2 2 6

We finish with the field containing 5A. 1R. 2P. The soil is a rich heavy loam, of great depth; so deep, that in many places at the bottom of the drains we had not come to the subsoil. The price paid for cutting and filling drains and breaking stones was the same as before, 3⅛*d.* per perch; the stones were bought at 3*d.* per ton, 210 tons being used. They were carted more than one Irish mile, in carts hired at 2*s.* 6*d.* per day for cart, man, and horse. The cost of the stones when laid down in the field was 4½*d.* per perch. This and a preceding field were the only cases in which, under peculiar circumstances, the stones were attempted to be provided otherwise than by contract, and, as appears from the table, with an increased expense of from 25*s.* to 30*s.* per acre. The main drains cost for cutting, &c., at the rate of 3⅝*d.* and 5*d.* per perch, according as they required to be cut unusually deep or not.

No. of acres in field.	No. of perches of small drains.	Price per perch.	No. of perches of main drains.	Price per perch.	Total cost of field.	Cost per acre.
A. R. P.		*s. d.*		*s. d.*	£. *s. d.*	£ *s. d.*
5 1 2	606	0 7⅜	{ 82 / 26 }	{ 0 9½ / 0 8 }	29 1 9	5 10 6

It may be observed generally, that the circumstances attending the execution of the several works have been more unfavourable than should be calculated on, if compared with other localities, all the stones used having been quarried, with the slight exceptions mentioned. The nature of the country being hilly, has in many cases made it necessary to provide for the discharge of water, unconnected with that to be voided from the field drains; for which reason the main drains have been of larger dimensions than would otherwise be required, while the smallness of the inclosures has also occasioned additional outlay. The great expense being the drawing and procuring of stones, the cost will depend chiefly on the difficulty or facility with which they may be provided. In some cases when the drawing of the stones was performed by the farm-horses, the value of their labour and that of the men employed must be added to the amount stated. It would not be possible to name the exact sum, charging the man and horse at 3*s*. per day, or any other sum, as the stones were laid down at intervals as suited our convenience. There is in all farms where there is not much summer fallow, a period at that season, during which all the horses are not employed at the ordinary routine work of the farm; if this opportunity be taken, being the best season for laying down stones in the fields to be drained, no expense is entailed by their employment. A calculation may, however, be made by adopting the prices of any one, or taking the average of those fields, where the stones were provided by contract, deducting the amount paid for quarrying for those fields to which the stones were drawn by the farm-horses. I have thought it better, however, to state all the expenses as they actually occurred, rather than make any speculative return. I subjoin a tabular statement of the whole—

No.	No. of acres in field.			No. of perches of small drains.	Price per perch.	No. of perches of main drains.	Price per perch.	Total cost of field.			Cost per acre.

	57	2	13	9095 1/5	—	962 1/5	—	269	11	4	—		

In addition to the above, there have been 3528 perches of small drains, and 302 perches of main drains made on Mr. Lucas's estate, in the years 1842 and 1843, for which the tenants were allowed 1 9/16 *d.* per perch for the former, and 2 1/2 *d.* per perch for the latter. The drains were all finished as before described, and made eighteen feet apart. There being 186 perches to the acre, exclusive of main drains, when the drains are eighteen feet apart, it will appear there have been nineteen acres drained by tenants. —*Signed, F. Filgate, for E. Lucas, Esq.* [*From the Report of Agricultural Imp. Society of Ireland.*]

Notices to Correspondents.

Agricultural Gazette.—*Ed. M.*—Thank you for your suggestion; it would moreover be difficult to classify such mingled matter as we receive. We must depend on our Index at the end of the year for a classification of the contents of our volume.

Allotment System.—*L. C.*—We have received your papers, and are much obliged.

Alum.—*Delta.*—We are not aware that it is an ingredient, to any extent, of fuller's earth. The properties of this substance as a cleanser of oily cloths depends on the peculiar condition of the alumina it contains. We never saw alum used as a manure, and cannot believe that it can be economically applied; for any of its ingredients may be had more cheaply in other substances. Thanks for your offer about Potato-culture, which we gladly accept.

Books.—*A Welshman.*—Hillyard's "Practical Farmer and Grazier."

Campbell's Steeps.—*H. C. S.*—Upon the whole, the experience of farmers and others this year, so far as has been reported to us, has *not* been favourable to their use. How far this is a consequence of the season we are unable to say. We shall have a few remarks to make on this subject shortly.

Chalking, &c.—*Landlord.*—Chalk may be most beneficially applied to clay soils; and, even in the small quantities to which its use on the dunghills, in the manner you propose, will amount, it will probably do good. It is a good plan to have farmyards with slightly basin-shaped and impervious bottoms; a tank, considerably larger than what you name, should be dug in the centre, and by means of a pump you can spread its contents over manure heaps when fermenting, and just before carrying to the field. See Hannam on "Waste Manures." One of the most practical works on Drainage is a tract by Mr. Smith, of Deanston, on "Thorough Draining," We give our farm horses Carrots, Oats, and straw. Will Carrots do for carriage horses? If so, they will help to eke out your stock of hay.

Coal-ashes and Sea-sand.—*J. B. H.*—Asks for the results of experience in the use of these two substances.

Cows.—*M. D.*—The best root to give them, so as to make them yield rich milk, is the Parsnip. Oil cake is the best food you can give them in addition to this and hay; and in small quantity, say 2 or 3 lbs. per day, it might be profitably used; this with 20 or 30 lbs. of Parsnips and hay *ad. lib.* would be as good feeding as a dairyman could desire.——*Eskdale*—The case is uncommon, but now and then occurs. We believe that it arises from the wants of nature not having been satisfied, through the usual signs of this want not having been observed.—*W. C. S.*

Disease in Pigs.—*A. E.*—The loss of the tails in young pigs is mostly confined to those of the pure Chinese variety, or pigs, in which this breed strongly prevails. It arises from the imperfect development and want of vigour in these appendages, which is in keeping with the thinness of the skin and the hair peculiar to this breed. With regard to the case of palsy, try as an experiment, quarter of a grain of strychnia, in addition to the medicine previously given, once a day. *W. C. S.*

Diseased Wheat.—*W. Amys.*—The disease of which your ear exhibits a specimen, is called Bunt, Smut-balls, or Pepper-brand. Its cause is a parasitic fungus, the mode of whose action is similar to that of the fungus which produces smut. See report of Ag. Chem. Assoc., and Professor Henslow's report on the Diseases of Wheat, second vol. of the "Agricultural Society's Journal." Your remedy is thoroughly to cleanse the seed; and this is done by floating it in a strong solution of salt, and afterwards drying with lime.—*Brenchley.*—Your specimen contains what are called Pepper-corn grains. See Professor Henslow's Paper on Diseases of Wheat, in the second vol. of the "Agricultural Society's Journal." If you moisten a grain for half a minute in your mouth, and cut it in halves on a strip of glass in a drop of water, a very low power of the microscope will suffice to show the white substance it contains to be a mass of the *vibrio tritici*—a curious eel-shaped animalcule, which will gradually revive and twist about.

Farmers' Clubs.—*A Subscriber* asks What are the nearest Farmers' Clubs to Fulham and Putney?

Fireclay as Manure.—*I. H.*—The results of this experiment were certainly (looking at its composition) not the consequence of the manure employed. The experiment was too small in extent to inspire confidence. In such limited trials co-existent circumstances are frequently erroneously understood as standing to one another in the relation of cause and effect. Perhaps it might have been as well not to have published this experiment; but it is impossible that one ignorant of the circumstances in which the various experiments which are reported to him were tried, can be qualified to select or reject; he must hope, in the number of facts he publishes, that opposite errors will neutralise one another.

Guano.—*Tyro.*—You had better plough and sow Wheat now, and sow 3 cwt. mixed with its weight of earth, broadcast, over the young plants in April, and harrow it in.

Harvesting Carrots.—*H. S.*—See Leaders of next and last week.

Inundation.—*M. D. P.*—Your Grass-land that has been inundated from the sea, might, perhaps, be benefited by a coating of lime. In this we do not speak from experience; perhaps some of our readers can help you.

Plough, &c.—*Q. Q.*—Your safest plan is to employ the best constructed implement already used in your neighbourhood. The Scotch swing-plough, in the hands of a man accustomed to swing ploughs, is a most efficient implement, but it will not do to put it into the hands of any wheel plough man. Etheridge's tile machines are excellent, but there are now so many copyists from him, that we cannot presume to select from them. It is probably your interest to use foreign oil-cake; it may be crushed by the common cake-crusher, and so mixed with Barley-meal. How would it answer your purpose to feed your cattle on Mr. Warnes's pudding? See former papers on the subject by Mr. Sproule.

Potatoes.—*Woodstock.*—When these have been left in the ground for seed, it has been done simply by not disturbing the drills in which they were grown. Harvest the tubers in February or March, instead of in October, and use them as seed in the usual manner, at the usual time.

Samples of Oats.—*G. M.*—Your samples are so nearly alike in appearance that we cannot judge between such small quantities. Weigh *a bushel* of each, and let that be considered best which weighs heaviest.

Scab in Sheep.—*R. L.*—Amongst a variety of applications which have been employed for this disease (see Spooner's "Treatise on Sheep"), the following will be found as efficacious as most of them, and extremely safe:—Take sulphur powdered 1 lb., oil of tar ½ lb, palm oil 2 lbs.; the two former ingredients to be gradually mixed, and the latter then rubbed down with them. To be well rubbed in to every affected and suspected part, and repeated every three or four days till the disease disappears. With regard to prevention, all we can say is—avoid contagion and poverty; watch narrowly, and separate the diseased from the sound sheep as soon as the least itching is exhibited.—*W. C. S.*

Sea Mud.—*M. D. P.* asks How he is to bring land, newly inclosed from the sea, into cultivation? We think he had better give it a summer fallow, ploughing it deeply into narrowish ridges, manuring it well with half-rotten dung; he may sow Wheat in the autumn. We should be glad of the experience of our readers on this subject.

The Barbadran.—*Subscriber.*—Your articles are skilfully compiled, and seem calculated to do good. We think they deserve publication.

To Readers.—*A Constant Reader* asks where the following quotation originated?—"The man who makes two blades of Grass to grow where one only grew is a benefactor to his country."

Wheat.—*T. S.*—Guano is the best substitute for farm manure; you had better apply 3 cwt. in April, mixed with an equal quantity of dry earth. Sow it broadcast over the young plants, and harrow in. Do this in showery weather if you can.——*Brenchley.*—We prefer sowing our Wheat when the soil is wet, *i. e.* when it is so damp that a horse will leave a good deep footstep in it. Our soil is sandy; on clay soils it may not be advisable to sow so wet as this. When we have not so much matter on hand as at present, we may perhaps give information on the analysis of soils; meanwhile we may direct you to a chapter in "Johnston's Lectures on Agricultural Chemistry," on the Analysis of Soils, and to a work by Mr. Parnell on the general subject of Chemical Analysis.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, Oct. 21.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3*s*	1*d*	to 4*s*	0	Best Downs & Half-breds	3*s*	10	to 4*s* 2
Best Short Horns	3	8		3 10	Best Long-wools	3	8	4 0
Second quality Beasts	2	8		3 4	Ewes and second quality	3	4	3 8
Calves	3	4		4 4	Pigs	3	4	4 4

Beasts, 3849; Sheep, 30,010; Calves, 97; Pigs, 348.

Although we have an increased supply of Beasts, the demand is fully adequate; indeed the best qualities in many instances are making more money; several of the first-rate Scots, &c. realise 4*s* 2*d*, and Shorthorns 4*s* per 8 lbs, yet these are quite the extreme prices, and cannot be quoted as averages; inferior Beasts are more readily disposed of, but they still make very little money; very few remain unsold. The quantity of Sheep being not quite so large to day, there is a brisk trade at an advance of about 2*d* per 8 lbs on the best qualities. Calves are less in number, yet the trade is not much improved—it must be very superior quality to make 4*s* 4*d* per 8 lbs. Pork trade is steady.

Friday, Oct. 25.

Our supply of Beef to day is rather larger; there is not much business doing, and it is difficult to maintain Monday's quotations, although it is done for the best qualities, which make about 4*s* per 8 lbs; middling Beasts 2*s* 8*d* to 3*s* 4*d*. The late briskness in the Mutton trade has caused rather a larger supply to day; the prices are a little lower than on Monday; best Downs, &c., make a trifle over 4*s*, and Longwools rather more than 3*s* 10*d*; Ewes are not very saleable, they make from 2*s* to 3*s* 6*d*. Veal-trade is very heavy; the best Calves cannot be quoted at more than 4*s*, and middling quality 3*s* to 3*s* 8*d*. Pork-trade is worse; it has been sold at very low prices in the dead market this week.

Beasts, 880; Sheep, 4080; Calves, 269; Pigs, 370.

41, West Smithfield.

POTATOES.—Southwark Waterside, Oct. 21.

There is nothing in this Market at present that requires comment; every description of goods is going off heavily at the following quotations. The arrivals at the close of the week were considerable, and it is to be feared that they will cause a further depression in our prices
